The Whaley-Dwyer Co., 108 South Robert street, St. Paul, Minn., believes that long controversy on the subject of the conflicting patent rights and privileges in the matter of the stirrup form of toe clip would be valueless to all parties concerned, and is willing to let the matter rest with the courts. In the meantime, however, the company assures all dealers that it will protect its customers against any loss occasioned by handling the Whaley stirrup toe clip, and at the proper time and in the proper place will take the necessary steps toward fully protecting its manufacturing rights.

#### EXCELSIOR SUPPLY CO.'S CATALOGUE.

The newly issued catalogue of the Excelsior Supply Co., 88 Lake street, Chicago, contains one hundred pages of carefully compiled illustrated matter descriptive of the line of cycle fittings and parts which the company keeps in stock with a view to maintaining its original intention of supplying everything for bicycle builders and dealers. Patrons of the house not finding desired articles catalogued are requested to

# CYCLE AGE ADVERTISES

## PROFITABLE ADVERTISING

Continuous versus Spasmodic Effort Discussed by an Expert.

The following advice is tendered by Charles Austin Bates, one of the best of advertising experts:

Don't try to make a man preserve your ad. Send him one today for the impression that it will make on him today. Let him throw it into the waste basket as quickly as he pleases. If you want to make an impression on him tomorrow send him another, and don't tie a chromo on it to make him preserve it. Stick to business. Talk about your business to the exclusion of everything else. Tell a little illustrative story if you want to, put in a pretty picture

if you want to, but make it all about your business, and don't add expense to it in the effort to get it preserved.

A man told me some time ago that a series of circulars he had been receiving didn't stand very high in his estimation. He said that as soon as he read them he threw them all into the waste basket!

Why not?

The business of a circular is to get itself read. After that its proper place is in the waste basket.

I don't want anybody to save my circulars. There's no necessity for it. If I really want a man's business I will send him another circular, and another, and another.

Make an advertisement or a circular striking enough to get attention at the time it is received. If you get it read once, that's all you can expect, and all you ought to expect.

You don't expect people to frame the letters you write them and use them for deco-

orative purposes. Why should you expect them to be more considerate of a piece of printed matter?

If you talk business to a man over the telephone, you don't expect him to receive your remarks into a phonograph and use it to talk to himself for a year or two.

No, sir, you telephone the man today and talk to him, and if you don't get him, you telephone him again tomorrow, or next week.

Just the same with newspaper advertising. Tell the buyers your tale today and impress with what you have to say. They won't all come and weigh in with the orders within seven days, that's certain. Therefore tell them your story again next week. Vary it a little and make it attractive, but, above all, be business-like and make an impression.

## The Value of Originality.

It is a well-known fact that most of the circulars sent to busy men nowadays are consigned immediately to the waste basket, without so much as a hasty perusal. A London firm, realizing this, got around the difficulty by printing the following on the envelope: "Caution: Remove the envelope carefully and exercise still greater care in handling the enclosed circular. Don't throw it in the waste paper basket or give it to the servant to light the fires with, as the most disastrous results will follow, inasmuch as the circular is dipped in a solution of dynamite, the most powerful explosive known. Hang it up in a cool, dry place, and, after a few days' exposure, its dangerous properties will disappear and it can be burned like any other circular." Then, at the lower edge of the envelope, was printed: "N. B.—Most firms do their heavy lying in the circulars; we alone do all of ours on the envelope."

## A SAMPLE PAGE FROM "MODERN CYCLE REPAIRS."

It will be ready on Thursday, March 16. 160 pages and 100 Illustrations, handsomely bound. To Cycle Age subscribers, \$1.00. To others, \$2.00. Cycle Age one year and Modern Cycle Repairs, \$3.00.

Smashed and broken tubes may be mended in three ways. The common and simplest way is to cut out the smashed place and splice the tube by inserting a solid plug or a piece of tubing as shown at A in Fig. 14. This is a very quick way of doing the work and one which requires no expense but that of labor. It has its disadvantage, however, in that it sometimes casts a reflection upon the repairer's mechanical ability.

If the frame in building has been sprung into line, or if any of the tubes in any way have an irregular tension, the result shown at B in Fig. 14 is liable to follow the splicing of a tube. The plug may be put in all right, and to all appearances the splice looks as if it would be a success, but when the brazing is being done the tube may spring out of line at the splice. It is of course possible to pull the tube straight after it has been cooled, but in nine cases out of ten when such a course is followed the first heavy shock given the frame by the rider will cause it to spring out again. This means that the bicycle will be brought to the shop with a complaint, or that the owner will forever after shun the shop.

The second way of repairing an injured tube is to replace it. This is the most expensive way, but it leaves the frame as good if not better than it was before the injury took place. It costs the price of a new tube, and requires some work in removing the old tubes from the lugs. So another way has been tried by repairmen.

This third method is shown in Fig. 15. It calls for the use of some new tubing, but the work of putting it in is lessened. The old tubing is cut off close to the joint, the stubs being marked a in the illustration. The new length of tubing, c, is cut to fit in between these stubs. Plugs of solid iron rod or of tubing are then driven inside the old tubing stubs and pretty well into the connecting lugs. These plugs, b, project as shown. The tube, c, is then slipped on over them and brazed in place.

Splicing of Tubing

Fig. 14

To Avoid Springing Tubes

## THIS POOR MAN

was selected to get at the ins and outs of the "KICKS" resulting from our offer of \$25 to the subscriber who furnished the best reply to our questions concerning the improvement of CYCLE AGE.

The prize has been awarded to Mr. H. P. Winn, of Boston, to whom check has been forwarded.

The CYCLE AGE tenders thanks to all the subscribers who took advantage of the opportunity to offer suggestions, the value of which is freely acknowledged.

If an anonymous correspondent at Cleveland will send his name and address it will give us pleasure to reply to his question.

## SATISFIED ADVERTISERS.

After considering all the trade journals on the market we have come to the conclusion that your paper reaches the best class of trade in the United States.

THE CARLISLE MFG. CO.,  
69-71 W. Jackson Boul., Chicago.

order materials needed, and the order will be filled even if the company is compelled "to make the articles."

#### GREAT ACTIVITY AT POPE'S.

All departments of the Pope Mfg. Co.'s factories are now running twenty-two hours daily and the combined Pope interests are furnishing employment to about 4,000 men. Word comes direct from the company that the demand for its bicycles at the 1899 prices is unprecedentedly large and for weeks close to 1,000 machines have been shipped per day. Many orders are being received for the chainless.

All rumors to the effect that the Pope company will employ a racing team this year are contradicted at the offices of the company.

#### PRACTICAL TRIBUTES TO MERIT.

One of the best proofs of excellence of a firm's product is the retention of old trade. Continued selling to new buyers often yields good financial results, but manufacturers are generally better satisfied when their old buyers place second and third orders on the same products. Such is the experience of the Cycle Components Co., 13 Maiden Lane, New York city, which states that with hardly an exception early purchasers of its C. C. C. and Alvin pedals are placing repeated re-orders for the goods.

#### CONQUEROR WALL HANGER.

The Mechanical Fabric Co. of Providence, R. I., which makes the well known Conqueror single tube tire, is sending out to the trade copies of a highly artistic wall hanger, the distinctive illustrative feature of which represents the entrance to the harbor of Santiago de Cuba. The illustration is a reproduction from a drawing made from an original photograph, bringing out vividly the exact detail of the defences at the harbor entrance, where several of the most prominent scenes in our late war with Spain were enacted.

#### BRISTOL BELL CO.'S NEW DESIGN.

The Bristol Bell Co. of Bristol, Conn. has recently produced a new bell top design which is styled the Berlin. The upper of the

two illustrations herewith is a direct top view showing the richly ornamental relief work in the design. The finish is a new silver effect, as an aid in attaining which the sand blast is used. The finish obtained is not only very rich, but is lasting. The lower illustration shows a complete Peerless pattern bell finished in the Berlin design.

Another new feature of the Bristol company's bells is the adjustable lever applied

to the Peerless and Corbin patterns. It obviates the necessity of an awkward location of the bell on the handle bar in order to bring the thumb lever within easy reach of the hand. The lever is adjustable to any position without the use of tools. The convenience of this will be appreciated by those who have tried to fit bells to handle bars having unusual curves.

#### WORKING DAY AND NIGHT ON CHAINS.

For the last four months the plant of the Indiana Chain Co. in Indianapolis has been

running full time on the production of its well known and popular Indiana chains. The company states that it has all the business it can take care of for the present and that it is running the factory nights to keep abreast of the tide of orders. A heavy call for its No. 4 Baldwin pattern chain has set in and this style bids fair to eclipse all of its other patterns.

#### EXTENSIVE CRAWFORD LINE.

The Crawford Mfg. Co. of Hagerstown, Md., is adhering to its well tried policy of producing a large line of bicycles in order to meet all of the different demands of pur-

Model 53—Weight, 25 lbs. Price, \$25

Model 49—Weight, 23½ lbs. Price, \$30.

Model 58—Weight, 25 lbs. Price, \$50.

Model 54—Weight, 26 lbs. Price, \$25.

chasers and to thus enable its agents to sell Crawfords exclusively without having to fill in their lines with machines of other makes.

Models 58 and 59 are respectively the women's and men's \$50 road machines, and embrace those structural points held in highest esteem in the Crawford factory. Model 57 is a road racer selling at \$50. The machine is distinctively for the scorching fraternity and no women's model to match it is made. In Models 69 and 70 the dealer is offered a pair of staunch, reliable \$35 bicycles which have the style of the times. With the purpose of supplying a machine of the road racing type which will still sell at a popular price, Model 67 is added to the line. It lists at \$35. The \$25 patterns are Models 53 and 54, and while the Crawford company does not claim broadly that they are the acme of cycle building, it states that for the price the machines are the best which the long experience and ample facilities of the firm enable it to produce.

Besides these regular models, the Crawford Mfg. Co. builds two tandems listing at \$75 each, a pair of bevel gear chainless machines at \$65 each, two road machines at \$30 each, and several cheaper models more or less similar to different ones of the models mentioned. The policy of this firm is too broadly known to make it necessary to mention that the options in fittings and equipments on the various patterns are as liberal as can be consistently offered.

#### PARTRIDGE & CO. RE-LOCATE.

Horace Partridge & Co., of Boston, makers and importers of athletic goods, will move on or about March 10 from their present location, 55 Hanover street, to the corner of Franklin and Arch streets, where commodious quarters have been secured. They expect to have an opening about the middle

of March and will give their undivided attention to the sale of bicycles, sundries and athletic goods.

#### MAKES FULL LINE OF JUVENILE CYCLES.

Boys' and girls' bicycles in four sizes each, selling at moderate prices, are now being manufactured by the Speed Mfg. Co., 71 West Jackson street, Chicago. The machines are made with 16, 20, 24 and 26-inch wheels and list respectively at \$19, \$20, \$22 and \$23. The frames are built from 1½-inch tubing with flush joints and oval fork crowns. Standard fittings in proportion with the sizes of the models are used and each pattern has the appearance of a thoroughbred cycle for young America.

#### COASTER-BRAKE INFRINGEMENT SUIT.

To the Editor:—The Eclipse Bicycle Co. have filed a suit against the Globe Cycle Works, of Buffalo, for infringing their patents of the Morrow coaster and brake. This suit will be prosecuted with vigor, and the Eclipse Bicycle Co. are confident that an early decision will be rendered in their favor, as the patents on the Morrow coaster and brake are very strong. The trade will please take notice.

ECLIPSE BICYCLE CO.

#### WATSON POST PATENTS ALLOWED.

L. E. Crandall of New York city has been granted a patent on the automatically adjustable seat post manufactured by the Watson Automatic Seat Post Co. of the same place. The construction specified in the patent is substantially that of the Watson post now in the market. The patent is of course assigned to the Watson company.

The Ellwood Ivins Tube Co.'s plant at Oak Lane Station, Philadelphia, is running twenty-fours a day or cold drawn seamless steel tubing. This company is said to be the first in America to produce such tubing.

F. A. Hastings & Co., manufacturers' agents, have removed from 195 to 205 Lake street, Chicago.

K. Franklin Peterson, manufacturers' agent, has removed from 195 Lake street, Chicago, to 205 same street.

#### MADE FOR ALL DEALERS.

The Associated Merchants Journal and Dealer's Review of Reviews, Chicago, introduces something new to trade journalism. It is to the business world exactly what Albert Shaw's Review of Reviews is to the literary world—brisk, concise reviews of the best articles of brilliant writers in the leading trade publications. To the general merchant the journal presents the broadest field of observation in the business world. Recognized leaders in their special lines are in charge of the several departments, the directory being Charles S. Powell of Boston, president; W. G. Watkins, vice-president and treasurer; C. Franklin Davis, secretary of The Research Publishing Association, publishers; Porter D. Breed, editor and manager. The Research, Purchasing and Collection Departments especially interest subscribers, being a source of revenue and saving to all subscribers. Sample copy mailed upon application.

## MISCELLANEOUS.

Advertisements under this head 5 cents per word first insertion, 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders, or stamps received.

### WANTED.

## CUT ON LOW GRADE BICYCLES

### Buffalo Dealers Meet Department House Competition—Wary of Second Hand Machines.

Buffalo, March 13.—A systematic canvass of the cycle trade in Buffalo, which implies a personal visit to every dealer of prominence in the city, leads to the belief that the approaching season will be the greatest in the annals of the local trade. While the margins of profit will be less than last season, it is expected that the deficiency will be more than made up in volume of business.

#### Competition Will Be Sharp.

"Competition," said the head of a prominent firm, "is going to be the sharpest ever experienced by the Buffalo trade. I mean by this that there is a strong likelihood of prices on high grade goods being cut in some quarters. While I do not look for it before the season is well advanced it may come earlier, and when it does come it promises to be a bitter struggle with the odds in favor of the strictly legitimate dealers. Last year many agents dropped out of business through lack of patronage, but others have taken their place and all of the newcomers are out for business. Some of them will have difficulty in weathering the storm of competition and their early downfall is looked for."

#### Advance Sales Are Heavy.

The selling season practically opened the first of the month and the volume of business transacted during the intervening period up to date shows a surprisingly heavy increase over that done in the same period last year.

No general attempt at holding opening days has been made, but those who have had their "shows" report many actual sales to visitors and the booking of orders for delivery at the opening of the riding season. Exceptionally large crowds of sightseers were in constant attendance at these shows and much interest was manifested in the different models. The chainless came in for the greater share of attention. One of the large branch store managers reports having sold over fifty chainless machines since the first of the year, with orders coming in every day. There is a noticeable public desire for the better grades of machines.

#### Low Priced Goods Suffer.

The announcement of the big stores' sale of machines at \$18 and \$25 was the signal for the precipitation of a price war on the medium and lower priced goods which promises to gather energy as the season advances. These prices have been met by a score or more concerns, all of whom put forth the claim that their machines are of superior qualities. Several of these concerns are offering bicycles at prices for which a good set of tires could not be obtained and on terms to fit the buyer. The strictly legitimate

dealers are keeping as far away as possible from this species of warfare, and while everybody is plentifully supplied with stocks that can be sold at a profit and compete with these concerns, no attempt will be made to push sales of low priced goods unless circumstances compel such action.

#### Wary of Second Hand Goods.

The second-hand exchange business will not be carried on as extensively as in former years. Nearly all of the prominent dealers will refuse to take old machines in trade, and those that expect to do business on this line will not allow more than 25 per cent. of the original value of the old machine, providing it is not of too old a date. Others will take old models, place them on the salesroom floor, get what they can for them, and place the amount received to the credit of the customer. This plan is said to be a most satisfactory way out of a bad practice, and one which benefits the dealer and customer alike.

#### Retarded by Municipal Indifference.

St. Louis, March 13.—The large jobbers of bicycles and sundries in this city report that business out through this and the immediately adjoining states is good and that prospects were never better. It is a peculiar fact, however, that retail trade in this city is poor and has been so for a long time. This is generally believed to be due to the poorly paved streets, the indifference of the city officials to sprinkling methods and to the municipal tax on bicycles. Because of these things cycling has for some time been undergoing a retrograde movement here and a number of old bicycle firms have gone out of business. With a more liberal policy on the part of the town council toward cyclists and the inauguration of a movement toward improving the streets, a quick revival in things bicycular is expected.

#### Eager for Dunlop Stock.

The \$300,000 preferred stock of the new Dunlop Tire Co., Ltd., bearing 7 per cent interest, was subscribed ten times over by eager Canadian investors. Its subscriptions actually amounted to \$2,944,300.

## KENTUCKY DEALERS CHEERFUL

### Sales Begin With First Spring Weather—Irresponsible Dealers Out of the Field.

Louisville, Ky., March 13.—Three beautiful spring days last week had the effect here of enticing prospective purchasers to the bicycle stores. It looks very much as if spring trade has opened, as the dealers have all been unusually active for the past week and a number of sales have been made. All are in high glee because everything, they say, points to a highly successful season during 1899, much more so than for several years past.

There is also cause for jubilation in the fact that the number of dealers has been reduced to a minimum, the mushroom stands having been compelled to close their doors, leaving the well established dealers to take care of the trade. It should naturally follow that there will be no rate cutting and that installment sales will be reduced to a point where they can be taken care of without loss of money.

#### Strong Demand for 30-Inchers.

All of the local dealers are well stocked up with new goods, and are ready to fill orders. The 30-inch wheel will play an important part in the sales in this city from the present outlook. One dealer sold six bicycles to six different parties, all of whom selected machines with 30-inch wheels and 26-inch frames.

The usual spring talk of the establishment of a board of trade is being indulged in, but under present conditions there is no need of such a thing. The trade is now in the hands of old reliable dealers while the repair men, though they have not adopted a schedule of prices, yet seem to understand each other, and it is likely that they will continue as they have done heretofore. Just at present the repair shops are full of work, and no doubt they will enjoy a fine season.

A reputable dealer states that there are too many second hand bicycles on hand. A good, serviceable machine can be purchased for \$5, and if a purchaser gets \$15 in a trade for a new machine he will be doing well.

#### Charges on Country Checks.

New York merchants will very soon be compelled to pay a charge of at least 10 cents for every check or draft their bank collects for them, with the exception of items collected in the cities of Boston, Providence, Albany, Troy, Jersey City, Newark, Philadelphia and Baltimore. On items collected in these cities the banks will still have the privilege of making free collections if they so desire. The ten cents charged is the minimum, and the regular charge will be not less than one-tenth of one percent for items collected in nearby states and one-quarter of one percent for items payable in the more remote states. Any bank convicted of making

free collections after the rules have been regularly promulgated will be fined \$5,000 for the first offense, and in case of a second violation any collecting bank may also be expelled from the Clearing House Association. The plan prepared is modeled very largely after the plan of the St. Louis banks, with such modifications as are necessary to meet the demands of New York city.

**LOOKING FOR \$50 MODELS**

**Binghamton Buyers Do Not Take Kindly to Cheap Machines—Dealers Well Supported.**

Binghamton, N. Y., March 12.—More people hereabouts are looking for bicycles at \$50 than at lower prices. This has never been a good market for cheap machines, the demand having always been confined to high and medium grade models.

That the general local commercial conditions have improved there is no question. The factories are running on full time. Signs are frequently displayed in the factory windows calling for more help. The suburb of Lestershire, just west of the city, is booming in true western style. It now boasts the largest shoe factory in the world, and additions are to be made this spring to the extent of \$150,000 to provide space for the employment of several hundred more operatives. These workmen are excellent bicycle customers, buying close, but demanding a good article. There is no doubt that the purchasing capacity of the public has increased within six months and is vastly better than it was a year ago. It will be a month before the highways are fit to ride, and meanwhile buyers are slow.

The cycle trade of the city is all in the hands of legitimate dealers. The department store problem has not required any discussion here. One dry goods establishment last season secured some machines on which they attempted to cut prices and make trade. Within thirty days after the goods arrived the factory had gone the way of all earth, and the venture fell through. Another concern had a very unsatisfactory experience with some machines without name plates which were sold at a ridiculously low price.

**Union Workers Circularizing the Trade.**

At the last regular meeting of the Toledo Union Label League it was decided to advance the interests of the Bicycle Workers' Union just now when the selling season is opening. With this object the secretary of the International Bicycle Workers' Union is sending copies of the following circular to the trade:

**UNION WORKMEN.**

To the Friends of Organized Labor.  
Greeting:—The Toledo Union Label League desires to call your attention in purchasing a bicycle to the label of the Bicycle Workers' Union, and urge you to buy only wheels bearing said label, and for these reasons:  
The label stands for skill and competency versus penitentiary and child labor.

It means that every part has been handled by a skilled mechanic.  
It means that these workers are receiving a fair division of the wealth they create—the correct foundation of prosperity and happiness.

It means that their employers recognize the equality of bargaining power.

Ask your dealer to supply you with a labeled bicycle, thereby assisting the workers in their efforts to keep women and children out of the shop and factory; to bring about the shorter workday; to maintain a wage scale whereby they can educate their children as befits the coming generation.

Sincerely and fraternally,  
TOLEDO UNION LABEL LEAGUE.

Austrian cycle manufacturers are petitioning their government to increase the existing duty on bicycle parts.

Probably the oldest living cyclist is a woman in Essex, England, aged 93.

**NEW ORLEANS REPAIR PRICES**

**UPHELD BY COMMON CONSENT**

**No Fixed Schedule Adopted But General Adherence to One List Makes It Standard.**

New Orleans, March 14.—Bicycle dealers and repairmen in this city have no fixed schedule of prices for repairs, but by common consent the charges contained in the appended list are recognized as standard.

When it becomes necessary to detach a brazed sprocket and to put it back again, an additional charge is made over that contained in the list.

**Sundry Repairs Charged By Time.**

Repairs to saddles, bells, cyclometers, lamps and pedals are charged according to the time occupied and material used in repairing them and are therefore not listed. In many instances prices on new pedals and saddles are less than repairs to old ones. When tubing or stays are replaced, the prices contained in the list include the cost of material, but where connections, hanger brackets, seat post lugs and rear forks are replaced the prices quoted are for the labor of performing the work and do not include the material used.

**Special Charges for Old Machines.**

When new parts are brazed in frames or forks the nickeling and enamel are damaged, and prices quoted on such work do not include fresh nickel plating or enameling. The prices contained in the appended list are on modern bicycles. An extra charge is made for out-of-date machines or ones of special make that require extra labor or special spokes. Rim cut tires are not repaired.

Following is the schedule of prices:

**Repairs to Frames.**

Replacing top tube.....	\$ 2.50
Lower tube.....	2.50
Top and bottom tubes.....	4.00
One rear fork side.....	2.50
Two rear fork sides.....	4.00
Seat post mast.....	3.50
Head.....	2.50
Head frame connection.....	2.00
Seat post connection.....	3.00
Crank hanger bracket.....	5.00
One rear fork end.....	1.75
Two rear fork ends.....	2.75
Lining up frames.....	\$1.00 to 2.00

**Repairs to Front Forks.**

One new side.....	\$ 1.75
Two new sides.....	3.00
New stem.....	1.75
New arched crown.....	2.75
One new tip on fork end.....	1.25
Two new tips on fork ends.....	2.00
Complete forks to order, arched crown.....	5.00

**Enameling.**

When Machine is "Knocked Down."

Frame and forks (complete) re-enamelled in any dark color.....	\$ 3.00
Frame and forks (complete) re-enamelled in any light color.....	4.00
Frame and forks (complete) re-enamelled in white.....	6.00
Front forks re-enamelled.....	1.00
Front forks nickeled (crown and tips only).....	75
Striping frames, plain (extra).....	50
Striping and decorating frames (extra).....	1.00
Enameling rims, each.....	75
Enameling two rims.....	1.00

**Replacing Rims.**

One wood rim, common, 1 1/2 to 1 3/4 inch.....	\$ 1.50
One wood rim, extra quality.....	2.50
One wood rim, racing or tandem.....	2.75
One wood rim for G. & J. tires.....	3.00
One steel rim for M. & W. tires.....	4.50
One copper rim for G. & J. tires.....	4.50
Truing wheels, each.....	50c to 1.50

**Repairs to Chain and Mud Guards.**

New silk lacing on mud guard or chain guard.....	\$ 1.00
New silk lacing on both guards.....	1.50
New wood mud guard on ladies' bicycles.....	1.00
New wood chain guard on ladies' bicycles.....	1.00

**Sprockets.**

Making new rear sprocket, 7-8-9-10 teeth.....	\$1.25 to \$ 2.00
---	-------------------

**Repairs to Tires.**

Punctures, single tube tires, each.....	\$ 0.25
Punctures, double tube tires, each.....	50

Vulcanizing, small patches.....	50
Vulcanizing, large patches.....	75c to 1.25

**General Repairs.**

Front axles, each, about.....	\$ 0.25
Front wheel cones, each, from.....	50c to 1.00
Front wheel cups, from.....	50c to 1.25
Front or rear wheel nuts, each.....	10
Rear axles, each, about.....	35
Rear wheel cones, from.....	75c to 1.50
Rear wheel cups, from.....	75c to 1.50
Crank hanger cones, from.....	\$1.00 to 2.00
Crank hanger cups, from.....	1.00 to 2.00
Crank hanger axles, from.....	1.75 to 4.00

**Repairs to Chains.**

Putting one link in chain.....	\$ 0.25
--------------------------------	---------

**Prices for Nickel Plating Parts.**

Frame and forks.....	\$12.00
Handle bar.....	1.00
Large sprocket.....	75
Medium sprocket.....	50
Small sprocket.....	25
Fork crown and tips.....	75
Fork crown only.....	50
Spider crank.....	40
Pedal.....	50
Hub.....	40
Crank.....	25
Seat post.....	25
Small parts and fittings, each.....	10c to 25

**DEALERS PROMULGATE POLICIES**

**Massachusetts Agents Will Make No Free Repairs on Guaranteed Machines—Installment Policy.**

There will be no free repairs made on guaranteed machines by the bicycle dealers of Salem, Mass., and vicinity. No matter how trivial the accident to a guaranteed machine in this part of the country a rider will be compelled to ship it to the factory or pay the dealer for his trouble in making the repair.

The dealers have also agreed upon a governing policy in dealing with customers who purchase machines on the installment payment system. First payments will be as follows: \$30 on a \$75 machine, \$25 on a \$60 machine, \$20 on a \$50 or \$45 machine, \$15 on a \$35 or \$40 machine, and \$12 on a \$25 or \$30 machine.

In case of a lapse of payment of installments for two weeks the dealers have agreed to seize leased machines, and if the installment be not paid at the end of fifteen days the machines will be sold.

On repair work it has been decided to charge 25 cents per week storage on repaired articles unclaimed after 30 days. Articles unclaimed after 60 days will be sold for the charges.

**Fixing the Guarantee By Law.**

Consideration was recently given to the bill introduced into the Connecticut legislature which requires bicycle makers and agents to give a written or printed guarantee for two months. A representative of the Pope Mfg. Co. opposed this bill on the ground that it is class legislation. The author of the bill thought that it would have a good effect in requiring the makers of cheap machines to put better material into them. He referred particularly to machines which are made outside of the state of Connecticut and contended that the bill was for the protection of people who, through want of money or ignorance, bought cheap bicycles.

**To Keep Track of Deadbeats.**

At a recent meeting of the organized Boston cycle tradesmen it was decided to revive the system of notifying all members of undesirable credit customers. When the information bureau was in operation before the names of 157 delinquents were sent out to all the members. Over 100 stolen bicycles with full descriptions had also been reported to them. The collection department had also proved effective in many instances when members had been unable to get bills paid through the usual efforts. The secretary of the local board of trade has asked all members to begin sending in names of delinquent customers, and said that the annual dues had been reduced from \$12 to \$3 a year.

## BRAZING BY IMMERSION

### University of Wisconsin Frame Cleaning Process Seriously Affects Brass in Joints

The college professor is no longer limiting his relations with bicycle manufacturers to efficiency tests and opinions upon the mechanical merits of machines forwarded to him for examination and test, but is now taking an active hand in manufacture, his aim being to show the cycle maker how to remove spelter without filing and incidentally to add to his income by selling such information. C. F. Burgess, of the department of applied electro-chemistry and electro-metallurgy at the University of Wisconsin, offers to sell a frame cleaning process to any cycle manufacturer who is willing to rely upon his statement that it is all right. Below is a copy of a letter he recently sent to many prominent manufacturers:

#### Circular Letters Sent to Dealers.

A process has recently been perfected in our laboratories for the removal of superfluous spelter from iron and steel surfaces, whereby the expense of removal, as by grinding and filing, may be greatly reduced.

Our process is especially applicable where the brazing is done by the dipping process, which is coming into such extensive use of late.

Our process has been put into operation by a prominent bicycle manufacturer and has fulfilled expectations completely, not tacking the steel, but in leaving a fine surface for the enamel.

As manufacturers of bicycles, and therefore probably doing considerable brazing, you may be interested in effecting the saving made possible by this process, and if this is the case I shall be glad to hear from you regarding it.

I should also be pleased to receive a sample brazed joint, such as a seat post, which I will have cleaned by this process and returned for your inspection.

C. F. BURGESS.

University of Wisconsin.

#### Only an Acid Cleaning Bath.

The fact that the professor busies himself in an electro-chemical and electro-metallurgical laboratory lends color to the impression that his spelter removing process is strongly aided by electricity. The letter below, however, which was written to a maker who sent a sample dip brazed joint to Mr. Burgess for trial, in response to the first circular letter received, leads one to conclude that the process is nothing more than simple acid cleaning. The professor writes as follows:

Your letter and sample brazed joint have been received, and I am returning by mail this joint which has been subjected to our cleaning process for removing spelter. This will enable you to judge of the efficiency of the process. The results may be even better under more favorable conditions. The length of time which it takes to clean such a joint by our process in the manner shown is less than one hour. Where the coating of brass is even distributed the length of time necessary is from 15 to 30 minutes.

As you will see, the solution has had no bad effect whatever on the iron, nor would this have been the case had the joint been kept in the solution a much longer time. Consequently it is possible to remove every particle of brass from the surface by leaving it in the solution long enough, but this is hardly desirable, for some filing is necessary at any rate to smooth the joints, and the small amount of metal which is left is rendered so soft as to be removed readily.

The basis upon which we propose to dispose of this process is that the manufacturer using it contract to make a payment to us of two and one-half cents for every frame turned out by the factory, the contract to be made to cover one year from date of installation of the process. For this sum the chemicals necessary for removing the spelter will be supplied by us f. o. b. Madison, Wis. Further, the knowledge in regard to the process is to be carefully kept within the works where it is used. The cost of installing the permanent equipment necessary for the operation of this system is to be borne, of course, by the company mak-

ing use of it, but this is merely a nominal amount, depending largely upon local conditions. I will be enabled to make a fair estimate as to this amount upon learning what number of frames you desire to treat per day.

The cost for the operation of this process, aside from the chemicals, is a small amount, consisting almost entirely of labor account. Two attendants with proper conveniences could handle 100 frames per day.

From the above information, and from that derived from inspection of the sample joint, you may be able to calculate what saving this process would be to you, and if there is any further information which you desire, and which I feel that I can give, I shall be most happy to do so.

Trusting that this reply will meet with your approval, and that I may hear from you at an early date, I am,

C. F. BURGESS.

University of Wisconsin.

#### Prospecting for a Gold Mine.

The professor speaks of the spelter removing means as a solution, the chemicals for which he will sell ready compounded for 2½ cents per frame. He states that the cost of operation, outside

to be well grounded. In every branch of the seat cluster the adhesion between the brass and the steel has been ruined. The brass was not only eaten entirely out of the joints at some of the lug branches, but where brass was left the original alloy of copper and zinc was so affected that practically no union between the spelter and steel remained. In splitting open the joints the brass did not divide as it should, leaving a thin film on each part of the joint, but easily rolled free from either the lug or the tube.

#### Process Shows Nothing New.

Mr. Burgess' statement that the spelter was removed from the outside of the joint and that a good enameling surface was left, is true. With the pickling process others have accomplished the same result. There is nothing but the professor's statement to prove that the steel itself is uninjured. Viewing the subject in its entirety the experimenting of Mr. Burgess is unsatisfactory. Cycle makers will continue to use file and sand blast for the removal of spelter, at least until the latent virtues of anti-flux are more attentively regarded.

#### Rivalry at Cycle Shows.

During the Boston cycle show an exhibitor offered a lamp each evening for the prettiest girl to be found at the show. Judges were appointed, and, with the aid

SEAT CLUSTER SHOWING EFFECT OF BURGESS' CLEANING PROCESS.

of the original expense of the solution, consists almost entirely of labor. Extensive use of an electric current is thus barred. At any rate Mr. Burgess is either asking 2½ cents per frame for the privilege of using a blue vitriol solution in connection with an electric current in a manner similar to ordinary electric decomposition as employed in electroplating, or he is charging 2½ cents per frame for some common acid with which to fill a pickling bath.

#### Well Brazed Joint Entirely Ruined.

Removal of spelter by pickling is a process not held in favor by manufacturers, because of the fear excited that during the pickling the steel will be injured and the brass in the joint affected as well as that on the outside. The illustration accompanying this article shows a joint which has been cleaned by Mr. Burgess and which was afterward cut open to note the effect upon the brass in the joint. The suspicion that the joint would be affected by his process is proven

of a megaphone, all were summoned to draw near and witness the selection. After much elaboration of detail in picking the girl, the award was made. This performance so riled the soul of a rival exhibitor that he decided to give a lamp to the homeliest girl. His scheme gave him all the notoriety he coveted, but did not add much to his popularity. The visitors to the show were given plenty of opportunities to draw a prize or an award of some kind through the many schemes which the exhibitors worked for the purpose of gaining publicity. Tires, saddles, cyclometers, and, in short, almost every species of cycle sundry, were distributed in addition to pound packages of coffee, traveling bags, pairs of shoes, cameras, etc. Each person upon entering the exhibition building was given a blank card upon which to write his or her name. This card was dropped into a box at a certain booth, and later in the evening they were drawn out and the people claiming the lucky numbers were awarded prizes.

# Crescent Material

The *first essential* of a perfect bicycle is the *best material*. Enamel and nickel will cover inferior workmanship for a time only. *Safety and service* demand the *finest material of the highest test*. There is nothing better than the best, so there is no stancher wheel than the

COPYRIGHT 1888, BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

PRESENTING TESTIMONIALS.

F. A. COPELAND, President. J. B. BRIGG, Sec'y and Treas.  
LA CROSSE LUMBER CO.,  
Manufacturers of Lumber, Lath and Shingles.

LA CROSSE, WIS., Dec. 15th, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—I wish to let you know that all during the season of 1898 I used the Milwaukee Patent Puncture-Proof tire on my bicycle, and wish to testify with what a pleasure my bicycle was stored away for winter without once having had a dismount on account of failure of tires during the whole time since putting them on my wheel. I also found scarcely any difference of power required to propel the wheel for lack of ease in tread and resiliency common in all other attempts at what you have secured in furnishing a thorough puncture-proof tire. Yours very truly,  
(Signed) F. A. COPELAND.

CHAS. FITZ-GERALD, Architect.  
MILWAUKEE, WIS., Dec. 17, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—I used your Patent Puncture-Proof Tires on my wheel the last season, without having a puncture or any need of repairs, in the same service, in which I had the misfortune to average two punctures a week in the season of 1897, when I used the ordinary tires. Therefore, the Milwaukee Patent Puncture Proof Tire has given me very great satisfaction, and I take pleasure in recommending the same. Respectfully,  
(Signed) CHAS. FITZ-GERALD.

Representatives Wanted. Write for prices and other information.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.

Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## MAIL ORDER COMPETITION

When one kind of trouble ceases another kind usually begins. Bicycle dealers have had their trouble with department store competition in the large cities and with curbstome brokers in the smaller ones. In the natural course of events the department store has found its level. Manufacturers have discovered that they lost touch with the public if the qualities of their product were left to be extolled through the scant knowledge of department store clerks, and have reverted with renewed faith to the professional bicycle dealer who does something more for his patrons than the mere surrendering of an article of commerce. The principle that "when we have received your money we are done with you; next!" which is inherent in the nature of the large stores, has been proved fallacious for all trade in bicycles which are better than they look, and by tacit understanding department store owners have returned to their old policy of trading exclusively in bicycles which are worse than they look, or worse than their previous reputation would indicate.

The general acknowledgement of this among the public and the manufacturers has smoothed the road for the professional bicycle dealer. His professional and personal guarantee of the bicycle which he sells and his ability to allow credit to his customers are again at a premium.

The restriction of credits and the general improvement in manufacturers' business methods have removed the curbstome broker and reduced the number of competitors for retail trade.

With these facts in mind the cycle dealer has generally been preparing himself for doing a prosperous business this year and has observed with much satisfaction that the all-around reduction in selling prices did not necessarily imply a corresponding reduction of his percentage of profit. For those who succeeded in selling a goodly number of bicycles last fall to the lucky agriculturists who had disposed of their wheat at war prices, it seems more or less likely that the natural increase in the volume of this rural trade, in combination with the decrease in number of competitors, would operate to make the total gross trade as satisfactory as the percentage of profit, and altogether 1899 has been looked forward to as a promising season for those who would read the signs right and act accordingly.

The devil is always at work brewing trouble, however, and usually appears in an attractive guise. This time he is muddling the prospects for rural trade through the patent inside columns of weekly country newspapers. Alert mail order houses have discovered that a bluff is a capital thing with which to discountenance any pretense on the part of rural buyers at knowing a good bicycle from a bad one at sight, and now propose to disarm all suspicions that might prevent such customers from forwarding money before they have seen the goods by calmly offering to express bicycles to any destination on receipt of one dollar, balance of 'steen dollars and cents to be paid the express agent after examination of the machine. If made to people who would know much more about the bicycle after they had seen it than before, this proposition would be the ne plus ultra of fairness. As it is, it is bound to produce results, and bicycle dealers, with whose plans it may interfere, may be wiser in taking measures for protecting themselves against it than by disregarding it. The price is low, and the offer is made so early in the season as to forestall the efforts which bicycle dealers usually make later in the season for obtaining that country trade which depends upon the agricultural crops.

Forewarned is forearmed. Whether the mail order business turns out large or insignificant, the cycle dealer should know

that unusual inducements are being offered to make it a success. Advertisements noticed in a single day comprise twenty-eight country newspapers, chiefly in Iowa, Illinois and South Dakota, but also in Nebraska, Indiana, Wisconsin, Tennessee and Louisiana, all worded in the same terms, with a bottom note suggesting to the bicycle dealer that he may readily sell the machines offered at the rate of one per week with an 80 per cent. profit added. No bicycle dealer will, of course, be so fatuous as to ruin his business by attempting to sell for \$30 what any reader of newspapers in his territory may obtain for less than \$20. The advertisers themselves probably have no such expectations, but are satisfied if the note will instill the poisonous idea in the reader's mind that bicycle dealers are in the habit of doing such things.

The measures of defense which the policy of the mail order house really suggests for bicycle dealers must be on a different line, and must take the form of retaliation and enterprise. Cheap bicycles are openly in the market, and samples of them may be secured by any dealer. To counteract the effect of the mail order advertisements the dealer must advertise his cheapest machines with complete description, as well as the better grades, and offer inducements to his rural customers in the way of terms that will tempt them to secure possession at once, or, still better, pay down part of the purchase money in advance.

## GOOD RACING PROSPECTS

Dealers in bicycles can as a rule not afford to dip deeply into the game of cycle racing. With their natural instinct for the sport still alive, though latent and subdued through the exactions of business, attention to racing is likely to get the upper hand with most cycle traders to the prejudice of business interests, if indulged in the whole-souled manner of bygone days.

Still there is a certain degree of familiarity with racing events which customers expect of the dealer, and there is a stimulus to trade in racing, which may easily be purchased too dearly, but which, if the popular interest in it is genuine and spontaneous, is not to be despised. For the coming season indications point to a revival of racing in the form which should not rest heavily on the trade, because it is likely to proceed from the public without much prompting or subsidizing.

The L. A. W. and the N. C. A. are both in the field, and, while it is difficult to say at the present moment whether the latter organization will succeed in enlisting popular support, it seems a reasonable surmise that it will at least stimulate the larger and older body to more active work. Competition in racing matters should prove a healthier factor than in trade.

Mechanical pacing and the rivalry between bevel-gear, roller-gear and chain bicycles also combine to add features of novelty and interest to racing which have been lacking of late, and it can hardly fail that the powers which make the mare go will also exert their influence in a quiet way to prove which of the three constructions should carry the laurel wreath for speed.

A little time spent by bicycle dealers to keep abreast of the situation may prove a profitable investment.

\* \* \* \*

It is the general impression that all the markets of South America are rising in value for our makers. Such, however, is not the case. In Central America and Honduras there has been a decline in the year from \$21,000 to \$7,000. Mexico shows a falling off of 20 per cent. The West Indies make a bad showing, leaving us, in point of money volume in exports, where we were three years ago. Argentina, on the other hand, is ranked as one of the best of South American markets, and its volume of business with this country in the past year has been two and one-half times as great as in the previous year. Considering the heavy shipments into Argentina, it is strange that the demand for American parts, materials and sundries is so light. Brazil almost doubled its purchases last year, principally for bicycles. The remainder of the South American markets show a decrease of 11 per cent.

## AUSTRALIAN TRADE AND PRICES

### Heavy Duties and English Fittings Bring List Prices Up —Outlook for American Machines

The following letters from Australia are self-explanatory and are given in full as reflecting accurately the state of the cycle trade of the antipodes:

To the Editor.—Noting in the December 15 issue of your paper, the prices of bicycles in Australia, as supplied by your Sydney correspondent, we desire to state that as this report is, in a measure, confusing to American and Canadian dealers wishing to push their goods on this market; we herewith enclose a corrected report of trade conditions in this country which you can rely on for accuracy, as the writer thoroughly understands the cycle trade of this country.

BRANTFORD BICYCLE SUPPLY Co.  
Sydney, N. S. W., Feb. 13.

#### Large Capital Required.

Australasia is divided into several colonies, and in each colony the duty varies from 10 and 10 per cent. to 25 and 10 per cent. on the ordinary market value of the goods at the port from whence they were last exported. In this way a factory opening a branch in Sydney, N. S. W., must pay duty when distributing its goods on the Sydney selling value of the machines, or else must open factory branches in the seven colonies, which is a very expensive undertaking considering that some of the colonies have not the population of one good-sized American city.

In conducting Australian trade a large capital must be invested. The two most successful firms have been the Goold Bicycle Company of Brantford, Canada, and the Massey-Harris Company of Toronto, Canada. It is claimed that each of these firms has been compelled to invest at least \$250,000 in opening their Australian branches.

#### The Range of Prices.

The first lists its machines in Australia at about the same price as in Canada. The \$75 model sells in Australia at \$82, and their \$100 model at \$105.

The second company lists its \$75 Canadian model at \$125, but this list price is not the cash price. This firm consigns machines at its own expense to country agents, which must necessarily raise the retail selling price.

The Austral Cycle Agency, another large Australian cycle house, is an offshoot of the John Griffiths Corporation of London. All agencies controlled by this firm in Australia are arranged in London by the head office, therefore, should it contemplate taking up the sale of American machines, contracts would have to be placed in that city. Balance sheets of the Griffiths Corporation, it is alleged, show a loss to date on the Australian trade of almost half a million dollars.

#### Consignment System Hurts Business.

Most of the leading American machines are represented in this market, but the consignment system adopted has retarded rapid progress.

Most of the English and American manufacturers have had traveling representatives cover Australia, and in their anxiety to get trade they accepted orders "cash against bill of lading." When the goods arrived they were in many instances left in the hands of the bank to be realized on. This flooded the market with English and American bicycles at any price, and in consequence has damaged the Australian trade. It is a well known fact that fully 5,000 bicycles were returned to English factories from cus-

tomers who could not or would not accept delivery.

American makers who wish to open up trade in this country must supply bicycles which conform to Australian ideas. A bicycle for this market must be a substantial machine with strong cranks (square preferred), detachable tires of the very heaviest variety, and easy spring saddles. All roadster machines must be fitted with brake and guards.

Neglect of Australian conditions on the part of American manufacturers when shipping bicycles to this country has done much to prejudice Australia against the American machines.

The universal tire on this market is an English detachable, but the Australian model is very much heavier than the American and is fitted to steel rims. The tire for Australia must have a heavy rubber surface and the strongest kind of fabric.

If American manufacturers are careful in following out Australian ideas, American and Canadian bicycles will eventually secure all the Australian trade, as the English makers are, as a rule, very much behind the times in all improvements.

### PERSISTENT ENGLISH LIES

#### American Bicycles Do Not Figure in Australian Auctions—Shoe on the Other Foot.

To the Editor.—The English Cyclist of December 14 says: "The last Australian mail brings news that large numbers of American cycles are still being put up for sale by auction." This is characteristic of the lies about American bicycles persistently circulated by the Cyclist, for not only are the Yankee manufacturers holding their own with the English, but in some sections they are beating them.

The firm that is doing more auction business than any other is the Austral Cycle Agency—a pup of the John Griffiths Company of England. It deals exclusively in English machines, and has put more bicycles on the market by auction this last six months than any other dozen firms.

Of course unfortunately there have been a number of American wheels sacrificed at auction; but I write in the interest of fair play.

I see a contributor has been writing to you about the prices American wheels fetch here, but you must remember that in most cases these prices are for the machines fitted with Colonial Dunlop tires and Westwood steel rims and English Brooks saddles. This adds a considerable sum to the landed cost.

Your contributor forgot to mention the Tribune. This is sold here by a Sydney firm for £21, with the firm's own nameplate on.

In conclusion, allow me to congratulate you on the get-up and general excellence of your paper. It stands apart from all other cycle trade papers, inasmuch as its contents repay perusal and the advertising pages are works of art from a printer's point of view.

AN AUSTRALIAN READER.  
Goulburn, N. S. Wales, Feb. 11.

#### Misleading Statement Corrected.

To the Editor.—We notice in recent issue of your paper that your Sydney cor-

respondent states that our bicycle is a \$35 machine and our agency was offered to the Austral Cycle Agency in this city.

We trust you will contradict the report, as articles of this kind circulated here would do us injury, and at the same time it gives the American manufacturer a wrong impression of Australian conditions as they are.

Our bicycles sell in Australia at the same price as in Canada. Our \$75 model lists in Australia at £16 10s. and our \$100 model lists at £21.

GOULD BICYCLE Co.  
Sydney, N. S. W., Feb. 13.

#### Why Exports to Australia Decreased.

The returns for American machines imported into Australia have greatly fallen off during the last few months, the imports for one month towards the end of 1898 being \$20,000, as against \$75,000 for the corresponding month of 1897. This decrease is principally traceable to the fact that the Australian market was used as an American dumping ground for cheap-grade machines, with the result that the Australian cycling community has had such a lesson that it will be a long time before the best American machines will be able to recover the ground lost through the short-sighted policy adopted by many American manufacturers when introducing their cycles into this country.—Australian Cyclist.

### EXPORTS FOR JANUARY

Almost \$200,000 Less Than in January of 1898—  
Shipments for Week Ending March 7.

Exports of cycles and cycle materials from the United States for the month of January, 1899, contrasted with those for the same period of last year, are reported as follows:

	1898.	1899.
United Kingdom .....	\$181,505	\$ 58,409
France .....	47,360	76,253
Germany .....	226,593	97,285
Other Europe .....	99,544	65,857
British America .....	24,244	69,517
Central America .....	945	275
Mexico .....	5,017	3,355
Santo Domingo .....	15	96
Cuba .....	763	425
Porto Rico .....	157	190
Other West Indies.....	6,268	4,596
Argentina .....	8,290	28,584
Brazil .....	10,973	2,538
Colombia .....	1,021	152
Other America .....	8,021	5,402
China .....	1,869	581
British East Indies.....	6,307	23,357
Hong-Kong .....	165	144
Japan .....	5,433	1,738
Australia .....	21,691	14,957
Other Asia .....	5,464	7,545
Africa .....	12,472	13,292
Totals .....	\$674,117	\$474,728

Exports of cycles and materials from the port of New York for the week ending March 7 are recorded as follows:

	Bicycles.	Mtls.
Denmark .....	\$ 47,012	\$ 9,607
Germany .....	21,837	6,738
Sweden .....	20,032	824
Africa .....	7,871	375
England .....	5,132	2,268
Russia .....	6,940	543
Holland .....	5,900	.....
Italy .....	2,770	2,547

Central and other South America .....	195	.....
Totals .....	\$125,037	\$23,604

#### Asked Police to Fix Rentals,

The bicycle livery keepers of Toronto, Can., appeared before the police commissioners recently and asked that a tariff

for the rental of wheels be fixed. They wanted a charge of 15 cents for the first hour, 10 cents for the second hour, and 5 cents for each additional hour. The matter was not settled.

**SEPARABLE REAR HUB**

**Allows Removal of Wheel Without Disturbing Chain—For Use With Gear Cases.**

In England where gear cases are in constant use the removal of the rear wheel to mend a tire puncture or accomplish any other repair is a matter of no little bother unless means are provided for slipping the rear hub out of the fork ends without disturbing the chain and its cover. To accomplish this end W. H. Chapman of London, has invented and patented a hub, the barrel of which is in two parts, allowing the removal of the main part without detaching the sprocket wheel and the right end bearings from the frame. On the sprocket side the ball cup carriers form an extension of the hub shell to which it is screwed by means of a collar which screws on to the outside of the shell, engaging a vertical flange on the cup while a horizontal annular flange of the cup fits into the hub shell interiorly.

The cone on the sprocket side is supported rigidly in the rear end lug of the frame by a nut screwing on to its outer threaded end. The spindle has a rigid head on its right end and is shouldered to fit against the end of the right cone through which it passes. Matching threads on the axle and on the inner end of the cone join the two to support the cone under the pres-

sure of the bearing when in use. The left axle cone slips into the spindle and abuts against a shoulder. A threaded collar on its outer end keeps the cone from falling entirely out of place when the axle is withdrawn from the hub.

To separate the hub and remove the wheel from the frame the collar between the sprocket and the right spoke flange is loosened, the left axle nut removed and the axle withdrawn from the hub. The wheel is then slipped far enough to the left to free the hub barrel from the right ball cup and is removed from the frame. The right end bearing parts will remain in the frame and the left ones will be detached with the hub. After the wheel has been replaced and the left axle nut tightened the adjustment of the bearings will be the same as before. The most serious disadvantage of the hub seems to be that a considerable amount of space is lost between the sprocket and the right spoke flange, and that the ball cup on the sprocket side is subjected to a breaking strain which does not go well with the accurate circularity required of bearing parts nor with the nature of tempered tool steel.

**Three Mechanical Joints.**

United States patents have been allowed Henry Belcher and Frederick Easom of Beeston, England, on three forms of mechanical or brazeless joints. In the first the connecting lug is split and drawn tightly down around the frame tube by a screw draw bolt held from revolving by a small pin and notch engage-

ment similar to that formerly employed in cross compression bolts at split seat clusters. A short cross tube surrounding the draw bolt reinforces the frame tube.

In the second form of joint the wall of the lug is left solid and the end of the entering frame tube is split. A split cross tube coinciding with the side holes in the tube and lug is fastened inside of the frame tube. Through this tube a taper drawbolt is drawn by tightening down its nut and the cross tube is thus expanded. The expansion of the cross tube expands

the split end of the frame tube so that the latter is bound tightly within the connecting lug.

The third joint also employs a split tube end but the expansion is obtained by two set screws entering through holes diametrically opposite to each other in the lug. The screws, each, enter a threaded hole in an integral extension from the inner wall of a split reinforcement inside the frame tube. Turning the set screws draws the sides of the reinforcement or liner outwardly against the frame tube and expands it till it binds against the inner wall of the lug.

**SIMPLE ONE-SIDE PEDAL**

**Plates Formed in One Piece—Parts Held Together By Expansion of Pedal Barrel.**

The popularity of low crank hangers has brought out the fact that one-sided pedals are desirable for gaining clearance between the pedal and the ground. Emil Klahn of West Hoboken, N. J., invented and patented a pedal of this character which is shown in the accompanying illustration. The spindle and bearings are contained in a sleeve of straight tubing. The cups abut against the ends of the sleeve and are retained in position by rings which slip on over the ends of the sleeve.

The foot plates are made together in one piece, being up-curved projections from the sides of the semi-circular shell

which fits around the under half of the pedal barrel. The end rings have two diameters, each being made with a curve on their lower half sufficiently larger than that on the upper half to accommodate the foot plate shell between it and the pedal barrel. They are also each split longitudinally at two joints diametrically opposite to each other to allow passage over the foot plate shell. The inner barrel or sleeve is longitudinally split along

its under side where the opening will be covered by the semi-circular shell and is made slightly larger than the inside diameters of the shell and end rings. The parts are to be so proportioned that the pedal will remain normally with the tread uppermost. If, however, this cannot be successfully accomplished a curved tongue might be formed integral with the rear foot plate, bent downward into such a position that it would aid the foot in picking up the pedal.

**NON-DISTORTING VULCANIZER**

**Tire Inclosed in Mold—Form Sometimes Improved During Vulcanization.**

F. R. Chamberlain of Newton, Mass., is the inventor and patentee of the vulcanizer shown in the accompanying illustration. The special objects aimed at in its construction are to avoid distortion of the tire to which a patch is being vulcanized and to render the vulcanization of fresh rubber patches on an old tire as sure as the vulcanization of a newly made tire. The appliance consists mainly of two metal rings matching one another and each having a semi-circular groove around its face, the two grooves when joined forming a complete circular mold for the entire tire. The lower ring is fastened rigidly to the bed of the machine

while the upper is vertically adjustable so that it may be raised sufficiently to slip the tire in place between the two. Each ring is also provided with an interior annular chamber which contains the steam or hot air used for vulcanizing. These heat chambers are divided into eight independent sections each of which is provided with a steam intake pipe and also a discharge cock.

After the tire has been patched it is placed between the molds and inflated to the proper degree. Steam is then turned into the section covering the location of the patch. As each ring has independent steam pipes the heat may be limited to one side of the mold if the patch is on the side of the tire. If it is on the tread or extends all around the tire the heat is turned into both moulds at the place where the patch was made.

This vulcanizer maintains and often improves the shape of the tire being mended but is comparatively expensive to manufacture, and takes but one size tire. It also occupies considerable space. It therefore seems to be intended for manufacturers more than for repairmen.

Its general design would point to especial usefulness of the machine for repairing rim chafed tires.

The patent is assigned to the Newton Rubber Works.

## SOLDERED FRAME JOINTS

### Factor of Safety Sufficient for Practical Purposes — Sand Blasting and Filing Obviated

To the Editor.—At this time, when manufacturers are displaying much interest in frame construction and joint forming methods, both from a standpoint of economy and structural excellence, the writer would like to call attention to a few of the advantages of a frame joining plan which, while it may not be new, has never as yet been credited with sufficient merit to cause more than trivial experiment. The scheme is nothing more or less than that of soldering together frame connections instead of brazing them as is commonly practiced, and while at first thought existing prejudice may make the proposition sound foolish, careful consideration ought to convince that soldering properly executed has many points in its favor.

#### Great Tensile Strength Not Needed.

The first objection raised each time soldered joints are mentioned is that there is not enough strength in the solder. Resting upon this assumption cycle mechanics have declined to give soldering further thought. Of course it would be ridiculous to say that soft solder was just as strong as brass spelter, but that is not the important question in relation to its use in bicycle joints. The question is this: Is it strong enough for the purpose? And if so, what are its advantages over spelter? In all of the approved forms of frame joints great tensile strength is not required of the soldering metal. The frame tubes run either inside or outside of the connecting lug, and in high-class construction fit snugly. Were butt end flush joints in use now solder would be out of the question, but as they are not, at least to any great extent, it is sufficient to say that any solder which is strong enough to keep the tubes from slipping from the lugs or loosening under torsional strains and under constant vibration is strong enough for practical purposes. Brass brazed joints have loosened; not, however, because the tensile strength of the spelter was too low, but because there was practically no brass in the joint.

#### Actual Tests of Soldered Joints.

It is known to the writer that in 1893 a Chicago rider while out in the country several miles from home made a solder repair which demonstrated that soft solder is not so weak that its only usefulness is inside tin shops and tinkers' work rooms. The seat post on the bicycle was of the pattern shown in Fig. 1, the horizontal arm being a solid rod about one-half inch in diameter and being bent downward at its forward end and brazed inside of the hollow seat post stem. The brazing never having been well executed and failing suddenly, the rider was compelled to repair it in some manner in order to get home. He accordingly stopped at an electric light station and borrowed the electrician's soldering outfit, which was of the common portable kind, and soldered the arm of the post into the stem. Several days afterwards, from mere curiosity, an experiment was made to test the holding strength of the solder. The stem B of the post was clamped in a vise and with a heavy hammer the arm A was pounded, the intention being to loosen the soldered joint. The solder failed to give readily, however, and the arm was bent downward to the position C, indicated in dotted lines, without the solder having apparently been affected.

In 1897 a cycle mechanic soldered together, by way of experiment, the upper and lower frame tubes and the steering head of a bicycle frame. The joints were then tested to destruction and the factor of safety of the soldered joints was found to be greater than that of the tubing. As a result of this test a western cycle manufacturer was induced to build two completely soldered frames, one for his own experimenting and the other for the mechanic who had made the test. The former machine when completed was placed in the hands of a man who was engaged in trimming street electric arc lamps in a suburban town where the roads were in none too good condition. The electrician weighed nearly 200 pounds and always started on his rounds with 50 pounds of fresh carbons in a leather case hung from the handle bars of his bicycle. After the machine had been in use for a couple of weeks the joint between the seat mast and the crank bracket loosened, it not

having been well soldered in the first place. This was remedied without spoiling the enamel and the machine carried its rider through the season without further misfortune. In fact, for all that is known to the contrary, the bicycle is still in use.

The other machine built at the same time was in use every day during the summer of '97 and caused not the slightest trouble. It was stolen late in the fall and nothing was learned of its whereabouts till the summer of 1898, when a bicycle answering its description was reported to have been brought to a certain repair shop to have the frame cut down from 24 inches to 22 inches. The repairer stated that when he put the frame in the brazing flame to unbrazed some of the joints the entire frame fell to pieces. Having a natural horror for solder he immediately refused to complete the frame cutting job, claiming the bicycle to be a cheap bargain counter machine.

#### No More Injured Tubing.

These instances of soldering actually accomplished and given road tests show that regular frame fittings intended to be brazed may be soldered together in what is perhaps a crude fashion and still possess enough strength to give hard service. The assumption may then be made that were frame parts properly designed for being soldered together and then soldered by approved means which would insure perfect union of the con-

nections, the result would not only be satisfactory, but perhaps a heavy blow to the scoffers at solder.

If it be true that the factor of safety of a soldered joint is equal to or greater than that of the frame tubes of the bicycle, then the factor of safety of an entire frame as a unit ought to be more than that of a brazed frame. While the brazed joint may possess a much greater initial strength than the soldered one, it must not be overlooked that in order to accomplish the brazing the life of the tubing in the frame has been more or less injured, according to the caution and skill displayed in brazing. When a frame is soldered the heat to which the metal parts are subjected hardly exceeds 400 degrees Fahrenheit and cannot possibly injure the steel. So if the strength of the soldered joint is equal to the strength of the tubing, and the vitality of the tubing is greater after having been through the soldering process than when having been brazed to the lugs, the general life of the frame must surely be greater.

#### Frame Finishing Eliminated.

There is one other item in favor of the soldered frame which amounts to no small matter in these days of reduced profits and low manufacturing costs. It is that by soldering frames together much if not all of the work expended in finishing frames after brazing and before enameling is made unnecessary. After soldering there is no sand blasting, no pickling and but little filing. The soldering, if properly accomplished, can be executed at a less cost than brazing and twenty to fifty cents in finishing saved on each frame.

#### Practical Methods of Soldering.

Fig. 2 illustrates a preferred form of construction for soldered joints. The connecting lugs should be bored tapering and the ends of the frame tubes taper swaged to match. Then the inside of the lugs and the ends of the tubing should be given a light pickle treatment in dilute hydrochloric acid in order to clean them for the reception of the solder. The pickle need not be strong enough, nor the duration of its action long enough, to injure the tubing. After cleaning the lugs and the tube are thinly tinned with a solder composed of about equal parts of tin and lead, though the proportion may advantageously be 55 per cent. tin and 45 per cent. lead. The frame tubes and lugs are next assembled and forced together lightly, the joints being heated sufficiently to melt the solder while under pressure. A sure joint is thus insured and there is no solder at any point on the frame, inside or out, except where it is wanted and where it will render service.

A hand gas torch furnishes heat enough to melt the solder and all of the joints in a frame may by it be heated while the frame is in a suitable jig. Good machining of the lugs and accurate swaging of the tubing are the only primary requirements to satisfactory results.

#### Systematic Practice in Large Shops.

In a large factory, where a multiplicity of jigs can be had, an oven might be rigged up in which a traveling crane would carry jigged frames in at one end and out at the other in regular succession, each frame having been heated in its travel through the oven sufficiently to cause the melting of the solder in the joints. The connecting lugs can be left with a definite wall thickness at the ends of the branches and an ordinary outside joint obtained or the wall can be finished to a feather edge and a flush joint effect secured. As the melting point of the solder is in the neighborhood of 400 degrees, all enamels baking at temperatures lower than this may be safely applied to the soldered frames.

FRAME BUILDER.

TRADE MARK

The following wood rim manufacturers are the only ones who are authorized to manufacture

# Dunlop Rims

and their makes of wood rims are the only ones on which our tire is guaranteed. Other wood rim manufacturers claiming to have our measuring bands and templates are guilty of willful misrepresentation.

## The American Dunlop Tire Company

Belleville, N. J.

Chicago, Ill.

Fairbanks-Boston Rim Co., Bradford, Pa., and Bedford, Mass.

Kundtz Bending Co., Cleveland, O.

Olds Wagon Works, Ft. Wayne, Ind.

State of Maine Wood Rim Co., West Paris, Me.

TRADE MARK

# THE STERLING

## "BUILT LIKE A WATCH"

THAT THAT IS IS THAT THAT IS NOT IS NOT.

Properly punctuated, this emphasizes the well known fact that a bicycle that is STRICTLY HIGH GRADE and of established reputation, represents money well invested; while the one that is not up to standard is simply an expensive object lesson.

STERLINGS are highest grade because they are made so.

BIG DISCOUNTS DO NOT INDICATE FIRST QUALITY.

STERLING net prices may not be as glittering as some others, but they are right, and the difference goes into the construction.

Do you wish quotations and descriptive catalog?

## MARVELS IN LITERATURE

### Two Samples of Daily Newspaper Work Intended to Help the Bicycle Trade

No sooner are the rigors of winter at an end than up bobs the scribbler for the country paper with his hardy annual essay on bicycle fashions. The scribbler may be, and usually is, about as wise as a frog concerning his subject, but his enthusiasm glows so fresh and strong that his intellectual blight is not resented by the trade he aims to serve. He is no trimmer, however; he never hedges in opinion; he is Sir Oracle. Out in Clinton, Ia., this is his favorite vein:

#### Talking Through His Hat.

The improvements on wheels this year are extensive. The 30-inch wheels are the talking points of many bicycle dealers and they are, without doubt, better than the old standard 28-inch wheels, for the reason that a large wheel will run more easily and longer after it is started than a smaller one, and this explains why there are so many of them being sold by manufacturers all over the country. Some say the big wheel can not be kept true. It can if it is looked after occasionally.

The hub recognized to be the most perfect for 30-inch wheels is on the \_\_\_\_\_ bicycle. The ferrule on this hub extends one inch above the hub proper. Twenty-eight inch spokes are used instead of the 30-inch, which does away with all possibility of the rims becoming twisted.

The frames used on these large wheels have an inch more drop.

#### Some "Late Improvements."

There are no center pins to work loose, which makes the wheel sound like a locomotive going up grade, and it gives the bicycle a finer appearance than the old time three piece crank. The two piece crank is a late improvement, but it is not so popular as the one piece and is used mostly on the cheaper grade of wheels, which are being sold at \$20 and \$30.

The expanders in the handle bar and saddle post are not as important as the other many improvements, but they do away with the clumsy bolts and clamps, which were so numerous in the wheels of two years past, but not so with the one piece crank, which is the admiration of every rider who has one on his wheel.

#### A Precocious Scribbler.

To the author of the following effusion, however, one is inclined to be less tolerant, for he hails from Rochester, a cycle manufacturing city, and, in addition to perverting public sense with respect to bicycle building, betrays an ignorance which is out of keeping with his opportunities for gaining true knowledge:

A reporter of the Post Express was shown through the factory of one of the large cycle manufacturing companies yesterday, where the bicycle in various stages of incompleteness is in the hands of the workmen. The tour of the factory began on the top floor. One of the first things necessary in the building of a bicycle is the tubing and the wheel spokes, and before these begin their career in bicycledom, they are put through a nickel plating process.

#### Tubing in the Nickeling Vats.

Electricity plays a large part in this process, the wires and tubing being hung in the chemical vats, which are so charged with electricity as to cover the surface of the wire with a coating of polished metal.

Another fundamental in cycle making is the brazing, the process which furnishes the greatest strength to the most important part of the machine. This is one of the really important things in the making of a wheel, and careless workmanship would render the entire wheel frame worthless. It is here that the metal is tested and the brass finishings melted and moulded into shape. Terrific heat is required for this. Another interesting department is that of the enameling, which is all handwork. The furnaces required for the baking, necessary to give the desired finish, are kept at a temperature of 600 degrees.

#### The "Wheel Turning" Machine.

One ponderous appearing machine is known as the wheel turning machine, and it is in that the hub and spokes are made perfect before the wheel goes to the assembly

room to become part of a bicycle. The machine puts equal tension on each spoke, and gives perfect balance. The biggest machine in the shop and the most formidable in appearance is one which chews up heavy steel tubing and turns it into hubs. Another machine which, by reason of its deeds, endears itself to every rider, is the vulcanizer, which applies a piece of rubber on a tire, in such a way that the tire forgets it was ever punctured.

#### Conclusions of a Rabbit.

In the assembly room is gathered from the various departments everything necessary to the building of a wheel. There are at least a half hundred different kinds of bolts and nuts, and washers and countless screws, and the absence of one of these is fatal to the wheel.

The generally accepted theory of laymen, that each wheel is tested before shipment, is not demonstrated at the cycle works. Each separate piece of machinery in the wheel is tested and the wheels are as they should be, when the various parts of it are put together. The manager said he doubted very much if any large factory tested each wheel before sending it out.

The moral of both of the foregoing articles is this: Agents and makers should be at pains to educate the reporters for the daily press, else the money they spend in advertising will merely be used to destroy the intelligent effort that is being put forth to enlighten the public concerning cycle construction.

#### Frame Stamped from Sheet Steel.

A United States patent has been granted to John MacKenzie of Middlesborough, England, on his stamped bicycle frame

previously patented in Europe. The frame is made from two steel metal stampings, each representing a one-half section of the finished tubular construction. The sections join tightly together at the seat mast, upper frame rail and steering head and are here fastened either by riveting, clinching or brazing. Along the lower reach the two sections do not engage each other but are spread to receive the crank bracket between them. The rear portions are also left a short distance apart to form the rear stays and forks. The lower frame reach and the rear forks and stays are thus semicircular in cross section.

#### Make Your Customers Comfortable.

Very few bicycle salesmen realize the importance of having a customer comfortable and at ease when attempting to make a sale, says the house organ of H. A. Lozier & Co. Have a comfortable seat for your prospective purchaser and do not enter into a long explanation as to the merits of your bicycle while he is standing. He will soon become tired and his attention will wander in spite of your most persuasive eloquence. If he is comfortably seated he is likely to give you his careful, undivided attention and will not feel impatient for you to finish your

talk. Neither can you expect to hold your customer's attention to the machine you are trying to sell him if he is surrounded by a number of other models of various kinds. Endeavor to have some corner or portion of your store free from bicycles or distracting mechanical devices, and when you have your customer comfortable in mind and body, bring before him the machine you wish to sell him. If he prefers some other model take it away and bring to him the model he desires to see, but do not allow his mind and eye to ramble over a number of different machines at the same time. If you allow a prospective purchaser to ramble along a row of bicycles in an aimless sort of a way without finally centering his attention on one particular model, he is liable to leave your store in a state of indecision fatal to your sale.

## PATENT OFFICE BUSINESS

Applications Received and Allowed—Recommendations for Facilitating the Work.

The United Patent Office received 33,915 applications for patents, 1,843 for designs and 84 for reissues during 1898. Of these 22,207 were allowed, including designs. The receipts of the office over expenditures were \$1,538.28. The balance to the credit of the office in the government treasury is \$4,972,976.34.

The commissioner asks for additional room, for an increased force in the classification division, and for more stenographers and typewriters. The annual appropriation for the scientific library has for years been inadequate.

The following amendments to the patent and trade-mark laws are recommended:

1. Providing for a commissioner and assistant commissioner for a stated term, not less than six years. There have been since 1870 fourteen commissioners.
2. To limit the life of all patents to twenty years from the filing of the application. At present it is possible to keep applications alive for an indefinite number of years.
3. Permitting aliens to file caveats. This is recommended for the sake of probable concessions from foreign countries.
4. For the publication of 3,000 additional copies of the Patent Office Gazette, to be apportioned among senators and representatives, to be distributed among manufacturers and mechanics.
5. To provide for the registration of trade-marks used in interstate commerce.
6. Providing a fee of \$5 for petitions in interlocutory proceedings.

#### Hint for Credit Men.

Credit men in manufacturing establishments should be on their guard against an individual who signs himself Marshall Larkin and wishes quotations on bicycles, parts, sundries, etc. A Chicago commercial agency furnishes this information concerning Larkin: A short time ago one Patrick Larken—Patrick and Marshall are supposed to be twin in business—stepped into the agency and, after stating that he lived at 532 Cornelia avenue in that city, averred that he was worth \$30,000. This was two months ago. At that time Larkin said he understood upon reliable authority that bicycles costing \$15 could be retailed with ease at \$40, and was desirous of a credit rating in making purchases. Inquiries are coming in to the commercial agency from different concerns requesting information as to Larkin's credit rating. The agency people, however, cannot find Cornelia avenue on the charted map of Chicago, nor can they get trace of the flat buildings and real estate which he says have a total value of \$30,000.

## COMMERCE IN FOREIGN MARKETS

**MAKING COLLECTIONS IN GERMANY**  
 In Germany all small suits which amount to \$75 or less go before the Amtsgericht (ordinary court of justice). A lawyer is unnecessary. All amounts above \$75 must go before the Landgericht (provincial court of justice). A lawyer is obligatory. In this court the plaintiff must deposit beforehand a sum sufficient to cover all the costs, in case the suit turns against him. Not only can the court demand this deposit, but the opponent as well.

An American who is trying to collect an outstanding debt, if he has no acquaintances in the town or city where the debt exists, should address himself directly to the Amtsrichter for information, and in due time, a reply will be received. If the amount is less than \$75, the Amtsrichter will take charge of the matter and in time adjust it. If the amount is more than \$75, it will be placed in charge of an attorney, who will take the case before the Landgericht.

Definite laws govern attorney's fees. Fees are charged in proportion to the actual value of the case in hand. The following table will give an idea of these charges. It must be borne in mind that these fees do not cover court charges (which, by the way, are not high) and other incidental expenses. These figures represent only the fee for attorney.

\$1,600 to \$1,850, inclusive.....	15.00
\$1,850 to \$2,380, inclusive.....	16.00

For all amounts between \$2,380 and \$11,900, a fee of \$1 will be charged for every additional \$476; for amounts between \$11,900 and \$23,800, a fee of 75 cents for every additional \$476; and for all amounts above \$23,800, a fee of 50 cents for every \$476. If an attorney has been put to any expense, this, of course, must be refunded in addition to the regular fees. If an attorney has to do any traveling, \$5 per day must be allowed him extra for this purpose.

There are no special drawbacks, as is usual in such matters. There is more or less procrastination; but, on the whole, an American going to law will find that his interests will be guarded as impartially as those of a native, and that the decision will be in harmony with justice and German law.

**THE DANISH CYCLE MARKET**  
 Denmark is a country designed by nature for cycling and it is not surprising to find that such a large proportion of the population are cyclists. For some time the country has been swamped with American machines, but the native manufacturers do not fear this competition as much as that given by the Germans, which they expect to see increase. The Germans make a very cheap machine and give long credits, which attract the agent. American machines which are at present selling best in Denmark average about \$34.

The majority of the farmers and their families ride and even in many cases the

servants and stablemen also, the machines used being American. There is a fear among the trade that sooner or later there will be a surplus in the German market and that the surplus will in all probability be sent to Scandinavia, as being the most convenient outlet, being a part of the world that can take a lot of machines; and there is a probability that these machines will undersell the Americans and drive them off the market.

If American makers would turn out an attractive looking machine to retail in Denmark at \$55, a fair trade could eventually be done with them. The possibilities of Danish trade must not be gauged by the size of the country, or the total of the population, because a large proportion of the goods sent into Denmark go there only to be passed on to Russia, Finland, Norway and Sweden.

**SELLING DIRECT OR THROUGH BROKERS**  
 There are three methods by which a foreign outlet can be secured for cycle goods. They are: 1.

Dealing altogether with export commission houses or importers; 2. dealing direct with the foreign retailer; 3. dealing with all three, but giving such prices and terms to the first two as will admit of an inside price to the latter, and thus protect and encourage them to sell the goods among their own customers. The first mentioned method has the call at present, but is likely to be superseded when this country has better international banking facilities.

Trading with export commission houses is clean business, though now and again snags, in the shape of rascally brokers, are encountered. By it there is the least expense connected with the procuring of orders and the least expense in handling it. These houses employ men who are expert in foreign shipping and custom house requirements and when errors occur from carelessness they shoulder the blame. Having large quantities of general merchandise to ship, they are in position to demand and secure the lowest freight rates, and in case of loss in transit they can always get a better settlement than the manufacturer. In the absence of accurate mercantile reports pertaining to the reliability of foreign buyers, their past experience with such concerns is the best evidence one can get, and this information is always available for patrons. The most desirable feature of this method of transacting a foreign trade is the possibility of doing a safe business without the risk of loss through failures.

Several of the New York commission and export houses are willing to agree that the manufacturer or merchant shall secure his own orders and guarantee that the goods are up to the grade contracted for. The export house will handle the merchandise, supervise the shipping and guarantee the payment of accounts for from 4 per cent to 5 per cent. For the handling, shipping and making out the papers 1½ per cent is charged, and the rate for guarantee rates range from 2½ to 3½ per cent.

Among the disadvantages of selling through commission houses may be cited the fact that the profit is smallest; the chance of gaining an individual reputation is lessened, and either exporters or importers may at any time substitute a cheaper article to take the place of your

goods. Not being in direct touch with the foreign consumer, it is difficult to ascertain when your goods are being superseded, and not the least of the disadvantages is the fact that if your product has a high reputation abroad, both export firms and wholesale importers as a rule will demand the lowest priced goods bearing your name which you make. Therefore the general tendency of this method of trade is to reduce grades.

There are few makers who possess the facilities for handling the delivery of small orders or for securing credit information on small foreign concerns, and on this account selling direct to retailers is generally regarded as impracticable.

By adopting the compromise plan the maker has two strings to his bow. By it he has the advantage of building up a reputation for his product, which is by no means harmful to the commission house or importer, for the reason that the extra demand created brings orders to them without their effort. It keeps the maker in direct touch with the demand and its changes, and is a desirable method to pursue in localities which are not of sufficient importance to attract the notice of either of his allies.

**OUR CYCLE TRADE IN BOHEMIA**  
 Bicycles are popular in Bohemia and the roads are good. Most of the machines are imported from England, Germany and the United States, although there are six domestic manufacturers. Bremen and Hamburg are the receiving ports. Retail prices range from \$48 to \$100. The demand is principally for cheap bicycles. They should not be very light in weight. The best merchants are engaged in the bicycle trade, some making a specialty of it and others selling bicycles in connection with hardware, machinery and guns. Whatever literature is sent into Bohemia should be printed in German and Bohemian. It is surprising to note how this market has been overlooked.

**WHERE ONLY RICH PEOPLE RIDE**  
 Bicycles are only used by the well-to-do class in Tunis, on account of high prices. The principal roads leading to the largest towns are very good and entirely adapted to the use of bicycles, but the small roads from country town to country town cannot be used by wheelmen, especially in the winter season. There are no manufacturers of bicycles in Tunis, the bulk of machines sold being imported from France. The receiving port is Tunis, and port charges are very moderate. There are no bonded warehouses, no wholesale importers, or retailers as yet.

**AMERICAN BICYCLES IN CHILE**  
 Most of the bicycles sold in Chile are from America, though some are imported from Europe. The American bicycle gives the best satisfaction and is the cheapest. There is a good field there for the product of American factories, but until there are better banking relations between Chile and the United States the bulk of the trade will go through English houses, as all drafts have to be bought on England.

It is said that the French are putting an acetylene gas lamp on the market, which is retailed at 30 cents. The Rothschilds must be making it.

# Current Cycle Manufacture

In the following table, which will be continued in subsequent numbers of THE CYCLE AGE, will be found an amplification of that class of information which is customarily given in catalogues issued by makers of bicycles, saddles, bells, lamps, chains, rims, cyclometers, etc. It will serve as a handy reference for dealers.

## HINTS FOR REPAIRMEN

### Apparatus for Detecting Leaks in Inner Tubes—Method for Removing Frame Dents

Repairers have long been annoyed in locating small leaks in the inner tubes of double tube tires by not being able to safely and sufficiently inflate the tube. Many makeshift expedients have been employed to obtain heavy air pressure without bursting the tube, but none have been entirely satisfactory. Instances where inner tubes have been replaced in casings without having been rendered completely air tight are numerous.

Albert J. Darch, a cycle dealer and repairer in Butte, Mont., has invented and applied for a patent on a device which will allow repairmen to inflate inner tubes to practically a riding pressure without distorting or endangering them in any way. The appliance is simple, comprising, as is shown in the accompanying illustration, a casing of substantially the same form as an ordinary double tube tire cover, but made of thin brass wire netting loosely woven and supported and maintained in shape by a rim of thin sheet metal. This rim is in two annular parts, which are brought to-

gether by hooks as indicated in the drawing. One of the joining edges is formed with an annular offset flange, so that the two overlap and when closely hooked together form a smooth and tight joint. Coinciding notches in the two edges form a valve hole. The interior is perfectly smooth, and chafing or pinching of the inner tube when in place is impossible.

When it is desired to locate a small puncture in an inner tube the divided rim of the casing is unhooked and the parts separated to allow the tube to be slipped inside with the valve projecting through the hole provided for it. The rim sections are then hooked together and the inner tube inflated, the wire netting restraining it against undue expansion. The woven casing with its inclosed inner tube is then immersed in a tank of water, being laid on its side. A convenient way of marking the puncture when it is located is that recommended by the inventor, which is to make a cross upon the netting with an indelible pencil. The puncture can, however, be marked in any other way desired by the operator. The remaining operations are, of course, to deflate the tube, remove it from the casing and patch the puncture.

Though the greater number of punctures in inner tubes occur either on the

tread portion or on the sides, it occasionally happens that there is a puncture on the rim side of the tube. When this is the case the locating of the leak is slightly more difficult with this device on account of the necessary rim for the wire inclosing fabric covering such punctures. Bubbles will escape, however, when the tubing is immersed in water, and the approximate circumferential location on the tube can be marked on the tread portion. Then, after the tube has been removed from the restraining casing, the rim side of the tube may be examined at the circumferential point marked on the tread and the exact location of the puncture thus determined.

The casing is made in a standard size for 28-inch by  $1\frac{5}{8}$ -inch inner tubes. It having been found that the elasticity of inner tubes permits the inflating of smaller or larger tubes, and also tubes for 26 and 30 inch tires, with perfect safety, no other size is made. The repairer using the casing is thus afforded a universal device which will receive all standard sizes of tires. Tires of 20 and 24-inch diameter do not come to repair shops in sufficient numbers to make necessary special provisions for them. The casing will take either endless tubes, such as are used in detachable tires, or double end tubes for laced tires.

Mr. Darch is ready to supply his device to the trade.

#### TO REMOVE FRAME DENTS.

Splicing has been the most commonly employed means for repairing frame dents, large kinks and smashed tubes. There are, however, some disadvantages to this method, prominent among which is the liability to sprung frame tubes unless the insertion of the new section of tubing has been very carefully executed. Splicing also requires no small amount of time and labor. In the drawings herewith is illustrated a method for removing dents by a pneumatic process which has been followed with considerable success.

Leather faced clamps are fitted to all of the openings into the interior of the frame, rendering the latter practically air tight. Through a valve provided in one of the clamps air is then pumped into the frame by a foot pump, the dented part of the tube being heated at the same time. The outward pressure of the air on the inner wall of the tube will expand it to its normal shape.

The process to be valuable in a repair shop must be carried out by means which will be universal; that is the vent closing clamps must be of such design that they will fit all frames. The clamping devices shown in the illustration have this characteristic. The clamp for the head consists of a couple of heavy plates or washers lined with leather and clamped together by a draw bolt running through the steering head. The washers if made at least one and one-half inches in diameter will fit any size of steering head, and the draw bolt may be long enough to cover the existing range of head lengths. The hanger clamp is made in precisely the same manner, the proportion of the parts being adapted to the purpose.

Unless the rear forks and stays have open rear ends, which is rare, the only other clamp necessary is that for the seat mast, and this clamp may carry the inflating valve. If air is apt to leak through the rear forks the opening from the crank

bracket to the forks may be plugged in any suitable manner before the bracket clamp is attached. The seat mast clamp may comprise a leather lined washer similar to the others and may be attached by any means which will permit it to be fitted to any frame. A regular tire valve is used, preferably one with metal stem. The clamp shown attached in Fig. 1, and in detail in Figs. 2 and 3, is suggested as a suitable universal clamp. The cover washer is provided with two ears diametrically opposite and bored vertically, the holes being tapped to receive strong set screws which at the top are furnished each with a curved yoke attached in a manner similar to the attachment of the freely turning clamping end of the screw in an ordinary iron clamp. An iron ring is hung in the yoke

on each screw and when the clamp is attached to the frame a rod is placed under the top frame tube in the corner formed by its union with the seat mast, and another rod passed under the corner between the rear stays and the seat mast. The rods bind against the lower side of the rings, so that when the set screws are screwed upward the clamp washer will be forced down tightly upon the top of the seat mast tube. The ring being free to catch the rods at any points in its circumference, the clamp is universal for all seat clusters, irrespective of the relative locations of the corners against which the cross rods bind.

The pneumatic method will remove the dents in good shape, but it is still open to the same objection which makes all dent-removing plans more or less vexatious—that is, the tubing must be heated at the smashed place and the enamel injured.

#### Swindled Bicycle Makers.

A well planned fraud was recently contrived by a Montreal bicycle agent and carried out with the assistance of his relatives, the victims being a firm of Canadian makers whose representative sold 25 machines at \$50 apiece, \$250 in cash and the remainder secured by a mortgage on property worth \$7,000 and which was already mortgaged for \$4,000. The bicycle makers later found that the agent, George Meunier, had acted through a relative named Eugène Labreche, and that after the sale was agreed to they went before a notary, another relative, named Bleau, for the purpose of executing the mortgage. The notary received the signature of the representative of the bicycle making firm, who was totally ignorant of the French language, in which the deed was written, not to a deed of mortgage, but to a deed of sale of property from Labreche to the bicycle makers for the sum of \$6,000, of which \$1,000 was acknowledged

# FINISH....

The finish of the '99 BARNES BICYCLES is in keeping with the excellent material, mechanical features and improved methods used in their construction.

The white enameled frames with royal purple steering heads and fork crowns have set the fashion for the year.\*\*\*

## RIDE THE ELEGANT BARNES

the Barnes is a Valuable One.  
Write Us.

THE BARNES CYCLE  
COMPANY

SYRACUSE, N. Y.

paid in cash, and the bicycle makers undertook to pay \$3,000 to a hypothecatory creditor and \$2,000 to Meunier. Upon discovering the true state of affairs, the bicycle makers offered to return the \$250 cash paid in as soon as the bicycles were returned, asking the aid of the law for the cancellation of the sale and accompanied this action by the seizure of the goods. When the case came to trial, the defendant pleaded that he never dealt with the company, but that he sold Lebreche the property in question for \$7,000, of which the sum of \$2,000 was acknowledged paid in cash, though no cash was actually paid. Only upon investigation by the court was it discovered that the notary and the other two conspirators were relatives. The bicycles were ordered returned to the makers. The \$250 paid at the outset by Meunier was left with the makers, it being shown in the course of the testimony that five machines had actually been disposed of by Meunier.

### Considering "Junk Dealers" Case.

Washington, March 13.—The test case of John D. Lasley against the District of Columbia, brought to determine whether bicycle dealers selling second hand bicycles, taken in trade, can be made subject to a license tax of \$40 per annum for dealing in second hand personal property, was argued in the Court of Appeals last week. The court now has the matter under consideration and will probably render an opinion within the next month.

### Road Instruction By Agents.

In the east bicycle agents will be this season more accommodating than usual to the women customers. In Springfield, Mass., for example, if a woman purchases a machine she can have the services of a road instructor for nothing. Agents who

last season conducted riding academies will this year complete the cycling education of their customers on the highway and accustom the timid ones to the dangers of travel.

### An Automatic Toe Clip.

The most recent toe clip of the self-adjusting kind is the invention of P. E. Erickson of Port Chester, N. Y., and is illustrated herewith. The clip comprises two curved sections which are hinged together by the bolt that attaches them to the front side plate of the pedal. Ex-

THE CYCLE AGE

tensions on the inner ends of the clip sections cross each other and are curved to rise above the tread of the pedal plate. Thus when the rider's foot is placed upon the pedal it will press the extensions downward and raise the outer arms of the clip till they inclose the foot. A light coil spring is secured between the lower portions of the two arms so as to keep the clip open for the insertion of the foot and projections on the arms in conjunction with a lug on the washer which is interposed between the clip and the pedal keep the arms from dropping too low when the rider's foot is off the pedal.

### Sundries Dealers Evince Interest.

Twenty-five manufacturers of bicycles are reported to have asked for space at

the coming spring cycle show that will open in New York city March 23 at Grand Central Palace, and prospects indicate that this number may be doubled before the opening. A number of the makers who have been allotted space are recognized leaders in the trade. The manufacturers of sundries, however, appear to be especially favorable to the exhibition and a large number are expected to have booths.

The first dealers' cycle show for the eastern metropolis holds forth promise of being a creditable essay. Only one obstacle of real importance was at first encountered by the management; that was that the dates of the exhibition threatened to interfere with work in stores during the early activity in the selling season. But a weighty argument in favor of the dates was found in the timely and profitable advertising to be secured at a spring show for the public. A number of the dealers discovered that they could attend to old customers and visitors at their stores and still manage to take time to win some new customers at the show as exhibitors.

The management is now occupied in the endeavor to satisfy dilatory applicants for large spaces with locations that are left and in renting small spaces to those who are not so difficult to please.

### That Paralyzing Solar Plexus Blow.

During the last four weeks American cycles and cycle stuff to the value of nearly \$125,000 have been shipped to Germany. What's the matter with those German manufacturers who purposed paralyzing American competition by refusing credit to any German dealer who touched the American "monster"?—Baltimore Globe.

There are fifty cycling clubs in Berlin.

## SUBJECTS OF GENERAL INTEREST

### FUTURE RATE OF INTEREST

What will be the future rate of interest on investments? Prominent bankers throughout the country are inclined to think it will not be more than 3 percent. The Secretary of the Treasury says on this subject: "Looked at in the light of probabilities, with the general average conditions, social and national, which have prevailed for twenty years past, and taking into account the rapid increase of capital and the growing economies in production and distribution, it would seem that the tendency of interest was permanently downward, and that it would be hazardous to estimate a rate higher than 3 percent, as an average available return upon high-grade securities during the next twenty years. On the other hand, with our country largely undeveloped in its latent resources, as it is, affording still room for the intelligent application of capital to the development of such resources, it would seem to me that 3 percent might be fairly estimated to be a realizable average rate."

### NICARAGUA CANAL PLAN CRITICIZED

It is the prevailing opinion in governmental circles that before undertaking the construction of the Nicaragua canal a thorough and impartial investigation of its commercial value should be made. Certain obstinate facts are in the way of the construction of the project just at present and they are being made much of by those who oppose hasty action. It is pointed out that the distance from New York to Manila is 181 miles less by the Suez canal route than by the Nicaragua canal route. It is also shown that the distance from London to Manila is 5,080 miles less by the Suez canal route than by the Nicaragua canal route. There are, however, two important facts to be taken into consideration in connection with the item of distance, viz.: The Suez canal is a sea level canal, whereas the Nicaragua canal involves 220 feet of lockage. The other fact is that the Suez canal route is greatly superior to the Nicaragua canal route in point of coaling facilities. Estimated that the equated distance, embracing mileage, lockage and coaling facilities, would be equivalent to 2,000 miles in favor of the Suez canal for trade between New York and Manila, and to 7,000 miles for trade between London and Manila.

In a word, if the Nicaragua canal were completed the commerce of the Atlantic seaports of the United States and of all Europe, with Asia and Australasia, in steam vessels would for all time continue to pursue the Suez canal route. The government is now sending its transports and war ships to Manila by the way of the Suez canal and would do so even if the Nicaragua canal were now completed. Sailing vessels will never pass through either the Suez canal or the Nicaragua canal for lack of wind and the enormous cost of towage by either of the canal routes.

The transcontinental rail lines will, for all time, secure all the passengers, all the mails, all the express goods and all the perishable freights and fast freights between the Pacific coast and the Atlantic and Gulf coasts, leaving to the competition of the canal route only the residuum of low-class freights, and in all probability will beat the canal route for that. If the Suez canal were subject to such railroad competition it would at

once be financially ruined. It is debarred from such competition by physico-geographical considerations.

The general conclusion from the foregoing and other facts of equal significance is that the Suez canal and the transcontinental railroads of the United States have destroyed the commercial possibilities of any American isthmian canal which may have existed thirty years ago.

It appears to be a cause of regret that the pending bills in Congress for the construction of the Nicaragua canal were formulated with no reference to the foregoing facts and in the light of no inquiry by Congress as to the commercial value of the proposed Nicaragua canal. This is contrary to the fixed policy of the Government as to investigations in advance of construction. The military importance of the work is also as much in doubt. The canal proponents have thus far strenuously opposed such inquiry. The preponderance of professional testimony is to the effect that the proposed Nicaragua canal would be a source of weakness rather than of power.

### THE COAL SUPPLY IS INEXHAUSTIBLE

An apprehension that the world may be within measurable distance of the exhaustion of its coal supply must be dismissed as an idle fear. One who has investigated the mineral resources of China reports that the whole southwestern part of the province of Hunan may be called one coal field, covering in all some 21,700 square miles. Over large areas of this territory the coal measures are visible on the surface, and the coal is said to be generally of excellent quality. In the province of Shansi, too, there is another vast and easily workable coal field. At the present rate of coal consumption the world, it is estimated, could be supplied by China for 10,000 years to come. Thus, should the western coal fields become in time exhausted, the far east will easily make up the deficiency and keep the stoves and furnaces of the world in fuel for as long a time as any one now living need worry about.

### GLASS PUT TO A NEW USE

Glass is constantly finding new uses. A firm of glass manufacturers in western Pennsylvania, is making glass pipes for the conveyance of oil, gas, water or sewage as a regular commercial article, and an Ohio oil company is putting in a line of the glass pipe, about 100 miles in length, which will afford a practical test of its advantages. As the glass does not corrode and is unaffected by electrolysis when in the vicinity of electric tracks or conduits, there seems to be a large field of usefulness before this kind of pipe.

The Philadelphia Cycle Board of Trade was represented at the meeting of national and local trade organizations held in that city last Monday to make arrangements for the exposition of American manufacturers, which will open in Philadelphia next September.

The Connecticut legislature is considering a good roads law, at an annual cost of \$250,000. The committee recommends a commission, and reports its belief that the state should pay the greater part of the expense in improving highways in small towns.

### RAPID DEVELOPMENT OF THE SOUTH

While the public has heard a great deal about the resources of the south and the progress which that section is making, its advantages are by no means fully appreciated by the business people of the north. It should be remembered that the south has a very remarkable combination of advantages not possessed by any other one country or section of the world. It produces about three-fourths of the world's cotton crop, furnishing the raw material for the vast textile interests of Great Britain, the Continent and New England. This industry, representing over \$1,500,000,000 of invested capital, is gradually tending toward the cotton fields. In all parts of the south, and especially in the Carolinas, Georgia and Alabama, very rapid progress is being made in cotton mill building. The south now has over \$120,000,000 invested in cotton mills, against \$61,000,000 eight years ago, and about \$5,000,000 more is going into new mills now under contract and extensions which are being made to existing mills. Throughout the south the dividends of cotton mills have averaged for some years eight to ten percent a year after adding, in many cases, ten to fifteen percent to the surplus fund.

In pig iron production the south is making equally as rapid progress as in cotton manufacturing, Birmingham, Ala., having exported during last year an average of nearly 1,000 tons per day.

Taking into consideration the fact that the south seems to be able to produce iron at a lower cost than other sections, and that it has an unlimited supply of ores, coking coal and limestone, no limit can be set upon the probable extension of the iron, steel and coal interests of that section. When we consider that the manufacture of cotton has enriched England and New England, and that the production of coal and iron and steel have made Pennsylvania enormously wealthy, and that the lumber interests of the northwest have created great wealth and developed a vast business in that section, we can form some idea of what it means to the south and to the entire country that all these advantages in practically unlimited supply and of superior quality are found in that section and nowhere else in combination.

The south for the last fifteen years has been passing through an experimental period in which the mettle of its people and the inherent strength of its business interests have been undergoing such a test as was never given to any other section of our country. That they have stood the ordeal and have demonstrated to the business world the soundness of the whole southern situation is now universally admitted.

Another fact of great importance to the future of the south, and one which bears directly upon the commerce of our country, is the striking advancement that is being made in the development of southern ports. At Galveston, New Orleans, Pensacola, Mobile, Savannah, Norfolk, Newport News and other ports extensive enlargements of terminal facilities are being made at a cost of some millions of dollars. At Newport News the great ship yard, now employing 5,000 hands, has \$20,000,000 of work under contract. Though Newport News is comparatively a young place, its growth being a matter of about ten or twelve years only, its export trade last year amounted to about \$40,000,000.

## RENOUF'S UNTENABLE THEORY OF FRONT AND REAR WHEELS

Small Rear Wheel Will in No Wise Assist the Front Wheel to Climb Obstructions.

Readers interested in bicycle design noticed in the March 9 issue of this paper an article in which the well-known English bicycle engineer Renouf is quoted as advocating the reduction of the size of the rear wheel in bicycles for the purpose of raising the direction of the thrust from the driving wheel to the front wheel above the horizontal and thereby facilitating the passage of front wheel over obstacles in the road. Mr.

THE CYCLE AGE

Renouf would rather reduce the size of the rear wheel than increase the size of the front wheel, because he holds that a 28-inch front wheel has just the right dimensions for the best disposal of the handle bar when the steering head is of the length which he prefers. Otherwise his argument would favor a large front wheel.

He reminds of the ease with which a barrow is pushed over a curb by dropping the hands low and of the shock which is felt when the hands are not dropped, and takes it for granted that the thrust by which the front wheel is pushed forward travels from the rear wheel axle through the rigid frame to the front wheel axle. By dropping the rear wheel axle lower he therefore expects to obtain the inclined thrust which he desires.

### Bicycle Driven from the Ground.

It may be well to call the attention of Cycle Age readers to the fallacy of Mr. Renouf's reasoning when he supposes that the effect is the same whether he

THE CYCLE AGE

increases the size of the front wheel or reduces the rear wheel.

He overlooks that the point of ground contact of the rear wheel is in reality the point from which the forward thrust issues. While revolving, and therefore not rigidly connected with the bicycle frame, the rear wheel when considered as a driver is held rigidly to the extent of the thrust applied by means of the rider's foot on the pedal and the pressure transmitted through the chain. It is rigid in one direction so long as it is used as a driver, and the thrust by which the front

wheel is caused to rotate always takes the direction from ground contact of rear wheel to axle of front wheel—that is, it is always inclined at a sufficient angle upward and forward to help the front wheel over obstructions. The height of the rear wheel axle makes no difference in this respect, but that of the front wheel does. Mr. Renouf should therefore on his own basis of thought advocate the large front wheel and not the small rear wheel and by so doing would be in accordance with the time-honored English design which prescribes 28-inch rear and 30-inch front wheels.

### Advantage of Low Built Frames.

In his line of reasoning Mr. Renouf has left out of consideration the forward thrust caused by the momentum of wheel and rider, although this thrust under nearly all circumstances except such as prevail at laborious hill-climbing, largely exceeds the thrust of mere acceleration received from the rear wheel.

Considering the rider as rigid with his mount—for simplicity's sake—it is readily seen that this thrust travels from the center of gravity of rider and mount combined to front wheel axle and that the direction is one of a downward slope of the particular kind which Mr. Renouf desires to avoid when obstacles are encountered. It is also seen that the direction is aggravated when the rider is placed unusually high, as on a bicycle with a high crank hanger and a correspondingly high seat. The farther back over the rear wheel the rider is placed the smaller will be the angle of the thrust, but, on the other hand, if the rider bends forward and lowers the center of gravity the angle will also be reduced. If the supposition is that the bicycle must pass over the obstacle in its way with both front and rear wheels without changing the rider's position, the most favorable attitude is undoubtedly the customary scorchers' position on a low-hung machine, because this position divides weight nearly equally between front and rear wheels so as not to lose when the rear wheel passes over an inequality what was gained at the front wheel. This position has also the advantage that it pivots the weight of the body partly on the shoulder joints, so that the tendency to bear down on the front wheel caused by momentum when an obstacle is met, is very materially lessened by allowing

the body of the rider to swing forward while the obstacle is scaled.

The various positions and lines of thrust are indicated in the accompanying illustrations, and it is seen that a brief analysis of Mr. Renouf's argument from a practical standpoint leads the reader back to the bicycle design which is most in favor in the United States—the low-built frame with 28-inch rear wheel. There remains a suspicion that an increase in the size of front wheel might be desirable, but that is not what Mr. Renouf contended.

## AN IMPORTER'S TRIBULATIONS BOYCOTTED BY COMPETITORS

Danish Manufacturers Try to Make Capital of Jens Nielsen's Advocacy of Cash Export Sales.

In the issue of December 28, 1898, of this paper there appeared an article setting forth the bad experience which several of our manufacturers have had with exports of bicycles to European countries, when the bills were not paid in full against shipping documents, and part of a letter from Jens Nielsen, an importer in Copenhagen, Denmark, to "The Foreign Buyer" of New York was reprinted in the article so as to show that the better class of European importers themselves were opposed to the practice of credit sales on account of their tendency to disestablish current prices, if the buyer refused to accept the goods, and the latter were thrown upon the market at sacrifice.

### Harsh Means to Down Importers.

This article has proven the signal for the Danish sporting paper "Idraet" to fall over the enterprising but innocent Jens Nielsen and accuse him of being a traitor to his country. The trouble lies apparently in the statement made by Jens Nielsen that "the home manufacturers do not amount to much" and another remark to the effect that "every respectable firm on this side pays cash against bills of lading."

Considering that Mr. Halberstadt and other Danish and Anglo-Danish manufacturers probably see a slight in Mr. Nielsen's reference to the small capacity of their works (which is, in fact, very small for supplying all of the territory contributory to the free port of Copenhagen), and that several importers in the same city who prefer to buy on credit nevertheless consider themselves respectable, it is not to be wondered at that some bad feeling has been aroused, but Idraet and the Cycle Dealers' Association of Copenhagen have gone further. They have taken the extravagant measure of attempting to have Mr. Nielsen and the cycle paper "Cyclen," which defends him, boycotted socially and commercially as calumniators of the Danes and vipers that sting the breast where they are coddled.

### Simple Case of Enterprise.

The hapless importer whose inclinations for cash transactions have stirred up this hornets' nest writhes under the accusations and desires that the Cycle Age make a statement exonerating him of writing the fateful article. The Cycle Age cheerfully acknowledges that he did not. He probably wrote the passage with which he is quoted, but not to this paper, and the Cycle Age takes it for granted that the worst which may be charged against him is that he is an enterprising merchant who has loved not wisely but too well to convince American manufacturers that they should deal only with those who are situated like himself, i. e., who have the cash to pay cash with.

By using his pen for this purpose he has undoubtedly aimed not solely at conferring a benefit on American bicycle manufacturers, but also at reducing the number of his own competitors, and has been actuated by a laudable desire to uphold profitable prices. But his line of argument has not been malicious or personal; neither has it been directed against his countrymen, and it is preposterous to brand him as a traitor because he tries to defend his own particular market against demoralized prices.

Evidently the patrons of Idraet have discovered in the importer's correspondence to American papers a fine chance

# WHAT WOULD YOU DO?

The only sensible way to coast is the safe way. The safe way is possible only with perfect control of the bicycle. The minute the feet are off the pedals the control is lost—coasting then becomes a danger.

Eclipse Cycles Fitted with

The Morrow Automatic Coaster and Brake

Make coasting a safe pleasure. It enables riders to hold the

pedals stationary while coasting. A slight back pressure of the pedals applies the brake. The bicycle can be stopped on the steepest hill in the shortest time and smallest space. Any wheel thus equipped can be sold—easily. All the particulars if you want them.

Eclipse Bicycle Co., ELMIRA, N. Y.

# Plain Talks on ANDRAE Cycles

## XIII—THE SEAT POST CLUSTER.

Last week we told you that if you would compare the Andrae tandem in the Andrae '95 catalogue with other '99 tandems you would find the other '99 tandem a copy in design of the Andrae '95. Did you make the comparison?

Several makers are screaming about their new (?) V-shaped seat post clusters.

Let us get to comparison again.

Take a '96 catalogue and a '99 catalogue of the other make, turn to seat post clusters and you will find that—

**THE OTHER '99 NEW (?) SEAT POST CLUSTER WAS AN ANDRAE FEATURE WAY BACK IN '96.**

We have had three years to improve our seat post cluster.

It's a new thing with others.

And still the other maker asks as much for his '96 featured wheel as we ask for the Andrae.

Write for our paper, "The Andrae Agent."

for a bit of patriotic advertising and they have made haste to utilize it in favor of home manufacture. That is the penalty of greatness. If Jens Nielsen had not sold quite so many American bicycles as he really has sold and had not said quite so much about it, he would not have been a formidable competitor of Danish manufacturers and nobody would have thought of boycotting him for advocating the cash principle. But Nielsen should rise to still greater greatness. He should turn the joke against his assailants, for Danes love a joke as much as the Briton a lord. He should advertise the boycott and make it clear to his countrymen that the patriotic fervor which ostensibly has actuated its instigators is only a thin veneer covering their inability to compete with the values which he can offer in American bicycles bought for cash. He should not get flustered, but should turn the advertising which he is receiving gratis to good account. The tempests which rage in Copenhagen do not sensibly affect trade with the provinces or with Sweden or Norway. He can continue to sell American bicycles after being scored by those who don't like to see them sold, as well as or better than before. A couple of slipshod expressions which have escaped his pen in the heat of business endeavor should not and will not mar his fortunes, when everybody can easily discern the mercenary animus of his persecutors.

#### Jens Nielsen on Contracts.

While complaining of the unpleasantness of being misunderstood Jens Nielsen finds time to rap American manufacturers in a communication to this paper on the subject of the hardships of his lot as a cash buyer, as follows:

In making contracts for large lots of bicycles and paying cash in advance, the importer on this side naturally wants a clause in the contract that he is sole importer of this special brand for 12 months—or one season. The importer in reselling the goods has to divide up the lots among his agents all round in his particular territory, or what you would call "organize the territory." The importer, who is supposed to make a little profit, in reselling his cycles, allot certain districts to his agents, same as you do in the states, I suppose. If a competitor in some part of the district—or if one of the agents apply direct to the factory in their states it would seem right and just that such orders were sent to the importer, according to the contract. However, I am sorry to say, that so far most all the factories I have dealt with, have not kept true to this part of the contract, but have not abstained from the temptation to fill direct orders at same prices or a trifle higher, and have so upset the whole organization and heavily damaged the first importer. Now, how is the importer, who pays cash in advance, to guard himself against such trespassings? He is powerless; all his work, his trouble and extra expenses for introducing a certain brand are lost and all he can do is to throw up that connection and turn to another, but only to be treated the same way over again. It is, of course, only the cash in advance payer who gets ill treated like that; such things cannot happen till "the bill is paid." Now, why will the manufacturers on your side make it impossible for the importer on this side to pay cash in advance? A cash payer ought to be placed on equal terms with those not paying cash, but, I am sorry to say, he is not. Where is the protection for bad packing, lacking parts, inferior goods, breaking of contracts for the cash in advance payer? Where the protection is for those importers, who do not pay cash in advance, that we all know. The cycle trade is a new one and is to be compared with a new rising town of gold mines—all kinds of elements rushing in, bad elements in the majority at the start till things get settled and the majority changes; I think the cycle trade today is just on the level point.

JENS NIELSENS.

An English tire firm is reported to be planning the construction of ten petroleum-driven pacing machines for use with a selected list of riders to secure the world's short and middle distance records in the spring.

Three new motor-car factories have been founded in Switzerland.

## STEAM VEHICLES RIDE EASY

### MOTORS FLEXIBLY CONNECTED

#### Engine Oscillates in Harmony With Jolts —Wagon Body Moves Freely on Springs.

From the unpleasant vibration which is a feature of most of the French motor vehicles driven by gas or steam engines many students and intending purchasers of motor vehicles have been led to believe that there were serious engineering difficulties in the way of connecting the running gear of these two classes of automobiles to the driving power in such a manner that shocks resulting from a bad road could be absorbed by springs and that vibration arising from irregularity in the torque of the driving shaft would not be felt by the passengers. The rapid wear of driving chains which has been observed in several American vehicles has confirmed this supposition.

#### A Condition of the Past.

Nevertheless it may now be confidently asserted that any shortcomings in this respect which in the past have tended to shorten the life of steam and gas engine vehicles, increase the repair bill and reduce the comfort of riding in them, have only been such as are liable to mar the perfection of the product in the infancy of any industry, and that the steam and gas engine wagons of the future may be constructed to ride as "easy" as any electric or horse-drawn vehicle.

#### Mathematics of Shocks.

One of the Stanley brothers wrote in this respect concerning their steam wagon as follows:

In our carriage the connection between the boiler and engine is flexible, so that the engine is free to oscillate. Then, the engine bed is connected with the rear axle in such a manner that the chain which is used for transmitting the power is always at exactly the same tension, and can be tightened or loosened at will by simply turning a nut. The body of the carriage is perfectly free to move up and down, or to tip from side to side with practically no resistance excepting from the springs.

Now, since our carriage weighs about one-quarter as much as an electric carriage that will run the same distance and carry the same number of passengers, we can use a much more flexible spring, and it consequently rides much easier.

The crank shaft of the engine and the rear axle are connected by a brace 30 inches long. While the body of the carriage moves up and down about 4 inches vertically, as a maximum, the crank shaft of the engine moves on an arc of a circle with a 30-inch radius about the same distance.

If the power of the engine were absolutely irresistible and the crank shaft revolved at a uniform speed, the motion of the carriage would vary about 2 inches with a vertical motion of 4 inches of the body. But the power is not irresistible; on the contrary it is limited and extremely flexible, as flexible as steam is elastic. The tendency of the crank shaft to rotate at a uniform velocity depends upon the momentum of the fly wheel. The tendency of the carriage to move at a uniform velocity depends upon the momentum of the carriage.

The fly wheel, which is simply a sprocket wheel, and all the revolving parts of our engine weigh less than 2 lbs. The carriage fully loaded weighs 800 lbs. The speed of the carriage is fully ten times the speed of the revolving parts of the engine. The force required to interrupt or change the speed of either conforms to the law of the striking force of bodies, that is, it is proportional to the weight multiplied by the square of the velocity. Since the speed of the carriage is ten times as great as the speed of the revolving parts of the engine, the force required to interrupt its motion would be 100 times as great, if of equal weight; but the weight of the carriage being 400 times as great the ratio is that of 1 to 40,000. It is almost as absurd to suppose that such a shock would be felt as it would be to suppose that you would feel a shock if a fly should light upon the dasher.

#### First Hundred Steam Wagons.

The Stanley brothers of the Stanley Dry Plate Works of Newton, Mass., have purchased the old "Hickory" bicycle fac-

tory at Newton and will at once lay down a plant equal to the production of one thousand Stanley steam wagons annually.

The Stanleys have just received their one hundredth order for their steam motor vehicles. Fifty have been contracted for by Count de Jotemps for delivery in Paris, France, and the other fifty have been ordered piecemeal by visitors to Newton who had an opportunity to test the merits of the vehicles in actual trial.

Two patterns of the vehicles will be turned out, one with seats for two at \$600 and another to carry four at \$700.

#### Motor Buses Refused Park Privileges.

The promoters of a company formed for the purpose of operating motor omnibus lines in Chicago presented a petition signed by 300 citizens living along the boulevards of the South Side to the South Park board of commissioners recently requesting that permission be granted to run twenty or more vehicles on the boulevards and park drives. The petition was promptly denied by unanimous vote of the board, however, the commissioners refusing to take the matter into consideration. The compensation offered to the commission was 10 percent of the gross receipts, if exclusive right of way was given. The backers of the company are Simeon Haskell and James S. Shortle. J. E. Otis is the attorney.

In refusing the grant the commissioners said that no concessions of any sort had ever been made by the board and the rule would not be broken now. President Donnersberger, moreover, stated that letters opposing the scheme had poured into his office. The promoters of the scheme said they would bring the matter up again, as they were confident of success and that the people were behind them.

#### Overman Adopts Steam.

A steam motor vehicle has been completed at the Overman Wheel Works. It is stated that the company has abandoned its gas engine vehicle pattern in favor of steam, and that the new wagon is controlled by the steering lever operated by the driver's left hand, while the engine is governed by another lever operated by the right hand.

#### Season Tickets for Inflating.

An English cycle repairer has inaugurated a system of season tickets for inflating tires and lubricating cycles. The twelve months' ticket for the former costs only 62 cents, a similar charge being made for the oiling, and for \$1 one may have his machine kept in good running condition for one year.

#### Effective Work of Washington Police.

The number of lost and stolen bicycles recovered by the police of Washington, D. C., increases each year. During 1896 the department recovered 117 machines, 183 in 1897, while in 1898, out of 288 bicycles reported as lost or stolen, 254 were recovered and returned to their owners. Many of these are not claimed for weeks or are held as evidence in cases pending before the courts.

Richmond, Va., will not impose a tax on bicycles. The ordinance introduced in the common council having this end in view has been rejected, under the advice of the city attorney, who held that according to the law the bicycle was a vehicle and could only be taxed in common with other vehicles.

There are now in Holland eleven concerns exclusively engaged in the construction of motor carriages, while the number of cycle factories exceed fifty.

# What you get for your money

IS AS IMPORTANT AS THE AMOUNT YOU PAY.

Have you ever thought of that? Follow out the theory and what result do you get?

Buy a pair of shoes for \$2.50. They are shoes. You get some wear out of them. (All that you pay for.) Are they comfortable, well turned and sightly? Do you have to get them repaired soon?

Add 40 per cent. to that price and buy another make. What do you get? As good a shoe as is made, don't you? One that will give you good and long service without repair; that is good looking and suits you. You've had value received in both cases, but isn't the latter the cheaper in the end?

MR. DEALER, when you select your leading bicycle for 1899 don't be penny wise. Look to your net results at the end of the season.

What  
Does That  
Mean?

# GASOLINE MOTORS

THE ONLY RELIABLE MOTORS FOR HORSELESS VEHICLES.

OURS can be run at cost of less than 1-2 cent per hour (2 horse power—larger ones same ratio). SPECIAL MOTORS and TRANSMISSION GEARS for Carriagemen and others to construct THEIR OWN VEHICLES.

**W**E believe this to be the very best Gasoline Motor ever placed on the market for simplicity, durability, more power and less weight than anything ever produced. Especially adapted for Motor Wagons Boats, Small Electrical Plants, Elevators, Machine Shops, Optical Works, Printing Presses, Feed Cutters, Carpenter Shops, Lathes, Emery Wheels, Corn Shellers, Laundry Machines, Pumping Water, Ice Cream Freezers, Irrigation Machinery, Ventilating Fans, Hay Presses, Cream Separator, Sewing Machines, Mining Machinery, Sawing Wood, etc., etc.

These Motors are manufactured horizontal or upright. They are absolutely safe, and cannot explode or cause damage, and are always ready for instant service. They require no mechanical experience or licensed engineer.

Our 2-horse-power Motor weighs but 89 pounds, and occupies a space 24x11 inches; runs at high speed and high compression.

Working parts are all tightly enclosed; one sight feed oil cup lubricates all bearings. Our ignition device is perfect, and all wearing parts are especially strong and substantial.

A  
Word  
Concerning  
This  
Year's  
Business

Merely to see the Waverley Bicycle for 1899 is to create the desire to be mounted on it, to fly along over the smooth, hard roads that will soon come. The

1899  
**Waverley**  
\$40

is the handsomest and richest looking bicycle yet produced—that is the unanimous testimony of those who have seen it—while those who have ridden it (the 1899 models have now been tested for months) are enthusiastic over its smooth, noiseless running.

Combined with the IVANHOE line of good lower-priced bicycles, the Waverley gives the strongest foundation for a profitable business this year. Write at once for the agency.

in a limited way. More next week.

# THE PASTIME AND SPORT

## DATES SET FOR BIG MEETS

**International Meet Convened in Montreal August 7—League Meet Opens the Week Following.**

Last fall when the International Cyclists' Association awarded Canada the World's meet for 1899, a strong committee was organized in Montreal which immediately set to work to devise means of defraying the expenses of promoting the meet, but the refusal of Canadian manufacturers to take part in the cycle show seemed to have smothered their enthusiasm and very little was done during the past few months.

But hustling President Porter, of the Boston Meet Committee, visited Montreal last week by appointment to meet President T. A. Beament and the local committee of the C. W. A. for the purpose of deciding on the date for the international meet, and after a very harmonious conference it was definitely decided to hold the big meet during the week beginning August 7, and the L. A. W. meet at Boston the following week.

### Outlaws to Be Barred.

The fixture of dates has given fresh impetus to Canadian interest, and the Montreal and Boston committees will work together from now on.

The riders under suspension by the L. A. W. will either have to make their standing good with the L. A. W. or refrain from participating in any Canadian race meets.

Many projects are being considered in connection with the holding of the League meet in Boston, August 14 to 19. The officers and members of the Boston '99 Meet Club have, for a number of weeks been working hard on the preliminaries of the great meet, with the determination of making it second to none ever held by the American wheelmen. During the month of August representative racing men of Great Britain, France, and, in fact, all European countries, will be here to compete in the international contests to be held at Montreal.

### Special Circuit for Foreigners.

The authorities of Montreal and Boston have practically agreed upon the establishment of a circuit of races in which the foreign racing men can compete for good prizes previous to the final contests at Montreal and Boston. A European steamship line, having terminals at both Boston and Montreal, has agreed to bring the foreign racing men to this country at reduced prices. The object is to bring the men to this country at least a month previous to the holding of the meets to give them an opportunity to learn the ways of the American racing men in competition, as well as give them an opportunity of becoming acclimated. Were it not for this special circuit, the men would have to leave their native countries some time before the holding of the meets, in order to become acclimated and waste much unprofitable time in training.

This will certainly have a tendency to attract the foreigners, and there is every reason to believe that this year America will see more foreign racing men of ability than she has since the early '80's.

### Opening of Texas Circuit.

Sunday, March 5, the first race meet was run on the new eight-lap track built at Houston, Tex., by Jack Prince, who

intends to run a circuit of similar meets in the south during the spring. The races at Houston were well attended. Several amateur events competed by local riders and two open professional races were run. The mile open professional was won by Bob Miller in 1:53, with Walthour second. Bert Repine ran first in the three-quarter-mile professional. Arthur Stone was second and Walthour third.

### N. C. A. Activity in New England.

Springfield, Mass., March 13.—Henry E. Ducker, manager of the Charles River park, Boston, and A. G. Batchelder, chairman of the board of control of the National Cycling Association, held a conference in this city tonight which is said to be preliminary to Ducker, his followers and the Charles River track coming into the N. C. A. camp, bag and baggage. Batchelder has also approached the Springfield Bicycle Club, which is under L. A. W. suspension, with a proposition to run a tournament under N. C. A. auspices. R. F. Kelrey, a former L. A. W. handicapper, is working in the interests of the N. C. A. at Hartford. The present outlook, therefore, is that about all the racing of consequence in New England this season will be under N. C. A. control.

### Urging Anti Six-Day Law.

The Collins bill to prohibit the running of six-day races in New York state is receiving the hearty support of the state division L. A. W., which is urging citizens in all parts of the state, through the agency of the daily press, to write letters to their assemblymen and senators asking them to aid the passage of the measure, which is said to be approved by Governor Roosevelt. The prohibitory clause in the bill is as follows:

In a bicycle race or other contest of skill, speed, or endurance, wherein one or more persons shall be a contestant or contestants, it shall be unlawful for any contestant, to continue in such race or contest for a longer time than twelve hours during any twenty-four hours. The proprietor, occupant or lessee of the place where such race or contest takes place, consenting to, allowing or permitting any violation of the foregoing provisions of this section is guilty of a misdemeanor. The manager or superintendent of such a race or contest consenting to, permitting or allowing any violation of the provisions of the first sentence of this section is guilty of a misdemeanor.

This act shall take effect immediately.

### May Abandon Chicago Race.

Trainer John West returned to Chicago from San Francisco in advance of the racing men to secure a suitable building as near the center of the Windy City as possible for the running of a six-day race next month. The Tattersall building is engaged for April and May for other purposes and it seems probable that the plan may have to be abandoned.

### Ziegler's Return to the Track.

San Jose, Cal., March 13.—The bicycle races yesterday afternoon were largely attended, but a gale interfered with the riders. Otto Ziegler formally returned to track racing, doing the half-mile exhibition behind Fournier's infernal machine in :49 3-5, with only three days' actual training. McFarland rode a paced mile in 1:35.

Munich, the capital of Bavaria, has 35,000 wheelmen and sixty clubs, but the clubs have few members.

## A. N. A. RACE MEETS CONCLUDED

**Walne Wins Scratch Event at Electric Light Meet—Carpenter Captures Australian Cup.**

Sydney, Feb. 13.—The Australian Natives' Association meet was continued on January 28 and concluded February 4. The day attendances were only fair, owing to the uninteresting programs each day, but the public turned up in large numbers to witness the racing in the evening by electric light. Walne again demonstrated his superiority by winning the scratch race. The much talked of team race was a "frost" and disgusted the public. The Australian Cup race, run in fifteen heats, was won in great style by Carpenter on an American machine. Summaries of the races:

One-and-one-half mile Australian Cup handicap; final heat—G. Carpenter, 150 yards, first; G. Bishop, 175 yards, second; J. Robertson, 135 yards, third. Time, 3:14 3-5.

Two-mile team handicap race—Barker, Denning and Tame, 60 yards, first; R. W. Lewis, Auger and P. Beauchamp, 80 yards, second; Murray, Morgan, and Webster, 90 yards, third. Time, 4:57 2-5.

One-mile scratch—R. H. Walne, first; R. W. Lewis, second; F. Beauchamp, third. Time, 2:29 2-5.

Three-mile team race—Morgan, Gordon, and Webster, 100 yards, first; Lewis, F. Beauchamp, and P. Beauchamp, 40 yards, second; Relph, Jackson, and J. Carpenter, 65 yards, third. Time, 6:45.

### Australia's Major Taylor.

Australia can boast of a good colored rider as well as America. S. E. Gordon, a dusky crack, is rapidly coming to the front and has won two big handicaps off short marks as well as other events this season in Victoria. He is a splendid sprinter and gives promise of developing into a champion. Unlike Major Taylor, who is not given a fair deal by American riders, Gordon is not interfered with in any way by other riders while competing in a race. He is also popular with the public. If he takes proper care of himself he has a great future before him as a racing cyclist. Among his wins are the L. V. W. Cup \$500 race and the Federation \$335 Handicap.

### The N. C. U. Badly Duped.

Recently an Australian supposed amateur visited England—by name Percy E. Marsden. While in England he lowered a number of world's and British amateur records, and was much boomed by the English press. He also competed at several race meets in amateur events. Marsden took Johnny Bull in very badly. Before he left Australia he was disqualified for six months for getting the Melbourne to Sydney record "in a train," and while under this disqualification he went to Tasmania and competed for cash. On his return to Sydney Marsden was disqualified for life.

### Much Crooked Riding Prevails.

A great deal of "crooked" riding is now indulged in by the Australian cracks while racing in Victoria, and few races are won on the merits of the victor. Of course the betting evil is to blame for this. Walne, Beauchamp, Jackson and Barker, four of the best riders in Australia, arrange who is to win, and this man is backed and of course a considerable sum of money is won from the bookmakers. In order to get their man home, a lot of elbowing and bumping is also indulged in by these riders. The Victorian League officials are only waiting for a

chance to suspend them for a term, but they are so clever that the chance will probably not come.

#### Washington Tax Bill Goes Over.

Washington, March 13.—Wheelmen of the national capital are rejoicing over the fact that Congress failed to enact the law imposing an annual tax on bicycles in the District of Columbia as first proposed by the chief of police, and then drafted into a bill by the District commissioners. The wheelmen vigorously opposed the enactment of legislation to tax bicycles while other vehicles remained exempt, but the matter would have been taken up and the bill very likely passed had it not been that appropriation bills and other matters of national importance commanded the attention of Congress to the end of the session. It is the general belief that the bicycle tax measure will be presented early in the next session. As the matter now stands the proposed law will not be passed unless the board of commissioners recommend it. One of the commissioners is in favor of such a law, another is bitterly opposed to it, while the third member of the board is neutral. If he can be induced to join the opposition, thus making a majority, the chances of the tax measure becoming a law will be decidedly slim.

#### Gerlach Going East Soon.

New York, March 13.—George E. Stackhouse, former secretary of the New York baseball club, was appointed a member of the national racing board of the League of American Wheelmen this afternoon by President Keenan. The appointment was announced after a meeting of the executive committee of the League. President Keenan said tonight that Fred Gerlach, the new racing board chairman, will leave Chicago for New York in a few days and will make his office either in New York or Philadelphia. During his absence from Chicago racing affairs in the west will be looked after by E. N. Hines of Detroit, who will be appointed official representative of the board.

#### League Committee Appointments.

President Keenan of the L. A. W. last Friday announced the reappointment of Otto Dorner of Milwaukee, Wis., as chairman of the committee on highway improvement. Following is the balance of the committee: H. B. Worrell, Philadelphia; A. B. Choate, Minneapolis; Dixie Hines, New York; G. Richmond Parsons, Providence; D. B. Luten, Lafayette, Ind.; Clarence W. Small, Portland, Me. The appointment of F. R. Van Valkenburg chief consul of Wisconsin, and Herbert W. Knight of Newark, N. J., completes the committee on rights and privileges. The committee on rules and regulations is entirely from the west, and consists of D. J. O'Brien of Omaha, Douglas W. Robert of St. Louis and Charles W. Lloyd of Detroit.

#### Chicago to Refund Wheel Tax.

The first act of Chicago's new comptroller after being confirmed in his new office in the council was to notify the cyclists of the city and the owners of vehicles who paid licenses to the city two years ago under the wheel-tax ordinance, that the amounts thus paid by them would be refunded upon presentation of their license certificates and tags at the city hall. The tax on bicycles for the first season was 75 cents and on other vehicles from \$1 up. The law was declared unconstitutional.

#### Philadelphia A. C. C. Shows Life.

At the annual meeting of the A. C. C. of Philadelphia last Friday night the following officers were elected to serve dur-

ing the ensuing year: Thomas Hare, Century Wheelmen, president; Madison Rush, Centaur Wheelmen, vice-president; John L. Carson, Pennsylvania Bicycle Club, treasurer; Joseph Estoclet, Quaker City Wheelmen, secretary.

Through the efforts of the A. C. C. committees the tolls on the old Lancaster pike have been reduced to one cent at each gate, which means a saving of 40 per cent. to local cyclists. A balance of \$1,776.49, with no liabilities, was reported by the treasurer. On motion it was decided to hold a fall race meet on the L. A. W. National circuit.

#### Cycle Path Activity in Ohio.

The Montgomery County Cycle Path Association of Dayton, O., has been organized for the purpose of constructing a bicycle path from Dayton to Miamisburg and eventually to connect with the proposed path between Cincinnati and Hamilton, for which purpose the West End Cinder Path Association of Cincinnati was some time ago organized. It is the dream of wheelmen of that section of Ohio to connect Cincinnati, Hamilton and Dayton by cinder cycle ways.

#### Mears to Go to Montreal.

President Keenan of the L. A. W. has appointed Chas. W. Mears of Cleveland to act as the League's representative to the annual meeting of the International Cyclists' Association to be held next August in Montreal.

#### NEWS IN BRIEF.

A \$10,000 track is to be built at Bideford, Devonshire, England, this year.

A \$16,000 cement track is being erected at Frankfort by a German bicycle firm.

One of the first events of the coming racing season in England will be a match between human and mechanical pacemaking.

Palmer, the English stayer, announces that he will go for all records from 50 to 100 miles and 50 to 100 kilometers, paced by motorcycle, this season.

Palmer, Chinn, Gascoyne and Green, with the possible addition of Platt-Betts, will be retained as a team by one of the prominent English tire firms this season.

Tom Linton has signed a new contract to race in America, but will not leave Paris until he is in perfect condition and has won a few good races or matches.

H. B. Plant, who built the Belleaire bicycle track, has a New York agent looking up track architects for the purpose of getting estimates for a cement track to be built at Havana.

There were only ninety-nine arrests in New York city last year of cyclists for riding faster than the law allows, while the previous year there were 1,127 arrests for that offense.

Few big race meets were given in Italy last year, notwithstanding the country has very good tracks. The Italian riders have plenty of places in which to train, but they lack a sufficient number of pacing machines.

The Melbourne Bicycle Club which annually promotes the Austral wheel race in Australia is reported to have \$25,000 in the treasury. The net profits of the last meet, which was held in December, amounted to \$7,500.

The Bordeaux-Paris road race is expected to be unusually interesting this year because Huret, Cordang, Rivierre and Walters have each declared their intention to win the event, and the rivalry between them is well known to be intense.

Platt-Betts, the English record breaker who was seriously injured by a collision with his pacemaking team which fell on the track in a record trial last year, says he will not follow pace any more, but will enter unpaced sprint contests.

Jimmy Michael complains that the expense of pace making for middle-distance competition and record breaking is so heavy that there is but little profit for the rider, even though he wins a number of large purses. Michael's plea shows the importance of developing motor cycle pacing for the purpose

of reducing expenses in large match races and record trials. It has been estimated that the cost of motor pacing properly carried out will be about one-fifth of that of human pacemaking.

The government of motor vehicle racing will be looked after by the English N. C. U. A clause reading, "Any cycle wholly or partially driven by any other power than that of the rider" was added to the existing description of bicycles.

The legislation and reception committee of the Toronto city council has appropriated \$300 for the purpose of giving a luncheon to the delegates to the approaching annual Good Friday convention of the Canadian Wheelmen's Association in that city.

C. W. Miller, who is now in Chicago, will do no competition riding until he goes to Paris to enter the 50-hour race to be run there next May. He hopes that after a good rest he will be in shape to come out of the race winner as he did in last year's event.

The chief of police of the department of the Seine, in which is included Paris, has notified the cycling clubs of the department that because of the frequency of accidents at the municipal track at Vincennes it has been decided to have a doctor in permanent attendance at the track during race meets.

Tom Eck has issued a challenge on behalf of John S. Johnson to race Angus McLeod, the Canadian bicycle champion, a match race, one mile, best two in three heats. The heats must be ridden inside of 1:50. The race is to be held in June for the largest purse offered in Canada and \$500 a side. McLeod said he would accept the challenge.

Permission has been granted to the South Side C. C. of Chicago by the South Park commissioners to hold its annual road race to Pullman on July 4. Owing to the opposition that has arisen to the running of road races on the boulevards of the city, some doubt was entertained as to the possibility of running the time-honored event over the historical course this year.

Harry Elkes is reported as saying that when the expense of pacemaking is taken out there is not much profit left in middle distance riding even though the rider be successful throughout a season. He further states that unless he can make some very satisfactory business arrangements beforehand for next season he will return to sprint racing and may go to Europe.

Harry Gibson has arranged match races for May with John S. Johnson, Floyd McFarland and perhaps with Elkes. All three contests will be decided on the Chester Park track, Cincinnati, the first, with Johnson, on May 30. Gibson will enter strict training early in May at Chester Park, where a number of the prominent men intend to prepare for the season.

The racing season of 1899 will be opened in Paris on March 26 by a meet at the Prince track. The manager announces that all short distance races will be run with a single pacemaker, to start a short distance ahead of the tape, after the American method. Paced races and matches will be numerous, but human pacing will be rarely seen. Whether petroleum or electric machines will be used will be decided after the first one or two meets. Motorcycle races will be a prominent feature of the season.

A contingent of six-day men have announced that they will stay in San Francisco until they receive a better reward for their services in the recent six-day race run in the Mechanics' Pavilion, claiming that money is still due them from Manager J. C. Kennedy. The riders who paced the Elkes-McFarland match are also indignant, their grounds for complaint being that though they were promised \$15 each for pacing, they received but \$5. One of them stated that had not Brady been called to New York on account of the death of his son, all of the accounts would have been squared. Another bill that Kennedy has failed to liquidate is that of the handicapper of the California Associated Cycling Clubs, which organization is very indignant.

Fournier, the Frenchman, now on the Pacific coast with his famous motor tricycle, was for years one of the best racing men not only of France, but of all Europe, and now wears upon his watch chain a heavy gold medal denoting the championship of France. Fournier has made a fortune in bicycle racing and is now a partner in a French firm representing American makers of bicycles in Paris. He has two petroleum motorcycles here with him which he is trying to introduce in the United States. Seated on his buzzing cyclone, the Frenchman scorches around the tracks without the aid of pedals, while his long brown locks stick straight out behind. When Henri trots out his demon motor tricycle and takes the inclined curves with one wheel in the air he's a terror.

## RETAIL MISCELLANY

## General Information Concerning Cycle Agents and Repairmen Throughout the Country

**Arizona.**

Dorris Brothers, of Phoenix, have dissolved. They handle furniture and bicycles.

**Arkansas.**

W. M. Graham succeeds Graham & Orr in the hardware and bicycle business at Clarendon.

J. C. Barlow has sold out his hardware business in Helena. He carried bicycles as a side line.

**California.**

The San Diego Cycle & Arms Co. has fitted up attractive salesrooms at the corner of Fourth and E streets. The company consists of F. W. Garrettson, George G. Garrettson, D. F. Garrettson, J. S. Ackerman and Frank Ecker, well-known business men. A full line of bicycles will be carried.

Bridges, Greever & Co., of Azusa, have been succeeded by H. S. Rodgers & Co. in the hardware and bicycle business.

**Canada.**

Gordon Duncan has been appointed agent in Stouffville, Ont., for the Racycle.

**Colorado.**

Bert Gartin is busy getting his bicycle shop in shape for business. He will be better prepared than ever to give his attention to repairing. He will handle Rambler and other well-known bicycles.

**Connecticut.**

The enterprising firm of Brunner & Co., 198 Pearl street, Hartford, has prepared for a larger business than ever this year. The store has been refitted throughout with handsomely tinted paper, new carpets, rugs, furniture, etc. They handle both chain and chainless models.

Harry E. Fay, the well-known bicycle rider, has opened up a bicycle repairing department in William Carr's harness shop in the Park building, Hartford.

The Mystic Bicycle Agency has opened in the Buckley block, Mystic, with a line of bicycles, including the Keating, Iver Johnson, Columbia, Monarch, Remington, Wolff, American and White. A full line of sundries is carried, and the repair shop is fitted with the latest and most modern means of repairing wheels. Souvenir spoons, china and flowers were presented to all the ladies who attended the opening, and to the gentlemen cigars were given. Nelson J. Baker is the manager of the agency.

**Delaware.**

V. V. Harrison, who was for a number of years connected with McLearn & Kendall, has taken the agency for Remington bicycles and other well known machines and has opened a store and fully equipped repair shop at 215 West Seventh street, Wilmington.

**District of Columbia.**

Doremus & Just, Washington, have dissolved partnership. They were repairers of bicycles.

**Illinois.**

The Hazard-Doubet company, of Peoria, has been granted incorporation papers. The capital stock is \$15,000. The incorporators are Samuel B. Hazard, Sylvester Doubet and Charles A. Myers. This firm will conduct an implement and bicycle business. Much of the stock is already in and more is arriving.

F. Sierp, of Aurora, has removed his repair shop to 7 North River street.

C. E. Crandall & Co. will on March 25 open a first-class bicycle livery and repair store in Dwight. They will have the best machines for sale and rent and will do all kinds of repairing on short notice.

McCarty Bros., of Mason City, have sold their stock of bicycle repair tools, etc., to B. C. Rickard. Mr. Rickard will have his bicycle repair shop in his furniture store and keep a competent man to do the work. Mr. Rickard does not intend to sell bicycles, but will keep a full stock of supplies and sundries.

J. E. Keener, who says he is a real estate man, was arrested in Chicago and charged with obtaining goods by false pretenses. Henry R. Pollow, a bicycle merchant at 238 Lake street, says that Keener, in company with another man, bought \$500 worth of bicycle tires, giving in exchange a check signed "R. E. Dent." Dent is a prominent

merchant in Des Moines, Ia. At the bank on which the check was drawn the signature was declared a forgery.

F. E. Schroeder succeeds Schroeder Bros. in the hardware and bicycle business at Warrensburg.

H. F. Olmstead & Co., Evanston, who handle bicycles as a side line, contemplate moving to Marinette, Wis.

David Fife succeeds Bussard & Fife in the bicycle and hardware business at Palestine.

Mr. Wortham has sold his interest in the firm of Wortham & Cox, who handle hardware, bicycles, etc., at Tuscola.

Arthur J. North is ready for business at his new store, 316 East State street, Rockford. Last season Mr. North started to sell bicycles at a cigar store and, despite the fact that he was in the field late, the excellence of his line gave him a fine business. He will sell Hurd, Rockford, Syrian and Halladay models.

**Indiana.**

The Meyer Cycle Co., of Fort Wayne, has branched out and recently removed from last year's quarters to 39 West Berry street. The Viking and Orient bicycles are their leaders this year. Bicycle sundries can be found at this establishment in more general variety than at any other supply house in the city. A guarantee of perfect workmanship will be given with every job turned out from the repair department.

Jack Banta, who has been engaged as salesman for the National Bicycle Mfg. Co., has finished his trip and returned to Terre Haute, where he will continue his North Sixth street bicycle agency.

L. S. Wheeler has opened up a bicycle repair business at 359 South Calhoun street, Fort Wayne.

Clark C. Tuttle, formerly salesman for the Hay & Willits Mfg. Co., of Indianapolis, has taken charge of the retail department of the H. T. Hearsey Cycle Co., 216-218 North Pennsylvania street, the oldest and largest bicycle house in that city.

A new bicycle shop will be opened at 23 North Seventh street, Terre Haute, under the management of Messrs. Jenny and Singhurst, of Chicago. They will manufacture cycles to order and will also rent and repair bicycles.

Harvey & Little, of Waynetown, have placed a bicycle repair shop in their hardware store.

Tom Hay, the well-known wheelman of Indianapolis, has opened a new bicycle store at 39 Monument place.

A large crowd was in attendance at the opening of Shirley Carrell's bicycle store in Hartford City last week. The Dayton quad attracted much attention, as well as the Columbia chainless. Mr. Carrell's store would do credit to a city several times larger than Hartford City.

Will Lamberson, of Greenfield, will shortly open up a bicycle store in the rear of his drug store, and will keep a good supply of machines.

**Indian Territory.**

Jas. K. Mulock has taken a partner in his hardware and bicycle business, and the firm name is now Smith & Mulock.

**Iowa.**

N. S. and M. H. Harter have gone into the bicycle business in the McCarthy building, Sac City, where they will sell, rent or repair.

The friends of John R. Vosburgh, the popular bicycle dealer, are welcoming his arrival home from Syracuse, where he has been passing the winter gaining additional knowledge of bicycle construction in one of the large factories in that city. Mr. Vosburgh will again conduct a bicycle business in that city during the coming season, but has not yet decided upon a store location.

Buser & Son, Cedar Rapids, have opened a store for the sale of bicycles.

P. Williams & Son have succeeded Blakestad Brothers in the hardware and bicycle business at Bode.

H. L. Traub's bicycle shop at Clinton has undergone many improvements and there is a competent workman in charge of the repair department.

The Cedar Rapids Cyclery, Des Moines, was incorporated last week by articles filed with the secretary of state by Harry K. Smith. The capital is \$10,000.

**Kentucky.**

A bicycle show was held in Owensboro for

three days. The show was under the management of W. A. Guenther & Sons, who handle several high-grade machines.

**Louisiana.**

The Abbott Cycle Co., Limited, of New Orleans, has secured an admirable space at the state fair and is the only bicycle establishment which has been allotted a position on the ground floor of the main building. R. W. Abbott, the head of the company, purposes making a handsome display of bicycles and sundries. The firm is engaged in a modest way in the manufacture of bicycles and is one of the few such concerns in New Orleans.

**Massachusetts.**

John J. Guthrie, Worcester, has hired the news room in J. S. Livermore's hall, which he is fitting up as a bicycle salesroom.

Horace Partridge & Co., Boston, makers of athletic goods, anticipate moving from their present location to the corner of Franklin and Arch streets, where they expect to have an opening about the middle of March. The firm will give its undivided attention to the sale of bicycles, sundries and athletic goods.

J. Leonard Tattersall has withdrawn from the firm of Freeman & Tattersall, the Broadway bicycle dealers and repairers of Lawrence, Mass. The business will be conducted by Mr. Freeman, as it was prior to his taking a partner.

F. E. Wing will open his bicycle store at 74 Washington street, Salem. Mr. Wing has had ten years' experience in the bicycle business. Last season he managed the bicycle department of Dame Stoddard & Kendall, of Boston. He will handle Peerless, Barnes, chain and chainless, Sager roller gear chainless, Duquesne and other makes.

Fred Harper will open a bicycle store in Salem.

H. O. Curtis has bought out the bicycle business of James B. Barnes, at Gardner. Mr. Barnes has done a good business for three years. The agency bought out is for the White bicycle only, but Mr. Curtis expects to secure other agencies.

**Michigan.**

Burnett Stevenson and Will Hendershott have opened a bicycle repairing store under Deery's art store, Port Huron.

Aleck Ericson has reopened his bicycle livery and repair shop in Marquette.

Mr. Holmes, of the Holmes Cycle Co., Lansing, states that their wholesale trade in Michigan and Indiana has been over four times greater so far this year than for the same period in 1898. At their formal spring opening they will display the New Fox and Climax models manufactured by the Holmes Co. and also a complete stock of Dayton and Trintly bicycles.

A bicycle opening was held at Bements retail store, Lansing. Men from the Butler Wheel Co., of Butler, Ind., and the White Sewing Machine Co., of Cleveland, O., were on hand to introduce the machines made by their respective companies.

Bert Smith is traveling in the Thumb introducing new machines before opening his bicycle store in Caro.

B. A. Isbell is reopening his bicycle store in Mount Pleasant. He will deal exclusively in bicycles this season, and has a first class repairer engaged.

Al. Guichard, of Walla Walla, who has opened a bicycle and repair shop in the Besserer building, recently received a lathe of the latest pattern.

Clint C. Allen, the bicycle manufacturer on Columbus avenue, Bay City, has placed an air tank in his shop for the use of customers.

The Huron Cycle & Electrical Co., Port Huron, has reopened its bicycle works in the Sanborn building.

C. H. Bartholomew has removed his repair shop in Tecumseh to the table factory office with Leon Rosacrans on Chicago street, and, with increased facilities, is better prepared than ever to do work in the bicycle repair line.

Gurdon Edgerton, of Holly, has moved his bicycle repairing establishment to a building recently purchased of I. W. Mitchell.

C. E. Lancaster, of Petoskey, has sold his bicycle livery to Geo. E. Mills, and will devote all his time to the bicycle repair shop.

J. Sullivan has sold out his interest of the firm of Chandler & Sullivan, Dundee.

Frank H. Wixson succeeds Gibbs Wixson in the bicycle and hardware business at Coleman.

Brown's Detroit Bicycle Exchange succeeds the Detroit Bicycle Exchange in business.

**Minnesota.**

The agency for Victory bicycles, manufactured by Hawkins & Co., has been placed in the hands of Frank Hunt, of Crookston.

C. A. Zabel, of New Paynesville, has gone out of business. Hardware and bicycles were the goods handled.

**Mississippi.**

J. W. Hooze of Jackson, Miss., has consolidated with the Jackson Cycle Co., of the

same place. A complete stock of everything requisite to a first class and strictly up-to-date bicycle establishment will be kept on hand.

#### Missouri.

Bradley, Alderson & Co. succeeded the firm of Bradley, Wheeler Co., Kansas City.

Louis Riggs succeeds the firm of Louis Riggs & Co., dealers in hardware and bicycles at Kennett.

James E. Hart will succeed the firm of Hart & Sailor in the hardware and bicycle business at Montgomery City.

#### Montana.

Rodgers & Co. succeed Sam Crockett in the bicycle business at Bozeman.

#### Nebraska.

Jeff. Van Debergh & Son have sold out their bicycle and hardware business at Talmage.

#### New Hampshire.

The Laconia Hardware Co., Laconia, has burned out. They handled bicycles as a side line.

#### New York.

Jacob Seigel is talking very strongly of putting up a bicycle repair shop on Main street, Hornellsville.

H. F. Flint, of Clifton Springs, has concluded to open bicycle stores in both Phelps and Shortsville as well as Clifton Springs.

Peter W. Sitterly will soon go into the bicycle and repairing business in Ponda.

Jno. F. Shaughnessy will succeed the firm of Shaughnessy Brothers in the hardware and bicycle business at Utica.

#### New Jersey.

Chas. S. Taylor, of New Monmouth, has started in the bicycle business.

The firm name of James Sweeten & Son, Pedrickstown, who carry bicycles as a side line, has been changed to James Sweeten's Sons.

#### North Dakota.

James Coulter, of Grand Forks, will use a part of the Carter confectionery store for a bicycle shop.

The Fargo Typewriter Exchange succeeds R. E. Young Co. in the bicycle sundry business at Fargo.

#### Ohio.

Clyde McKee and W. A. Thomas have leased a portion of the old rink on East Market street, Warren, and will engage in the bicycle business.

F. E. Low, Steubenville, has reopened his bicycle repair shop.

Will Ludwig, of Bellaire, has removed his bicycle repair shop from opposite the park to the Gorby building.

J. B. Clark & Co. is the name of a new firm which will handle bicycles, bicycle sundries and conduct a repair shop in Jefferson.

J. M. Lakin & Co. succeed Jas. Martin & Co. at Manchester. The goods handled are hardware and bicycles.

Charles H. Krug, of Dayton, has brought suit against Edward Boderwisch, in which he asks the court to dissolve the partnership of the bicycle firm of Boderwisch & Krug and makes a motion to have a receiver appointed to take possession of the property and collect outstanding debts. He claims that they have been losing money and that he is unable to agree with his partner. Plaintiff places the assets at \$800 and liabilities at \$225.

#### Pennsylvania.

The Jersey Shore Cycle Co., of which Mr. John C. Irvin was manager, has changed hands. It will hereafter be managed by B. F. Nurnett and known as the Jersey Shore Cycle Co., Limited.

William Harris will open a bicycle store and repair shop at Montoursville.

Snyder & McFall have opened a bicycle store on South Beaver street, York City, for the sale of Columbia and Hartford bicycles. They have also equipped a complete repair shop. Mr. Snyder is a well known and experienced repairman.

The Enterprise Mfg. Co. is the name of a new concern that has gone into the bicycle business at 25 West Seventh street, Erie. The company will build and repair bicycles.

W. A. Stouck has opened up a bicycle store at 219 West Fourth street, Williamsport, where he will handle the Demorest bicycle, a full line of bicycle repairs, etc.

Frank R. Calder, a bicycle dealer of Harrisburg, has gone out of business.

J. Wesley Johnson, of Philadelphia, has gone out of the bicycle business.

#### Rhode Island.

E. R. Darling, of Woonsocket, dealer in bicycles, etc., has installed a new four horse power gas engine made in Garrett, Ind., at

a cost of about one cent an hour when in use. Mr. Darling contemplates lighting his store with electricity, the plant necessary to be run by the gas engine.

#### South Carolina.

C. D. Nesbitt has sold his interest in the firm of Nesbitt, Trowbridge & Co., Piedmont. They carry bicycles as a side line.

#### South Dakota.

W. S. Piggott succeeds Cuppett & Alexander in the jewelry and bicycle business at Hudson.

Schneider Brothers Co. succeeds the firm of L. V. Schneider & Brothers at Salem. They handle bicycles as a side line.

#### Tennessee.

E. A. Banfield and J. W. Clouse, two young men from Toledo, will open a bicycle store in Chattanooga in a few days. Both are experienced in the bicycle business.

#### Texas.

The West Texas Supply Co., Seymour, succeeds the firm of Finn, Fowlkrs & Co. They sell hardware and bicycles.

#### Wisconsin.

Claude Shepard will open a bicycle store in Rhinelander the coming summer.

Frank Trist has opened a bicycle and repair shop at 1507 West Sixth street, Racine. He will keep a full line of supplies and sundries.

The Kolsch Hdw. Co., Menasha, has added bicycle enameling to its bicycle repair shop. George DeWolf has charge of the work.

Earl Van Vliet will open a bicycle repair shop at 917 State street, Racine. He will carry a full line of bicycles and supplies and also have machines for rent.

Emery Reed has opened a bicycle repair shop in Elkhorn.

A. H. Johnson will open a bicycle livery in Rhinelander. He will handle Stearns bicycles.

The A. J. Lucla Bicycle Co. will soon open their bicycle emporium and repair shop in the Flatley building, Adams street, Green Bay.

Mueller & Mann are making a number of improvements in their store on Fine street, Green Bay. In the future the second floor will be used as a store room for bicycles.

L. W. King, of La Crosse, has taken the retail bicycle agency of the J. S. Medary Saddlery Co.

### BORROWING TO CLAIM DISCOUNTS

Important Source of Profit Frequently Neglected—  
Advantages of Borrowing from Banks.

It is frequently discovered that a merchant, while progressive in most matters, still fails to perceive the profits to be made from discounts. Some time ago a customer of a certain house was found to be very tardy in his payments. Investigation of his statements made to the commercial agencies showed that he was in good financial condition, having a surplus of some \$20,000 over all indebtedness. He carried a stock of about \$10,000. His annual sales were about \$30,000, which would indicate that he turned his stock three times a year. In other words, with a capital in use of only \$10,000 he was doing a business three times that volume in amount. This is an important fact to bear in mind. It was found further, upon investigation, that this merchant, in common with many others, had gained the idea that he could place his money in outside investments to better advantage than would follow from using it in his business.

In some lines of goods which he carried he received a discount of 6 percent on bills paid in ten days. In other lines the discounts varied, grading down to 2 percent for the minimum. The average discount allowed for prompt settlement was 4 percent. It was soon made clear that, inasmuch as the capital employed, say \$10,000, was used for purchases three times a year, and each time by claiming discounts was entitled to 4 percent, it was possible to make a profit of 12 percent per annum upon the investment through this means alone. The merchant at once perceived that a yearly income of \$1,200 upon a capital of \$10,000 is a much better return than he could expect from any out-

side operations that are absolutely safe. Such a return for prompt payments will go far toward making any business an unqualified success.

The question arises in many cases how to take advantage of discounts when ready cash is not at hand. This, however, is a problem of no very great difficulty, provided the business is in good condition and shows by the relation of live assets to liabilities that the merchant is entirely solvent and in possession of a reasonable surplus. Money is plentiful in the banks, and bankers are always ready to lend a responsible borrower. The rate of discount at which money can be secured from the bank is rarely above 6 percent per annum. Accordingly, the merchant who occasionally borrows from his bank for the purpose of claiming discounts which net him 12 percent per annum is enabled to make a clear profit of 6 percent upon the transactions. Or where he borrows for all his payments, with a business of the size mentioned above, there is still a gain of \$600 in discounts.

These facts clearly show that every merchant who does not arrange to discount his purchases is neglecting a very important source of profit.

### Advertising Cheap Machines.

Did you ever remark how much easier it is to write advertisements intended to help the sale of cheap machines than it is to prepare announcements which will arrest the attention of those who may be expected to have a lurking fondness for high priced goods? Just notice how smoothly the following advertisements, prepared by a Harrisburg dealer, read, how forceful they are in expression, how adroitly they are worded:

## Bicycle Talks

FRIDAY, March 3rd, 1899.

Good Bicycles at \$16.50 are not plenty; never will be any where but here. \$25 to \$75 will be the range of prices for wheels this year—nobody thinks of paying less or more than these sums.

Here's where I get my fine work in; right at the very beginning of the season, I am selling good, all 'round wheels—wheels and tires guaranteed; and both equally as good as to be had in any \$35 wheel on the market—500 of them for \$16.50 each!

\$5 more; or for \$21.50 I give you a wheel that is better—every way better than most \$50 wheels. Come and look at the wheels, take them apart—see for yourself. I want you to do that before you buy them.

Salesroom—4 S. Market Square.

John N. McCulloch.

## Bicycle Talks

SATURDAY, March 4th, 1899.

Paying a big price for a wheel is like riding down town in a cab when you could go in a car. Looks more elegant, to be sure—costs more, too.

All right if you can afford it. For all practical purposes the bicycles I am selling for \$16.50 are as good as any.

They'll ride as easy and carry you as far as the average \$50 wheel—not so fancy, perhaps, but just as much wear.

I guarantee every part of these wheels and the tires and will make good any thing that proves defective in material or making. 500 wheels; men's and women's models at \$16.50 each. See them. Salesroom, 4 S. Market Square.

John N. McCulloch.

**M**ARY had a little lamb  
 With white and fuzzy wool,  
 He wore a cow-bell 'round his neck  
 And tagged the girl to school.

The jangling of that awful bell  
 Made such unearthly noise,  
 The teacher could not teach her class  
 Of little girls and boys.

Peerless, No. 80

What did that clever schoolma'am do?  
 She bought a PEERLESS bell  
 And hung it 'round the lambkin's neck  
 And strange it is to tell—

But now they love to hear the lamb  
 Come tinkling into school,  
 The bell makes such sweet music,  
 (That schoolma'am was no fool!)

# Trouble-less Transfers

What is the use of having a hand-stripe artist in every village, when the best of them who are employed by large manufacturers and only for special work, cannot compete in beauty of design and fineness of execution with our transfer work at one-tenth cost?

We are the centralized Decoration Artists of the Cycle Trade. Our high-paid artists put consummate skill and talent into designing and color distribution. The rest is automatic. The hand striper makes blunders at every turn. He is not automatic.

**Enamellers, Cycle Retail Dealers and Jobbers—Write us for full information, samples, trial designs, directions for use, electros, etc.**

N. B.—Remember stock designs in lots of fifty, especially intended for cycle agents.

# INFORMATION FOR BUYERS

## JOCKEY CYCLOMETER AND CYCLE WATCH.

The New England Watch Co., of Waterbury, Conn., claims that a cyclometer which can be reset and changed at will does not keep accurate records and hence in making its Jockey cyclometer it uses a geared mechanism every part of which is locked in position and is only released as it comes into action and cannot be moved except by revolving the wheel. The cyclometer thus cannot be reset and it is practically impossible for the figures to jump or be falsified. The action is direct, there being no springs or eccentrics. No oiling is required. The register continues to 10,000 miles, when the cyclometer instantly returns to zero and repeats. The parts are rust proof and the casing is rain-tight. The cyclometer is made for 26,

28 or 30 inch wheels. The company also makes the Jockey bicycle watch, which has a genuine four-jeweled watch movement with duplex escapement. It fastens to the handle bar by a light, secure holder and is not affected by jars and jolts. It winds and sets from the stem and both can be readily done without removing the watch from the holder. The construction of the holder imparts a spring action to the watch which prevents all rattling.

## SAFE SUNDRIES FOR DEALERS.

Special efforts are being made to acquaint the dealers with the virtue of Cole's Tire Fluid which has been added to G. W. Cole & Co.'s line of bicycle specialties, the other principal compounds of which are the familiar "3 to 1" lubricating oil, R. R. rust remover and nickel polish, and Pacemaker chain lubricant. The tire fluid is a puncture curing compound which is put up in four-ounce collapsible tubes having threaded nozzles which screw directly on to the valve. Thus no pump is required for forcing the fluid into the tire, and a thoroughly clean and agreeable method of injecting the compound without soiling the hands or anything else is furnished. For the purpose of thoroughly and effectively introducing this sundry, the makers, G. W. Cole & Co., 111 Broadway, New York city, are making a special offer elsewhere in this issue to send one full sized sample tube of the tire fluid weighing four ounces to any dealer or repairman upon application accompanied by 10 cents to pay expressage.

Notice has been sent to every jobber of cycles and cycle sundries in the United States by G. W. Cole & Co. of New York city that every jobber cataloguing their tire fluids would be indemnified against loss and protected against suit for infringement of patent on the puncture closing compound. The announcement was called forth because of the action of certain parties, who made it a point, according to Cole & Co., to procure jobbers' catalogues, and if they discovered any other puncture healing compound but their own advertised therein to notify the jobbers that they held the only valid patent and would hold all infringers liable.

Cole & Co. went into the tire fluid business innocently, having no knowledge of any patents, as various compounds had been on the market for years. They are making and selling a tire fluid and state that, having secured the advice of their attorneys, they will defend themselves and their customers against any action brought by others claiming infringement.

## ALL KINDS OF RIMS.

The Fairbanks-Boston Rim Co. of Bradford, Pa., manufactures so extensively that it is impossible to list and describe all of its various styles and sizes of rims. Its line of laminated rims ranges in sizes for tires from 10x1 inch to 38x4 inches, and in this class of rim the company furnishes rims suited to any purpose to which a suspension spoke wheel is adapted.

Its line of single-piece rims does not comprise so great a variety as the laminated, it having been found impossible to produce satisfactory rims for all purposes in the one-piece pattern. Some of the rims furnished by this company have been used for motor vehicles weighing nearly 2,000 pounds and

carrying tires 4 inches in cross section. The company also owns the patents covering, and is now engaged in manufacturing the aluminum lined rims for Continental and Dunlop tires.

Counting the total number of styles of rims made by this company and multiplying by the various sizes in each style, the various purposes for which the different sizes are designed and the entire list of standard rims which it is equipped to furnish, the aggregate amounts to almost 3,000 specifications. The accompanying cut shows four of the various sizes. Other sizes are figured by the company's expert to withstand the strains to which the rim may be subjected, the weight it is to carry, and the style of tire it is to be fitted to.

## HARTLEY & GRAHAM'S SUNDRY STOCK.

An extensive line of standard cycle sundries and supplies is catalogued by Hartley & Graham, 313 Broadway, N. Y., and though the goods shown constitute one of the largest jobbers' lists in the east the firm has taken care not to catalogue anything which it does not actually have on its shelves. Hence orders placed with Hartley & Graham are sure to be filled quickly. The firm aims to sell only products of standard manufacture, desiring to have its patrons feel that they are buying reliable goods from a responsible house. The following list of firms for which Hartley & Graham are exclusive export and metropolitan distributing agents is ample proof of this: Bridgeport Gun Implement Co., pedals; Wheeler Saddle Co., saddles; Bevin Bros. Manufacturing Co., bells; National Cement & Rubber Manufacturing Co., cements, etc.; Coe Manufacturing Co., toe clips and coasters; Matthews & Willard Manufacturing Co., lamps; Badger Brass Co., lamps; Claus Handle Bar Co., handle bars; J. B. Young, sprocket rims; Whaley-Dwyer Co., stirrup toe clips; New England Cycle Supply Co., shop tools; Bristol Bell Co., bells; P. W. Tillinghast, vulcanizers; Morgan & Wright, tires, and the Morse Chain Co., chains.

## FRONT FORK SPREADER.

Repairmen and riders have had frequent trouble in the past when removing and replacing front wheels on account of the decided inward spring of the fork blades. The A. J. Kapp Sons' Ivory Co., 114 East Fourteenth street, New York city, is marketing a small appliance called an expansion jack which relieves the person handling the machine of the work of pulling apart the fork sides so that the wheel may be readily slipped in or out of place. It comprises a hardwood turn-buckle on the outer end of each bolt section of which is a segmental socket that matches the sectional contour

of the fork blade. When it is desired to remove the front wheel the expansion jack is placed between the fork sides about four inches above the hub and the central nut turned until the forks have opened sufficiently to allow the wheel to easily slip from the forks. In replacing the wheel the operation is repeated. The socket faces of the jack ends are covered with felt to prevent the appliance from marring the enamel on the forks. The jack is made in two forms, one being longer than the other and intended for use in wide forks. In the wide pattern the central nut has two axial pro-

jections, to one of which the end socket is revolvably secured and in the other of which a tapped hole is provided, into which screws the threaded extension from the socket on that side. The nut in the narrow pattern is provided with a threaded axial shank on each side, these shanks screwing into the clamping sockets. The jacks are made of box wood and are well finished and strong. Selling at a very reasonable figure, they ought without much difficulty to find their way into the majority of repair shops.

## BRIDGED ARCH CROWN.

The accompanying illustration shows the new forged fork crown made by the Indianapolis Drop Forging Co. of Indianapolis.

The crown combines the strong features of the double plate and arch crowns and is a novelty in front fork crown design. The distance between the two arches of the bridge permits large brazing surface for the forkstem and braces the latter in the same manner as did the once popular flat double plate crown. The company is ready to furnish the crowns either machined or in the rough forgings and will be glad to figure on the special requirements of manufacturers.

## HANDLES ENGLISH STEEL TUBING.

The catalogue of John S. Leng's Son Co., 4 Fletcher street, New York city, is one of the most complete lists of bicycle material, sundries and tools recently issued. Nearly 200 pages are filled with illustrations, brief specifications and prices of standard goods of all description. Complete bicycles are also catalogued, the machines being those which comprise the line of the Snell Cycle Fittings Co. The company acts as American agent for the Weldless Steel Tube Co., of Birmingham, Eng., whose tubing is kept in stock in all sizes. This brand of tubing has been manufactured for twenty-four years and is claimed to be absolutely accurate both in diameter and gauge. Though the line of sundries handled is very broad, including popular articles of many makes, a specialty is being made of the "Arc Light" acetylene gas lamp which the company is jobbing and which is attracting much favor in the east. The lamp is small and has many features which render it a very convenient gas lamp to operate. The workmanship is guaranteed to be of the highest class and the price is reasonable.

## TRUING LINES ON VIM TIRES.

Notwithstanding various rumors to the contrary, the Boston Woven Hose & Rubber Co. of Boston is still making Vim tires under the control of the assignees and trustees, and expects to continue in the business. While the factory is not running twenty-four hours a day, it is running six days a week, as many hours as the law of the state allows. Neither are any members of the company standing on the front steps and shouting to all passersby to come up and get tires for nothing, as the southern dandy gets "ligion." The business is being conducted on business principles with satisfactory results.

A simple but effective innovation in tire construction has been adopted by this concern, which now makes its Vim tires with a truing line on either side of the inner periphery, just about where the edges of the rim will come. These lines make it an easy matter for the person who cements the tire to the rim to get it on straight every time without having it twisted or lop-sided, the lines showing instantly any variation.

## ANOTHER MODEL IN THE DAYTON LINE.

The Davis Sewing Machine Co. of Dayton, O., manufacturers of the Dayton cycles, has added another model to its '99 line, which is fully described in a supplement to its catalogue, recently issued. This supplemental model is built on racing lines and has three-inch drop of the crank hanger. The Dayton two-plate fork crown, handsomely nicked,

is used. While this model is designed for racing purposes, it is adaptable to and guaranteed by the company for general use. The same options in equipment provided for any of the other models are allowed. The new model is designated as Model 22 and the list price is \$60.

**RIDERS SATISFIED WITH WOOD FRAMES.**

The M. D. Stebbins Mfg. Co. of Springfield, O., states that owners of its Chilion resilient wood frame bicycles constitute a better satisfied class of riders to-day than did its patrons during the seven years in which the company manufactured high grade bicycles with steel frames. It further states that the rigid test of use under all conditions has proven that the joints employed in the Chilion wood frame do not work loose and that the frame bars do not warp nor give trouble in any manner even under outrageous abuse. In designing and constructing Chilion bicycles the company has guarded against falling into that rut common to makers who have something distinctive to introduce, which is to neglect the general construction of the machine in developing the particular distinguishing feature. The Chilion bicycle is made by builders who have had long experience in the manufacture of steel bicycles and the entire machine is designed with that care and erected with that skill which insures high grade product.

The Chilion is offered in two standard patterns, a man's and a woman's, and each has incorporated in it popular ideas in frame lines, etc. The finish has an antique wood effect and the connections are nickel plated. The company's recently issued catalogue tells all about the claimed advantages of the wood frame and the reasons why it was adopted by the makers of Chilion bicycles.

**FEATURES OF RUSH DETACHABLE TIRE.**

The Rush detachable tire made by the Rush Tire Co., of Williamsport, Pa., was given hard tests last year and under varying conditions and on all kinds of rims, by different road riders, and the result showed that even under the most adverse circumstances the tire would not creep on the rim nor loosen in its fastening while being ridden. The molding of the rubber and the making of the fabric is such that the tendency of the rim side under air pressure is to hug the rim as closely as possible. The company is now ready to fill orders in all quantities and a profitable business is expected. Locking upon itself as it does and being designed to fit the standard crescent shape rim, the tire should be greeted favorably by advocates of double tube detachables and especially by those dealers, repairers and manufacturers who would often supply detachable tires if they could do so without changing rims. The ample lapping of the under edges of the tire casing pre-

vents pinching of the inner tube and makes the work of slipping it back into place after a repair a matter of but a second or two. The tire is said to be extremely lively and resilient.

**HALL-SHONE CO.'S SUNDRY LINE.**

The Hall-Shone Co., of Rochester, N. Y., mails its catalogue, the latest edition of which has just been published, only to dealers, agents and repair men, and is accordingly able to publish prices, terms and discounts that are intended to procure and keep trade. By fair and liberal dealing with patrons the company has made a steady growth during the last five years and now occupies fifteen times the amount of space used at the commencement of its business. The firm prides itself on its ability to keep abreast of the market and to buy from manufacturers at low net prices and thus be able to sell correspondingly low. The catalogue is so complete and shows such a large line of material, fittings and sundries that it has been found that it amply takes the place of traveling salesmen. Hence the saving in selling expenses enables the making of prices which in some instances are but little more than those paid to manufacturers by small jobbers. As a convenience to customers a complete net price list accompanies each catalogue and

the trouble of figuring out discounts on various articles is thus avoided. The firm announces that after July 1 its name will be the E. H. Hall Co., Inc.

**THE AMERICAN CYCLE "CHAIN-STALL."**

This device is self-contained and consists of a tube of pure rubber of suitable cross section to conform to the shape of the bicycle chain on four sides, completely covering the same except that a slight opening is left on the inner or working side by which means it passed by the sprocket teeth. This tube is passed over and around the chain, its ends being attached together in an exceedingly quick and simple manner, and travels with the chain continually, di-

viding in passing the sprockets, and has no attachment to any other part of the machine.

To attach or detach the "Chain-Stall" for examination or repair of the chain, it is sprung over the latter as simply as a rubber band is slipped over a package. No tools are used, the hand alone in a simple movement performing the necessary operation in a few seconds.

The device has been called the "chain-stall" by the makers because it is an attachment to the chain pure and simple as distinguished from all gear cases and chain covers which attach to the bicycle frame. It is the acme of simplicity, does not detract from the appearance of the machine, being scarcely noticeable, and weighs but four ounces. It is made by the American Cycle Chain-Stall Co., P. O. box 2525, New York city, which makes the following claims for it: That it makes the machine run easier by protecting the chain; saves wear on chain and sprockets; is simple, neat and handsome; is light, noiseless and absolutely without friction; is a complete protection to trousers or dresses, perfect in action, and costs but a trifle; that it reduces friction, saves power, improves the appearance of the machine, adds no complication, weighs practically nothing, never gets out of repair, and saves strength, temper and money.

**LUTHY "LINE OF BEAUTY" CRANKS.**

The S curved crank is still a distinctive feature of the Luthy bicycle, manufactured by Luthy & Co., of Peoria, Ill. These cranks together with the outside fishmouth nicked joints which have characterized the Luthy for some time have proven so popular and have gained such a reputation for the machine that the makers see no reason for discontinuing them, especially when their mechanical worth has been long since demonstrated to the satisfaction of Luthy riders. While Luthy & Co. do not hire racing men nor in any way stand behind track teams financially, the Luthy racer is by no means a stranger to fast tracks nor to national circuit race meets, for the string of world's records made in America on Luthy bicycles is large and includes both short and middle distance events. At the last national L. A. W. meet held in Indianapolis the Luthy carried off four of the most prominent amateur events. The company has lately issued a small booklet containing illustrations of the two leading Luthy models, lists of track records made and races won on Luthy bicycles and testimonials from satisfied Luthy owners. Besides the \$75 Luthy the company also make the Fairy King and Fairy Queen, selling at popular prices and bidding fair to be favorites in their classes.

**AGGRESSIVE REMINGTON AGENT.**

The Veru Bicycle & Rubber Co., 160 Orange street, New Haven, Conn., which has been very successful in the past in selling Remington bicycles and which enthusiastically upholds the merits of the Remington nonstretchable chain, is unwilling to abide by ordinary selling methods in the scramble for business this season. It has accordingly collected from among its numerous patrons of last year testimonials regarding the efficiency of the Remington chain and has compiled these declarations of satisfaction into a small pamphlet, which is being used to create a Remington reign in New Haven this season. Many of the persons quoted in the booklet are professors in Yale college.

**FIND FAVOR IN CACTUS COUNTRY.**

The Milwaukee Patent Puncture-Proof Tire Co. of Milwaukee states that the demand for its non-puncturable tires is increasing and exceeds its expectations. The tires have been thoroughly tested in Mexico and Texas, where riders are troubled with cactus and

orange thorns. The tests have been very severe and proved the great efficiency of the tires among cactus thorns. Large orders are being received from the territory named and testimonials are coming in to the makers from San Antonio and El Paso, Tex. Orders from South Africa and the Hawaiian Islands have also been received, as well as a great many inquiries from Germany, France, Russia, Sweden and other foreign countries.

**TRADING ON J. & D. REPUTATION.**

Jarvis & Daniels, makers of bicycles, sundries and sporting goods in Grand Rapids, Mich., state that they have been advised by certain legitimate jobbers that the Willis Company of Park place, New York City, is offering J. & D. leather grips at 10 cents per pair. In justice to the many large jobbers who are handling their goods exclusively and in justice to themselves, Jarvis & Daniels assert that they have never sold the Willis Company any grips whatever nor had any correspondence with the firm. Moreover, they feel very certain that the concern has none of their grips, because no one in the country has ever bought them in any quantity at the low price of 10 cents, for which the Willis Company is offering them.

**BAY STATE WOOD RIM CO. PURCHASED.**

The K. & C. Mfg. Co., which manufactures wood rims in Ayer, Mass., announces that it has purchased the plant formerly owned and operated by the Bay State Wood Rim Co. and will devote its efforts solely to the manufacture of the K. & C. lock-joint, one-piece wood rim. The factory is being rearranged and additional machinery put in, and the company will be in position to make deliveries early this month. It is intended to make these rims as perfect in finish and appearance as the joint is perfect in strength, and the company offers to put the rims in competition with any on the market. Prices will be based upon existing trade conditions.

**STEADY TRADE IN CHILDREN'S SEATS.**

The Kozy baby seat continues to meet with a growing demand and George Hilsendegen, of Detroit, who supplies it to the trade direct, expects to sell nearly 5,000 during the present year. The particular points of advantage possessed by the Kozy seat are that it is light and strong, will fit any bicycle, is readily attached and detached, inexpensive and can be retailed at a low price. It can be instantly converted into a luggage carrier by removing the dust flaps and drawing them back over the handle bar.

The trade can secure these through any of the leading jobbers, as A. G. Spalding & Bro. of New York and Chicago; Simmons Hardware Co., of St. Louis; Excelsior Sup-

ply Co., and Hibbard, Spencer, Bartlett & Co., of Chicago; Farwell, Ozmon, Kirk & Co., of Minneapolis, and Shone-Hanna Co., of Rochester.

**FIBRE-BUCKSKIN MAILING CASES.**

Large quantities of mailing cases such as are used for sending liquids through the mail are being manufactured from fibre-buckskin by the Bascarman Manufacturing Co., of Malden, Mass., which produces the well known fibre-buckskin bicycle grip. The absorbent feature of the material has been so well brought out that it seems to be particularly adapted for packages of this sort. A letter from the postoffice authorities of a very complimentary nature led the company to make some of these cases up for the trade. They are very much lighter and stronger than anything now in use, so that they cost the purchaser less in the matter of postage, and at the same time they serve the government better in preventing all risk of the liquid going through the mail matter in case of leakage of the inner receptacle.

**NEW HANDLE BAR AND SEAT POST CO.**

The League Specialty Mfg. Co. has been organized by Arthur J. Keating, John Collins and J. C. Church of Chicago to begin

the manufacture of handle bars and seat posts at 215 South Clinton street. Offices will be located at 84 LaSalle street, Chicago, and Monroe Mitchell will act as general sales agent.

#### POPE TIRE TESTING MACHINE.

Almost the first result of scientific study of the resistance of a bicycle was the revelation of the supreme importance of the tire. Racing men and some manufacturers had known for years that there was much difference between a "fast" tire and one which "dragged," yet few realized how great a part of the total resistance was that due to the constant flexure of the materials of the pneumatic tire.

One well known professor conducted an elaborate series of tests and published some surprising statements before discovering that the difference in tire resistances, due to variations in construction and in degree of inflation, were so great as to render quite worthless his conclusions as to the relative merits of different forms of driving mechanism.

Of course any good dynamometer may be used for testing tires. The Pope Mfg. Co., however, has designed and for some time had in use a novel dynamometer specially adapted to this work.

In principle it is simply a large Atwood machine. A weight, which in practice varies from 225 to 350 pounds, suspended by piano wire, descends about 60 feet, unwinding from a drum like a clock weight. The motion of the drum is communicated by a spur gear to the crank shaft of a bicycle. The bicycle has a prescribed load on the saddle and its rear wheel rests on the rim of a light pulley called the track pulley, which it rotates. This pulley in turn, by a spur gear and drum, winds up a weight of from 50 to 150 pounds, as may be found desirable.

The accompanying drawing gives a clear idea of the working parts, though no at-

tempt has been made to indicate, except in a general way, the relative sizes of the toothed wheels and the drums. A is the driving drum, W the driving weight, B the driven drum, w the weight that is raised by the bicycle, C the track pulley, S the saddle load.

In order to steady the mechanism and to secure substantially uniform velocity as soon as possible after starting, fans were inserted between the spokes of the track pulley. The parts are so proportioned that the bicycle, if of 70 gear or higher, may be allowed to run one mile. The operator simply notes, with a stop watch, the time required for this run.

The dynamometer has given great satisfaction in comparative work. It "checks" itself admirably and seems never to get out of order. All the shafts run on ball bearings and the work done by the bearings of the bicycle itself is so slight, owing to the small load wound up, that the resistance overcome is little except that of the tire and that of the fans. Its sensitiveness is very great, the times for the run of a mile with different tires recently tested having varied from 2 minutes 23 seconds to 21 minutes 29 seconds.

As showing the reliability of the instrument, the records of the performance of a single standard tire, given a run every morning for a week, may be of interest. They were as follows: 2:12, 2:12, 2:13, 2:12, 2:14, 2:12. Twelve days afterward, the work having been meanwhile discontinued, the standard tire was tried again and ran its mile in 2:14.

#### SUCCESSFUL OPENING DAY IN MONTREAL.

R. & W. Kerr of Montreal, Can., dealers in bicycles and sporting goods and Montreal agents for Cleveland bicycles, held an opening day at their store March 4. The store room was handsomely decorated and many attractions were arranged to obtain the good will of visitors. The firm reports that

it was one of the most successful opening days ever held in Montreal, a great amount of interest having been displayed in the goods shown.

#### FEATHERSTONE DOUBLE EXPANDER.

A patent was last week granted to Anthony Jerome of Chicago on an expander which accomplishes a double purpose. It not only binds the handle bar stem within the fork stem, but secures the handle bar to its stem. By this construction the bar is made readily reversible. The stem is split and provided with a taper seat at each end

and the expander drawbolt carries an expanding shoe at each end, the bolt passing clear through the upper expansion shoe and being provided with a squared end for the reception of a wrench. An annular flange around the bolt just below the counterbore at the upper end of the stem prevents the bolt from rising when being turned in the releasing direction and thus causes the lower expander to automatically loosen from its binding position in the taper seat. The threadings in the upper and lower expander are of course rights and lefts so that the two will be drawn down into binding positions together. The expander patent is assigned to A. Featherstone & Co. of Chicago.

#### THREE VEEDER CYCLOMETERS.

The Veeder was the first small barrel-shaped cyclometer extensively marketed and in the three years that it has been before the public its maker, the Veeder Mfg. Co. of Hartford, Conn., has, it states, profited by the sale of more than 500,000 of the little distance recorders. The Veeder is now made in three patterns. The first is the regular 10,000 mile, one ounce cyclometer which is known everywhere. The second is a 10,000-mile repeating cyclometer with 100-mile trip attachment, and the third is a 10,000-mile pattern similar to the regular model but gold plated and engraved and furnished in an individual satin lined leatherette case. It is a handsome present and is suitable for those riders who desire their bicycles and equipments to be more than ordinarily attractive. The Veeder catalogue contains an illustrated list of parts and serves the dual purpose of demonstrating the simplicity of the little instruments and furnishing a guide for parties ordering duplicate parts.

#### THE NEW NATIONAL HUB.

The new hub fitted to all bicycles made by the National Cycle Manufacturing Co., of Bay City, Mich., has an extremely wide spread to the bearings and is composed of the fewest possible number of parts. The cones have broad, flat backs that fit flat against the inner faces of the fork ends. The barrel ends and ball cups are thus brought quite close to the forks, giving more space than is usual between the rows of balls. The seats into which the cups are pressed are accurately machined so that the cups may align properly with each other.

Liability of the cones tilting on the axle and thus causing the bearings to bind is greatly reduced by the broad binding surface of the cone faces against the fork sides. The locking of the bearings is also made quite secure by this construction of the cones.

#### WANTS TRADE LITERATURE.

The Cleveland Cycle Co. has been formed in Los Angeles, Cal., with headquarters at 332 South Main street, for the purpose of doing a wholesale and retail business in bicycles and cycle sundries and accessories. The company would like to get into communication with eastern manufacturers.

The firm consists of R. C. Lennie, well known the country over as representative for Morgan & Wright for five years, and J. A. Ostendorf, who has been connected with H. A. Lozier & Co. in San Francisco for five years and was manager of the Lozier branch house there for three years. The new company will make the Cleveland bicycles its leaders in Los Angeles.

#### PIERCE & CO. OPEN NEW BRANCH STORE.

Another of the leading manufacturers of bicycles has opened a branch store in Forty-second street, New York city, just west of the Grand Central depot. This latest addition to the new "bicycle row" is Geo. N. Pierce & Co., Buffalo, which is now displaying the Pierce bicycles prominently to the gaze of commuters and the volume of other travel along the well trodden pavement between the railroad quarter and the west side elevated and surface roads.

On Saturday afternoon the new store had its formal opening, with E. B. Ryder of the Pierce forces in charge of the ceremony. Invitations had been sent out to a large number of riders, and the establishment was crowded during both the afternoon and evening hours. The prominence of the location and handsome fittings and many models of bicycles displayed were favorably commented on.

The other cycle stores along Forty-second street have already had their openings, more or less formal, and the selling season in that locality may be regarded as fairly under way.

#### THE BERKEY EXPANDER.

In last week's issue of this paper an illustration of the Berkey Expander was shown without the split in the tube which permits the wedge-piece or tongue to expand it against the seat mast or handlebar stem. The error is corrected in the accompanying illustration. The expander is marketed not by Berkey & Gay as stated but by the Berkey Spring Seat Post company of Grand Rapids, Mich. It is manufactured in sizes rang-

ing from 3/4-inch inside and 7/8-inch outside dimensions to 1-inch inside and 1 1/8-inch outside.

#### RECORD BREAKER FOR MILWAUKEE MFG. CO.

The principal difference between the old machines and the latest improved models of bicycles made by the Milwaukee Mfg. Co. of North Milwaukee, Wis., is the doing away with flush joints and the change in the two-piece hanger, whereby the hexagon lock nut is dispensed with. This improvement has been thoroughly tested by the company's men in actual road use during the entire past riding season, and the makers guarantee its effectiveness. There are no complicated parts and nothing to get out of order, thereby causing the jobber and manufacturer trouble.

The Milwaukee Mfg. Co. finds the demand for its machines beyond its expectations. The plant is being operated with a full force of 300 men and is running full time and until 9 o'clock four nights each week, yet the company is still behind on deliveries. During December, January and February 14,000 bicycles were shipped, and the company is averaging 275 per day in March. Numerous inquiries for bicycles are being received every day and the company states that it looks as if this year is going to be a record breaker.

#### ARNSTEIN SECURES MALCOM'S SERVICES.

Robert Malcom, secretary and treasurer of the Chicago Cycle Supply Jobbers' Association, has severed his relation with the Excelsior Supply Co. and will hereafter be connected with the bicycle department of Eugene Arnstein, 86 West Lake street, Chicago.

#### CONFINES ITS LINES TO SUNDRIES.

Clark, Horrocks & Co., of Utica, N. Y., have just issued an extensive bicycle sundries catalogue. In selecting its lines of stock the firm has endeavored to cover the sundry field broadly, and in order to be able

MANUFACTURER OF

BICYCLES

# At Times...

it is hard for a man to think of just what he wants. At other times he knows what he wants but can't think where he can get it. Between times he uses a substitute that does for the time being but in the end doesn't pay. Our catalogue does the thinking for you and our facilities supply you on call with

## Everything for Bicycle Builders and Dealers

### EXCELSIOR SUPPLY CO.

ESTABLISHED 1876.

88 and 90 Lake St., CHICAGO.

at all times to supply dealers and repairmen with desired articles of this character the company has excluded parts and fittings for building bicycles from the list of goods catalogued and handled. The sundries listed include both high and moderate priced standard articles. Dealers writing to the company for sundry catalogues should specify catalogue IIB, which is accompanied by a separate circular giving dealers' discounts.

**BRASS LINED CYCLE TUBING.**

The Wilmot & Hobbs Mfg. Co., of Bridgeport, Conn., has found that a brass lining within cycle tubing greatly assists in securing a perfect braze between tubes and connecting lugs, especially for flush joint work. They are now making brass lined fifty carbon and also nickel steel tubing of the Clincher kind as well as brass lined rear forks, rear stays, front forks, head tubes, loop tubes, etc., and are in receipt of flattering testimonials from leading manufacturers in regard to the advantages of the brass lining. It is stated that the brass coating which is so thin that it does not add materially to the weight of the tubing, prevents frames from rusting from within and thereby losing strength, and that the enamel is not liable to peel off on frames made from this tubing. All Clincher tubing is thoroughly polished exteriorly, presenting a fine surface for enameling work. The company, however, also sells seamless tubing with brass lining in order to demonstrate to all the advantages of this new feature. The brass lining is produced by dip brazing, a process which the Wilmot & Hobbs company claims to have brought to a higher degree of perfection than any other concern, and this manner of producing the deposit adds a density to the brass which could not be obtained from electric plating. The firm will send samples of any style of brass lined tubing to manufacturers who desire to satisfy themselves of its merits. The brass lined is said to be especially well adapted for manufacturers who employ the dip brazing process.

**IDEAL BARS FINELY FINISHED.**

Success in securing contracts for the bulk of its output and the necessity of working night and day on orders has not caused the Ideal Plating Work Co., 3 Appleton street, Boston, Mass., to slight the workmanship and finish on its large line of well known Ideal adjustable handle bars. At the present time the company has sold nearly two-thirds of its output and expects to turn out more than twice as many bars this year as in previous years. The factory is running two shifts of men, yet better work than ever before is being put on the product. All bars are given a heavy copper plate and are then scratch brushed and heavily nicked, making them what the company claims to be the finest finished bars in the market.

**CYCLE SUPPLY CO.'S SUNDRIES.**

The policy of the Cycle Supply Co. of Hartford, Conn., is not to quote in its catalogue job lot or bankrupt stock prices on standard goods, but to list articles of recognized merit at prices which include cost and a moderate margin of profit. Hartford sundries have been sold for six years with increasing popularity and the firm's old watchword of "Good goods at fair prices," will be adhered to in the future. The catalogue is neatly compiled, and printed, being free from long used and poorly executed cuts and from close crowding of reading matter and illustrations. The line of sundries handled is supplemented by a carefully selected stock of parts, fittings and supplies.

**BAILEY AUTOMATIC BRAKE PATENTED.**

Herbert L. Bailey of Chicago has been granted a patent on improvements in the automatic rear tire brake manufactured by the Bailey Manufacturing Co., also of Chicago. The Bailey brake is of the spoon pattern and operates by means of a roller, which is raised by the lifting of the under side of the chain in back pedaling. The improvements in this patent relate to means for automatically maintaining the spoon in its proper normal relation to the tire and the roller in its correct relation to the bicycle chain.

**HORSELESS AGE NOW A WEEKLY.**

The Horseless Age, whose offices are located in the American Tract Society building, New York city, was established in 1895 and is the first motor vehicle journal published in the English language. It was formerly a monthly journal but has just been changed by its publishers to a weekly. This change is not only a pleasing indication of prosperity for the Horseless Age, but shows as well the rapidly increasing interest in automobiles in the United States.

**TOO BUSY TO DO ANY "SHOUTING."**

The Indianapolis Chain and Stamping Co. of Indianapolis does very little talking for publication. This year has seen no change

in this policy and the company states that it has been too busy to do any "shouting," and is glad to report that it has sawed a large quantity of wood. From present indications it anticipates that this will be the banner year in the trade, so far, at least, as the manufacture of chains by the Indianapolis company is concerned.

**HAS BEEN "SAWING WOOD" VIGOROUSLY.**

Such a heavy demand for both single piece and Dunlop laminated rims has been made upon the Olds Wagon Works of Fort Wayne, Ind., that the company has literally been "sawing wood" this winter instead of making a lot of noise to attract attention. It has produced large quantities of strips and finished rims. It is such quiet activity as this that verifies the dealers' predictions of a large trade this season.

**BUSY ON CROWNS AND EXPANDERS.**

The two articles which are just now most in demand among the large list of specialties made by the Racine Malleable & Wrought Iron Co. of Racine, Wis., are its fork crowns and expanders. Orders for these are coming in very fast at present. The company's new works are running full time on these and on seat post clusters, frame connections, hangers, etc.

**WANTS AGENCY FOR GOOD SUNDRIES.**

The Coe Mfg. Co., 50 Warren street, New York city, is desirous of adding to its well known brand of "Round Edge" toe clips, coasters, etc., a number of good selling sundries as sidelines. Among the eastern agencies now held by this concern are those of the Whaley-Dwyer Co. of St. Paul; James E. Plew of Chicago, and the Mossberg tire bells for the entire United States.

**HANDSOME FRONTENAC RETAIL STORE.**

Frontenac progress is in evidence throughout the country, but perhaps more particularly in Syracuse, where the makers of "bicycles that are built right" have recently opened one of the prettiest retail cycle stores seen in many a day. This retail sales-room is in charge of George Potter, one of the most popular bicycle salesmen in central and northern New York.

**USES NON-LEAKING VALVES.**

One of the most obstinate problems the tire maker has to contend with is the leaky valve. Many a good tire has gone wrong because of leaky valves. The New Brunswick Rubber Co. of New Brunswick, N. J., has hit upon a new method of construction which is claimed to absolutely obviate all leakage at the valve. It is using this new method on all grades of its tires.

**BALDWIN RACING CHAINS POPULAR.**

Business for season of 1899 is much in excess of that of 1898 with the Baldwin Cycle Chain Co. of Worcester, Mass. Manufacturers have specified in advance and enabled the company to fill orders promptly. The Baldwin special racer chain in both 3-16 inch and 1-8 inch sizes has found great favor and bids fair to be very popular.

**The Salesman Was too Fresh.**

A salesman for a big Chicago concern recently called upon a firm of cycle dealers in a prosperous town in the western part of Kentucky and was not aware that the three brothers composing the firm bear a marked resemblance to each other. One of the brothers is himself a cycle salesman during the winter months. The Chicago man bragged a good deal about the business which he had done on the road and how he was making life a burden for his rivals. He chattered about the different agents whom he had persuaded to cancel orders given to other traveling men and which were eventually placed with him. To hear him tell it, one would have imagined that he was the only salesman who was earning his salary and his concern's machines were the only ones which were being sold in the state of Kentucky. All the forenoon was occupied in this sort of conversation.

In the afternoon the Chicago man called to get the order and without knowing it entered into conversation with the brother who took a turn at traveling. He was easily persuaded to grow voluble over his success with agents and the luck he had been having in causing orders to be canceled. In detail he explained how

# CYCLE AGE

Vol. XXII. No. 20.

THE CYCLE AGE OFFICE.

March 16, 1899.

## READY FOR DELIVERY!

## MODERN CYCLE REPAIRS

One Hundred and Thirty Pages and One Hundred Illustrations of All Sorts of Repairs of Cycles—A List of Its Contents.

### CHAPTER 1—Repairs, or Replacement.

First equipment of the shop. A study of economical methods. Illustrations of good and bad methods. List and cost of tools and fittings. Use of assembling jacks.

### CHAPTER 2—Wheels and Component Parts.

Purchase of spokes, sizes to buy and how to keep them. Rims; tools for spacing and drilling. Inexpensive truing jigs. To repair broken spoke holes in hubs. Nipple grips. Replacing cups and cones. To braze a split cone.

### CHAPTER 3—Frame and Forks, Brazers and Brazing.

To braze without spoiling enamel. Three ways to repair broken tube. Broken lugs, fork ends and fork stems. Dangers of twisted forks. Truing a frame. Selection of a brazer.

### CHAPTER 4—Remodeling of Frames.

Computing the cost. Cutting down frames. Changes of all sorts in singles and tandems.

### CHAPTER 5—The Crank Hanger.

Remodeling. Loose cranks. Buckled tandem sprockets. Two-piece construction.

### CHAPTER 6—The Steering Head.

Broken crown cones. A question of solder.

Fixing loose cones. Squeaking steering heads. Rust on nickel.

### CHAPTER 7—Seat Posts and Handle Bars.

Broken parts. Internal expanders. The flashing of tubing. Ways of bending bars.

### CHAPTER 8—Hints on the Art of Enameling.

Necessary equipment. Keeping of enamels. Coating and baking. Two and three color work.

### CHAPTER 9—Saddles and Pedals.

Springs and clamps. Repairing pneumatic saddles. Rattan lacing. To make pomel clip. Broken springs. Difficulties of pedal repairs and how to overcome them.

### CHAPTER 10—Building Frames from Component Parts.

Should be undertaken by men of experience only. A variety of patterns. Correct angles. Dimensions. Cheap mandrels and their uses.

### CHAPTER 11—Purchasing Parts for Special Work.

Ingenuity of great value; examples. Methods by which many parts may be made of unexpected value.

### CHAPTER 12—Experimenting With Construction.

Repairmen best suited to devise practical improvements. Value of their ideas.

### CHAPTER 13—Mechanical Power in the Shop.

Practical advantages. Cheapest forms of motors. Installation. Floor plan.

### CHAPTER 14—Miscellaneous Repairs and Suggestions.

### CHAPTER 15 Tire Repairs.

According to tire construction. Method for each kind described.

## INTERESTING FACTS

Concerning the Lists From Which the Cycle Age Is Mailed.

Mexican agents are a wide-awake lot. One in every four is a subscriber to The Cycle Age.

New York has the largest number of actual subscribers. Of 3,607 agents 20 percent are on The Cycle Age's paid list.

Michigan is second on the list although five states are ahead of her in the number of agents. Then comes Illinois, Pennsylvania and Ohio in the order named.

On March 1 there were on The Cycle Age list, 55,568 bicycle agents, of whom 36,243 were in the United States. The work of correcting and adding to the lists gives employment, all the time, to not less than three persons.

A separate record is kept of every agency. It shows the length of time the agent has been in business, what wheels and accessories he handles, his commercial agency rating, and in what, if any, other business he is engaged.

The result of all this work is that The Cycle Age places its advertisers in contact with all the agents who are up-to-date and worth cultivating.

## PRIZE FOR A PROCESS

Of Case-Hardening on a Small Scale to Beat the Cyanide Method.

The repairman needs to turn up a cone, cup or pedal spindle with fixed cup from machinery steel and to case harden it economically. He does not want to wait till he has a large lot to harden, or to lose money by heating a large case for the sake of a single piece. He is forced to use the cyanide of potassium method, which hardens only a very thin shell. He is looking for something better.

Manufacturers have no trouble. They case harden a thousand cups and cones at the same time. Suitable devices are in use by chain makers for hardening parts of chains on a revolving arrangement and edge tool makers use similar methods by which they harden the edge of saws, hatchets, plough shears, etc. A system for doing the work by electricity was recently described in The Cycle Age.

But the repairman is left in the lurch with his cyanide method.

Who has a better method?

The Cycle Age will pay \$10.00 for a description of the best method by which the repairman may harden a single piece of machinery steel economically and durably.

Any method suggested will be tested before the prize is awarded. Subsequently it will be described in The Cycle Age.

"Every bicycle dealer should take The Cycle Age as it is a business educator."—Unger, Harrmann & Co., Norristown, Pa.

# SUPPOSE

ALL OF THE ADS. IN THIS PAPER WERE PICTURES

Wouldn't you look through them every week?

If they were clever pictures wouldn't they impress you more quickly than a lot of reading matter?

Wouldn't you get better returns for your outlay if your ads. contained pictures?

If you can't afford pictures—though they don't cost much—why don't you change that copy which has been running a month or more?

Do you know that many an advertiser becomes dissatisfied with a medium solely because he doesn't use the right matter?

Everything wears out. Why do you buy a new overcoat and continue to wear that out-of-date, threadbare ad.?

It costs THE CYCLE AGE money to change ads. But we live for something beyond today. We want you to be satisfied. Then you'll come again next season.

Satisfy yourself and satisfy us by satisfying the reader that there is something new which he *must* read in the advertising pages every week.

# AN EXTRACT

"Of all the bicycles made and sent from the Chicago market the greatest bargains are those offered by the Chicago Tube Co. Their 28-inch, 30-inch and 3-crown wheels with Fauber one-piece hangers beat them all. They are up to date in design and equipment and are exceedingly highly finished, and their agents control the market with them in their respective territories."

IN ADDITION to bicycles referred to in this extract from a letter by a prominent dealer we make and sell frame sets and frames and also all material to build or to repair or to equip a bicycle, and have, for the past six years, a constantly increasing business, and are in a position to give the best for the least money. Particulars, catalogue, etc., to any address.

## CHICAGO TUBE CO.

217 East Washington St. - CHICAGO, ILLS.

he ran down the goods of every concern except his own. Then the traveling dealer disclosed his identity and read that glib young man such a lecture as he is not likely to forget in a hurry. The discomfited Chicagoan lost the order and is said to be wearing a muzzle when he roams through Kentucky.

### Old Gag in New Dress.

It is storied that an English cyclist one day last year punctured his tire near Sandringham, and found to his dismay that he was minus a repair outfit. An elderly gentleman who happened to be riding past, seeing him in distress, dismounted and placed his tool-bag at his disposal. The joyful cyclist set to work, the good Samaritan looking on, "in case," as he jocosely put it, "he should have to do a repair himself some day." The repair finished the young fellow handed his benefactor a card, and asked him when "in town" to give him a call. The other replied that he would certainly do himself the honor, and then with a quiet smile gave him his own card in return, bearing the simple inscription, "The Prince of Wales."

The Indian Cycle and General Engineering Company has contracted with the imperial government for the conveyance of mails on bicycles in British India.

It was a cyclist messenger who was sent to bring the priest to the death-bed of Felix Faure.

**CLOSING OUT SALE**—Until closed out, we shall offer the following: 600 pairs finished, flat cranks, regular thread, rights and lefts, at 20c per pair, 6 in.; 2200 pairs brazed forksides 1 1/2 in., 10c; 350 pairs brazed forksides 1 in., 10c; 4360 seat post forgings, 2c each; 630 crown forgings, 2c each; 2700 pairs upper back stay forgings, 1c each; 2200 lower adjustment forgings, 1 1/2c each. **CORTLAND CARRIAGE GOODS CO., Cortland, N. Y.**

## MISCELLANEOUS.

Advertisements under this head 5 cents per word first insertion; 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders or stamps received.

### WANTED.

**Supported By a Powerful Syndicate of Bankers, A. G. Spalding is Obtaining Options on Every Plant of Importance—Unlimited Money at Command—Will Control Foreign Markets.**

### PLEDGE FROM A. G. SPALDING.

To the Editor: Please assure your readers that the proposed bicycle alliance will have no effect on this season's prices, agency arrangements or anything else.

A. G. SPALDING.

New York, March 20.

For a week past everyone in the trade, however humble or great, has been industriously hazarding or swapping opinions concerning the substantiality and probable effects of the giant enterprise now in process of formation in New York city for the purpose of consolidating the large bicycle factories. The daily papers have let loose such a flood of misinformation concerning the subject that the Cycle Age and other trade papers—all of which were pledged to the suppression of the intelligence until this issue—are now assigned the distasteful work of tardily but correctly presenting the whole matter. These are the facts:

#### The Facts in the Case.

1. An invitation has been sent by A. G. Spalding, representing a group of New York financiers, to a majority of the important manufacturers of bicycles, asking them to submit, in confidence, proposals for the sale, for cash, of their plants and goodwills.

2. There is no truth in the story, widely circulated by the daily papers and corroborated in great measure by the *Bicycling World*, that a trust or combination of interests of all the important manufacturers of bicycles in the United States has already been consummated.

3. There is no limit to the number of concerns that will be taken in, provided they have progressive and prosperous businesses to sell at a fair cash valuation. The success of the enterprise is dependent on the ability of the promoter to secure the plants at a fair price.

4. The man at the head of the project at present is A. G. Spalding. His share of the work consists in securing the options. That done, the matter will pass into the hands of the attorneys for the financiers.

5. The attorneys are Alexander & Green, with whom is connected Col. McCook. The accountant selected to make the necessary investigations is Mr. Simpson, well known to many of the leading makers and who, at one time, undertook similar work for the cycle board of trade.

6. The statement that the necessary capital is to be underwritten by a huge New York financial institution is mere guesswork, probably growing out of the fact that Col. McCook is one of its directors.

7. The capital of the proposed combination has not been fixed. It is dependent entirely upon the amount necessary to make desirable purchases. The \$50,000,000 story is more guesswork.

8. All options and the figures accompanying them will be examined by the accountants and submitted to the syndicate of financiers, who, as usual in such cases, will make only such purchases as business prudence warrants.

9. The business head of each concern is required, as part of the bargain, to sign an agreement to retain his position for five years.

10. No agreement has been made with any manufacturer, or set of manufacturers, to purchase their business; nor is it likely that any such agreement will be made in the near future.

11. The lists printed of makers included are purely speculative. There have been many good guesses—nothing more. No list of concerns affiliated with the combination will be given out until it is certain that they will be purchased.

12. Under no circumstances will the proposed combination affect the business of any

concern participating in it, during the present season.

13. No change whatever will occur in the matter of prices, during 1899, as a result of the proposed combination.

14. The combination is not based on chainless patents. They cut no figure in the negotiations.

15. The negotiations have been in progress less than a month. Mr. Spalding's European trip had nothing to do with the matter.

16. It is not likely that the combination will be completed and prepared to take definite action as to plans of action for several months. The deal is too stupendous to be pushed through hurriedly. Hence all statements as to plans are mere surmises. Even the men who are most prominently identified with it are unable to indicate definitely any plan of action. No one will be able to talk with authority until the company has been floated, the capital subscribed and the directors, officers and committees selected.

#### Well Founded Impressions.

The Cycle Age hazards no guess on any of the questions involved, but presents herewith the gist of impressions gained from a number of persons interested:

A. There will be no change in the principals of any concern for the present and, so far as is known, none for five years.

B. The closing of factories is not contemplated; on the contrary, it is expected that outputs will be increased in view of an expected increase of foreign trade.

C. There will be no changes of agencies, or of existing arrangements, for the present.

D. The combination will not seek to antagonize or decrease the number of reputable agents.

E. The strict maintenance of advanced prices will be one of the first rules of the combination.

F. The names of well known machines will be retained and advertised as fully as heretofore.

G. It is likely that, should this effort succeed, the makers of parts and sundries will be similarly combined.

#### No Menace to Dealers Contemplated.

The authenticity of the foregoing statements is guaranteed. They indicate clearly that, no matter what the ultimate

outcome, the proposed "concentration of brains and energy" is at present in its infancy. Alarmist reports may be safely disregarded by agents for the present for three reasons: First, there is no certainty that the combination will succeed; second, the promoters offer assurance that no menace is intended to legitimate dealers; third, months must elapse before the combination takes definite shape, so that dealers will have abundant time to consider the matter in all its bearings.

The Cycle Age will present details of developments as they occur, direct from headquarters, avoiding statements which are mere guesswork.

#### Unlimited Capital at Command.

There is a practically unlimited amount of capital behind the movement. Mr. Spalding's headquarters are at the Waldorf hotel in New York city. That he has been a busy individual for a week or two past may be easily imagined. For three days, up to last Saturday night, he did not leave the hotel. He was just beginning to gather in the loose ends with a view to the completion of the first chapter of the most interesting event in the history of the cycle trade.

But wild rumors were set afloat last week. They told of a capitalization of \$50,000,000; of a proposal to kill off 80 per cent. of the agents; of a decision to close many of the factories, and of other matters equally wide of the truth. The facts are here given for the first time as a result of interviews with Mr. Spalding and a number of gentlemen associated with him in the project.

#### Talk With Mr. Spalding.

"Please do not bear too heavily on my connection with the matter," suggested Mr. Spalding. "I have been selected to undertake this work more from chance than deliberate selection.

"During the past year I have been approached at various times by different manufacturers as to the advisability of some kind of an alliance or combination being formed that would be in the general interest of the bicycle trade. These various conferences convinced me that the leading manufacturers were favorably inclined towards some kind of a business alliance on the lines of other industrial enterprises, and several urged me to take the initiative in the matter. I hesitated for some time in taking it up, hoping that it would be brought about in some other way or by some other person, but finding that nothing was being done, and being continually urged by different makers to proceed in the matter, I put myself in communication with the leading financiers of New York who take an interest in matters of this kind, and found a ready willingness to provide the necessary funds to carry out such a deal based on conservative cash values.

"Having satisfied myself that the necessary money for such an enterprise would be supplied, I then communicated with the principal bicycle manufacturers of the country and found the idea met with a hearty and favorable response,

which has resulted in a definite proposition being made by all the leading bicycle manufacturers for the sale of their various plants on a cash basis.

#### Thirty Concerns Ready to Sell.

"Up to the present time over thirty of the prominent bicycle manufacturing concerns have expressed a willingness to consolidate, and have made a definite proposition for the sale of their various properties.

"It is the desire of those financing this enterprise to take in as many of the going bicycle concerns whose past record, present condition and future possibilities would make desirable, to join in and add strength to the combination. Therefore an invitation has been sent out very liberally to nearly all the smaller as well as the large American bicycle makers, and negotiations are now pending that would indicate the probabilities that 90 per cent. of the entire bicycle manufacturing plants of this country will be brought into this combination."

#### Origin of the Combination.

More specific details have been learned from a reliable source. It appears that some time during December last three of the largest manufacturers in America were approached with an offer to combine their plants. All were agreeable, but the preliminaries dragged to such an extent that the deal was eventually declared off.

Colonel McCook happens to be a neighbor of Mr. Spalding's, and during a conversation, one day in January, let drop this remark:

"Now that money is so plentiful, and combinations are in the air, it seems to me that a bicycle combine would be a splendid thing to float."

The real significance of this utterance did not strike Mr. Spalding at the moment. It was only after telephonic conversation a few days later that he gave serious thought to the proposition. A few days' work showed that it would be a comparatively easy matter to secure the necessary capital to carry out such a stupendous deal. That part satisfactorily arranged, the next move in the game was a talk with one of the largest of western makers, who was so favorably impressed that he prepared a proposal for the sale of his business the next day. A second and a third western concern fell in line as quickly.

#### Another Syndicate at Work.

Strangely enough, there was, at the same time, a representative of another syndicate at work on a similar scheme. He called on at least two Chicago houses, but was not heard of afterward.

There had been such ready acquiescence on the part of all the persons approached that it was decided to offer every reputable maker, whose business was considered sound, an opportunity to come in. A letter was pretty generally circulated, inviting proposals to sell for cash, Mr. Spalding offering his personal pledge of absolutely confidential treatment of all facts and figures submitted.

All this has occurred inside of a month. Options are now coming in by every mail.

Mr. Spalding is, as has been stated, the representative of a syndicate of bankers. It is his part of the work to provide, for their inspection and acceptance or rejection, options on all or as many as possible of the paying bicycle factories of the United States. Each applicant is required to present facts concerning the earnings of his business, his plant and the amount asked, and to agree to continue in the employ of the new company for five years. As the options come in they are handed to Mr. Simpson, an expert accountant selected by Messrs. Alexander and Green, attorneys for the capitalists, for examination. All of the work is done at the rooms at the Waldorf, in strict accordance with the promise of secrecy made at the outset.

#### Examination of the Books.

When all are in the accountant will visit each of the houses, make an examination of books and verify the statements. Then the whole matter will be referred to the capitalists who will pass judgment upon the fairness of the amounts asked.

This shows just how near the combination comes to completion. The promoter is unable yet to state, with certainty, the name of a single participant in the enterprise.

Most of the concerns interested feel, now that the news has been given to the public, that it is unnecessary to remain silent. One of them talked freely with a Cycle Age man and gave interesting information concerning his ideas.

#### To Control Ninety Per Cent of Product.

"We expect to obtain," said he, "90 per cent. of the successful bicycle factories, large and small, and to control at least that percentage of the output of the United States."

"Is it true that some of the factories will be closed?"

"I think not. On the contrary I believe their capacity will be increased. The work of some of them may be changed, however. Some may be employed on a particular style of machine, some on pedals, chains and other parts. There will probably be little change in the factories of the well known makers, however."

"On what do you base your expectation that the output will increase?"

#### Possibilities in Foreign Markets.

"On the possibilities of foreign trade. Our relations with other countries are constantly improving. With the capital at our command we may be able to cover the markets of the entire world. The saving of expense in that direction alone will be enormous. When we go into a foreign country now, who is the competitor we find there? Not the English, French or German, but our next-door neighbor. The result is such competition in the matter of price that there is no margin left. We can produce more cheaply than any other nation and can probably sell foreign buyers all the bicycles they need."

"In what other direction do you expect to economize?"

"In selling expenses, advertising, avoidance of price cutting, purchasing, collections and—well, the possibilities are beyond expression at the moment. These are matters of detail which it is impossible to discuss until the thing has been completed and we settle down to a consideration of ways and means."

#### Possible Control of Parts Factories.

"Is the control of parts factories contemplated?"

"Possibly; we are in this thing to make it as complete as possible."

"How will the present employes be affected?"

"If you look over the list of similar combinations you will find a well satisfied lot of men. The tendency of a combination like this is to enable the maker to increase wages and decrease prices by reason of the decrease in expenses in other directions. There will be plenty of room for every man with brains and energy."

"But what of the concerns from whom you purchase supplies? Will not their business be injured?"

"I think not. Such orders as we can give them will enable them to run under lower expense because they will run steadily the year round."

#### Protection for Legitimate Agents.

"If you succeed will not the number of agents be largely reduced?"

"If some of them, who might be doing better in some other line, were forced out it would be doing them a kindness. For the curbstone agent we have no thought. It is far from our intentions to hurt legitimate dealers, however. We can't afford to. We shall cultivate their friendship and strengthen their positions. We shall insist on maintenance of advertised prices and stop cut-throat competition."

"Will the combination exert a tendency to fix patterns and, to some extent, eliminate the necessity of a shut-down in summer and a rush in winter?"

#### No Shut-Down—Fewer Patterns.

"To some extent, yes. In the northern countries there is bound to be a quiet time. But in the southern and some foreign markets the riding season is at its height while our winter is on. The cultivation of those markets will enable us to run our factories instead of piling up losses because of idle machinery, unproductive rent, insurance and many other fixed charges."

#### What Manufacturers Think Of It.

Following are some opinions received by the Cycle Age concerning the proposed combination:

#### Heartily Favors a Combination.

I am heartily in favor of a combination on the right kind of a basis. In my judgment there could be a very great saving in expenses and in manufacturing. We could sell goods at what they cost now and pay 10 percent dividends on the capital required to form the combination. I think it would not only make bicycles cheaper than they are today, but that it would be much more profitable to all the bicycle makers to form

such a combination. From the raw material to the closing of the sale, at every step, there could be a large saving made by centralization of all the bicycle plants. Such a combination would control the business, as no maker, singlehanded, could attempt to fight so large a combination. I believe that everybody would make more money, be happier, and the public would get their goods for less money than they pay for them today.

I am opposed to trusts which are started to raise prices, but I am not opposed to trusts where their object is to reduce the cost and at the same time give the public goods cheaper than ever before.

In conclusion, will say I am heartily in favor of the effort now being made to form a combination, and hope it will be successful.

H. A. LOZIER.

Cleveland, O.

#### Would Benefit Makers and Dealers.

Our opinion of the proposed combination of bicycle manufacturers is that it would be a very desirable thing if properly handled. The benefit, in our opinion, would be felt alike by the manufacturer and the dealer. If one big combination were handling the whole bicycle business, the general expense could be made much smaller. The selling expense in the bicycle business has always been much too large. The cost of manufacturing could also be reduced by the right kind of a combination. We would be decidedly in favor of such a combination.

FULTON MACHINE WORKS.

Chicago.

#### Advantages of Organization.

In the absence of any definite information as to the methods proposed by the trust, and as the question covers such a wide range, it is difficult to make a candid and unbiased statement. The condition of the bicycle trade at the present moment is a peculiar one. From the close of last season up to within a short period, the prospects for an unusually successful season were never more promising. All indications pointed to an early as well as large demand from the jobbers, and, based upon this, many of the manufacturers ran their plants to their full capacity, making wheels ahead in anticipation of this demand. Nearly all the manufacturers of standard goods have orders booked ahead of their capacity, but we find with perhaps some few exceptions that orders so placed are held for specifications, tying up the capital invested, and in view of the near opening up of the small trade (which is most profitable), creating fears of a congested and unsatisfactory condition to the manufacturer later on. Those who have ample capital can stand this, but others must suffer either in strained financial conditions in extending loans, or by forcing goods on the market in order to realize, thus not only injuring themselves, but also weakening others through the forced cuts in values.

Under these conditions, and this latter has been a weak feature of the business for the past few seasons, any combination formed that will control and protect the general trade would be of undoubted advantage, and we believe none appreciate these conditions more than the makers of the so-called high grade wheels. The trade, both makers and sellers, want stability in prices and output; otherwise we have a constantly disorganized condition.

But will the creation of a pool or combination secure the golden results? The making of wheels has reached a point where small profits and good workmanship are the principal factors, and the public has been educated up to the knowledge that first-class wheels can be made and sold at a price that will reach the public's ability to buy. There are a large number of the makers of this class of goods who will be reluctant to surrender a good profitable business ahead of them and will be disposed to combat any interference with their rights. A combination that does not include all will fail of its ob-

ject, and a combination that does include all will be a very heavy undertaking and open the field for new business. If amicable arrangements can be entered into whereby prices can be maintained with those who do not wish to surrender their business rights and yet who will live up to an agreement reached of this kind, then the pool, trust, combination, or whatever name be given to it, would be most welcome and would infuse new life into the trade; but any combination looking to the extermination of the outside manufacturer would soon meet a condition of things worse than that of '97 or '98, when bankrupt wheels kept the trade poor and demoralized not only the makers and dealers, but the individual rider also.

In the general acceptance of the term trust, it is a proposition not favored by the people as a class, and yet a combination that will permit moderate returns of capital invested, give stability and permanence to the trade, means much to the community. It means regular wages and steady employment to the thousands who are in workshops, safety and security to the investor, and a benefit to the rider, who will be assured of honest work and faithful guarantees with his purchase. We know nothing of the proposed trust, nor of its contemplated way of dealing with the situation now confronting the trade, but, from the high standing of those whose names are prominently mentioned, we believe some happy medium can be reached whereby none may be injured and all who believe in true business methods may be benefited. Owing to the many labor saving devices controlled by this company and having a good financial backing, we feel that we are able to compete with any conditions that may arise; yet we, in common with all others, feel the ill effects caused by the weak concerns and unfortunate conditions. With this in view, we would be glad to see some plan perfected that would be to the mutual interest of all.

NATIONAL AMERICAN CYCLE CO.

Akron.

#### Will Benefit All Concerned.

We are inclined to favor such a movement and would lend it our support if it can be carried out on a sound basis. It cannot be doubted that it will affect beneficially all the interests concerned.

LEAGUE CYCLE WORKS.

Milwaukee.

#### Everything Depends on Management.

We prefer to suspend judgment on the question of the proposed \$50,000,000 bicycle manufacturing combination until we have all of the facts accurately before us. A combination of this kind properly and ably devised and executed would prove of great benefit to all concerned; otherwise a curse.

DAY MFG CO.,

Lake View, N. Y.

#### Would Join Only for Protection.

We view with alarm combinations of capital in all branches of trade, as it is a menace to the people of the United States. We would only join a combination of this kind for self-protection.

ADIRONDACK CYCLE CO.

Buffalo.

#### Price Cutting is Rampant.

The present season, as well as previous years, has witnessed quite a considerable cutting in prices in bicycles to the dealers and jobbers, and in many cases below the point of making any profit. We believe something ought to be done to stop this wholesale cutting of prices.

THOMAS MFG. CO.

Springfield, O.

#### Would Meet With Success if—

While the writer does not feel disposed to offer an opinion as being that of the Albany Mfg. Co., personally I am of the opinion that a combination composed of the manufacturers of bicycles and bicycle sundries,

WAGNER & CHABOT, Wholesale Bicycles and Supplies.  
SAN ANTONIO, TEXAS, February 6th, 1899.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—We received a card from you on which was printed a testimonial from a cycle dealer in San Antonio, which we think is very good, but as this is a very much harder place on tires than that part of the state, we beg to say a good word in behalf of the MILWAUKEE TIRES. They are the BEST that money can buy. We have had the smallest tire you turn out on a Road Tandem, and it has never been punctured and has been in service for one year. We have the best and most reliable wheelmen in El Paso riding the tire and never any sign of a puncture. People that we used to get from one to two dollars a month from, that are now riding Milwaukee Tires, never call for any repairs at all, and it is common for the tires to go from one to six months without pumping. No one using MILWAUKEE TIRES in El Paso will hesitate to recommend them upon request. Yours,  
McCUTCHEON, PAYNE & CO.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen:—We are pleased to state that the pair of tires you sent us about six months ago have been giving excellent satisfaction. We believe the hardest test on a tire is to put same on the rear wheel of a tandem. We put one of the tires on the rear wheel of our tandem and the other on the rear wheel of a Collector's wheel, who uses his wheel very hard. Neither of these tires has yet had a puncture and are giving excellent satisfaction. We believe you to have the best tires of their kind made and for this reason have taken the exclusive agency for this section. As we have duplicated our order to you within the last 30 days you can know we are doing well. Will be pleased to recommend same at any time. Yours truly,  
WAGNER & CHABOT.

## BRAZED OR MECHANICAL JOINTS

If there is any method of uniting one thin steel tube with another that combines strength with lightness in as high a degree as brazing, neither the manufacturing world nor the public have yet arrived at the point of believing in it with that deep faith which prompts final and decisive action. There may be a lingering hope of some day seeing a perfect mechanical joint, but in all the English, German or American mechanical joints, which have so far seen the light of publicity—except perhaps the “hydraulic” joint which has other disadvantages—there has been a plain showing of special provisions against rupturing the very tubing or lugs which were to be joined, and these provisions always meant an addition of metal and weight which did not strengthen the bicycle frame to endure the work for which it was built, but acted solely to resist new strains which were permanently put into the frame and made part of its constitution by the joining process.

Small binding surface with its attending dangers of rupture, or superfluous weight massed at the joints with the unavoidable accompaniments of disagreeable vibrations and “dead” running of the bicycle, have in the public’s judgment appeared to be objections fully as important as any that may be raised against brazing, even in England where the somewhat general use of tubing of small diameter and heavy gauge makes the mechanical joint more acceptable than it would be here.

Liquid brazing has now further removed the only valid objection which from the rider’s standpoint may be raised against brass as a joining agent. The danger of burning the steel tubing has been almost completely eliminated by the dipping process; and there seems to be little doubt that the process will be developed to the point where only a uniformly thin coating—if any—will be left on the joints and tubing externally. If this coating may then further be used as a substratum for nickeling or other forms of finish, there would seem to be little use for any other manner of making joints, even from the manufacturer’s point of view.

The whole question of frame building, however, will of course ultimately be determined by the relative economy of the different working methods by which generally satisfactory results may be obtained. If a mechanical joint were devised which would inspire the public with confidence and would merit it, and it also proved preferable for turning out a large quantity of bicycles in a short time or gave a better chance for attractive finish or relieved the small builder of the necessity of having a brazing equipment, it would undoubtedly gain popularity. This time may be far off yet, but the following communication from Henry Souther, well known to the trade as an expert on steel tubes and bicycle tests, will show that the idea of supplanting all brazing in bicycle frames with mechanical joints is not considered as premature by all to whose opinion practical connection with the bicycle industry and scientific training lend weight. Mr. Souther writes as follows:

To the Editor:—In your issue of March 16 you have rather an interesting article on a so called new way to remove brass from a brazed joint. A year or two ago while I was in the employ of the Pope Company a thing of that sort was hinted to me and finally thought out and tried.

Ordinary nitric acid attacks brass very rapidly, so it does steel. Very strong nitric acid attacks brass even more rapidly than the weak, if possible, and strange enough does not attack steel at all if kept cold. If action once sets in, however (it will if the acid is heated), the reaction is very violent, approaching the nature of an explosion, or at any rate being so violent as to cause the solution to boil over from a containing vessel.

Here then was a process that seemed perfect and likely to be a bonanza. It was tried; the thin layers of brass were removed

perfectly; but there were some large lumps of brass at several points as is usually the case. To get these off the whole joint was left in the acid; they came off all right, but while the acid was eating them off it ate itself into the nicely brazed joints where it was not wanted. The process was therefore a failure under the existing condition of things. If someone will only braze so as to leave a thin uniform layer of brass where it is not wanted, then the above scheme will do the work. It will be disagreeable to the workman and troublesome as all pickling methods are; but the manufacturers are so accustomed now to such troublesome things that they are regarded as being unavoidable and the only practical way. The best way to get rid of the brass left on the tubing after brazing is to do away with the brazing. With it will disappear pickling and filing.

Many so called mechanical joints have been made and tested here and abroad and have proved mechanical successes. As far as I know they have not proved commercial successes and it is quite possible that the trade is not yet ready for this radical change.

I cannot think that the manufacturer or the consumer will continue to believe much longer in the barbarous method of brazing with its necessary pickling and filing. In connection with brazing the delicate tubing used is submitted to the worst forms of maltreatment possible. First a high heat in contact with melted brass without subsequent treatment to restore it to the fine condition in which it was when it reached the brazer. Second pickling, which is most injurious to steel, and a fact acknowledged by all those familiar with the process. Finally the file, which at one misplaced stroke may cut half way through the thin walls of the tube, and then be skillfully covered up by some careful filing.

Believing as I do in the intelligence of our manufacturers, I cannot think they will continue this method with the easy way of avoiding it above referred to, even if they have to modify their commercial wishes for a while.

## CAPITAL FOR MOTOR VEHICLES

It seems not impossible that capitalists whose participation in the motor vehicle industry has been solicited in favor of steam, gas or electric vehicle construction may have been deterred by observing the aggregation of moneyed forces which are engaged to boom compressed air motors—an alleged competitor among forms of driving power. Capitalists are not anxious to enter into competition with a capital that overshadows their own.

It is also said that mercantile houses which had figured on replacing their horse stables, teamsters and freight wagons with automobile vans have halted in their deliberations and negotiations under the impression that the auto-truck syndicates in process of formation might soon be in position to contract for hauling merchandise at a figure which no individual firm could afford to overlook. All anxiety on this score seems, however, absolutely unwarranted, when it is realized that air motor syndicates have no more to do with the motor vehicle industry than have the fluctuations in cable car or trolley line street railway stocks. The money which has been—conditionally—subscribed for the syndicates is enlisted in the noble art of franchise grabbing. The political deals which lie back of them are organized with a view to insuring the votes of city fathers and the freedom of city streets. The locomotion contemplated is rail locomotion, preferably. The auto-trucks and air motor carriages stand in the background as words to conjure with, but represent in reality a form of automobilism which would not draw any capital on their commercial and mechanical merits, as compared with electric or other self-propelled vehicles. Were it otherwise, the stock of the syndicates would not have fluctuated, as it did, before any vehicles had been completed. The fluctuations would have waited on public and indisputable tests of fitness.

There is undoubtedly a large business in store for successful builders of self-propelled freight wagons. In the large cities stable room is costly, and the expenses go on from day to day independently, or almost so, of the variations in volume of work. Many commercial houses, therefore, prefer to contract for their freighting with companies that make this class of work their exclusive business. But the inconveniences of this system are many and grievous. The automobile freight van promises relief.

Its advantages are strictly those which recommend it for individual ownership, and it seems extremely doubtful if any syndicate will be able to offer sufficient inducements to secure hauling contracts from any but very small wholesale houses, after once the competition among motor vehicle constructors shall have produced a choice of suitable vehicles for this class of work. In this competition the compressed air syndicates hold the most remote chance of coming out ahead.

## REPAIR PRICE SCHEDULES

### Adopted by Organized Dealers and Repairmen in Minneapolis, Buffalo and Des Moines

Minneapolis, March 20.—At a recent meeting of the bicycle dealers and repairers of this city a strong organization was effected under the name of the Minneapolis Cycle Trade Association. Fully 80 per cent. of the dealers and repairmen of the city have already signed the constitution and by-laws of the association, and the majority of the others have signified their intention to do so.

The object of the organization is to promote the common interests of the members. A schedule of prices has been adopted, which is fair both to the dealer and rider, and every member of the association is required to deposit a specified sum with the treasurer as security for the payment of fines that may be assessed by the committee appointed for this purpose for any breach of rules of the association.

#### Only Members Secure Dealer's Prices.

Membership cards will be issued which will entitle all members to the privileges of the association and secure for them dealers' prices from local jobbers who are co-operating with the movement.

One object of the organization will be to induce jobbers to sell only to members of the association who are in good repute, and some system will probably be adopted of reporting to the association those wholesale dealers who sell to non-members at dealers' prices.

Meetings will be held the second Tuesday in each month, and a suitable meeting place will be decided upon that may develop into a general rendezvous for the bicycle trade.

Dues and membership fees are provided for, which, with fines assessed, will furnish a liberal fund for carrying on the work of the association.

#### Adopted Schedule of Repair Prices.

The following list of repair prices has been signed by sixty-six dealers and repairers of this city, and the association is hopeful of having them generally lived up to. Various associations in other parts of the country have secured copies and intend to duplicate them. It is quite certain that the cycle dealers of St. Paul will adopt the schedule complete:

#### Frame Repairs, Enameling Extra.

Cutting down frame and increasing drop . . . . . \$5.00 up  
Cutting down frame, no drop . . . . . 4.00  
Putting in new tube . . . . . 3.00  
Brazing broken tube . . . . . 2.00@3.00  
Joint . . . . . 1.50  
Rear fork ends, each . . . . . 1.50@2.50  
Rear stay tip . . . . . 1.50  
New head in . . . . . 3.50 up  
New seat post bracket in . . . . . 3.50  
Rear bent fork stay in . . . . . 3.00  
New upright stay in . . . . . 3.00  
And finishing new crank bracket . . . . . 5.00  
Lining up frame . . . . . .75@2.00

#### Repairs to Forks.

New fork stem . . . . . \$2.50  
New fork sides, each . . . . . 1.50@2.50  
New fork crown . . . . . 3.00  
Repair fork side . . . . . 1.00  
Repair fork stem . . . . . 1.00@1.50  
New tips, each . . . . . 1.00@1.50  
Truing fork front . . . . . .50  
Fork front and head stem . . . . . .75  
Head stem . . . . . .50

#### Enameling.

Plain enamel . . . . . \$3.00  
Transfers (extra) . . . . . .50  
Rims (extra) . . . . . 1.00

#### Lacing and Fitting Dress Guards.

Lacing ladies' machine all over . . . . . \$ .75  
Mud guard . . . . . .50  
Chain guard . . . . . .35  
(These prices include mohair cord.)

Fitting wire chain guard . . . . . .25  
Rear wheel guard and chain guard . . . . . .75

#### Repairs to Chains.

New link . . . . . \$ .25  
New link, each, additional . . . . . .15  
Cleaning chain . . . . . .25

#### Mending Handle Bars.

(Materials extra.)

New stem . . . . . \$ .75  
Turning over bar (nickeling extra) . . . . . .75  
Making new bar, finished . . . . . 3.50  
Cementing one grip on . . . . . .10  
Two grips on . . . . . .15

#### Sprocket Repairs.

New front sprocket, 22 teeth and less . . . . . \$2.50 up  
New rear sprocket . . . . . 1.50@2.00  
For each additional tooth in each, extra . . . . . .10  
Brazing sprocket to shaft . . . . . 1.00

#### Repairs to Wheels.

New front hub, at list; labor extra . . . . . \$2.00  
Read hub, at list; labor extra . . . . . 2.50  
Set best grade spokes, front . . . . . 2.00  
Set best grade spokes, rear . . . . . 2.50  
Rim and best grade spokes . . . . . 3.00  
Rim put in, plain . . . . . 2.00  
Rim put in, laminated . . . . . 2.50  
Rim put in, enameled, extra . . . . . .50  
Rim put in, G. & J. and Dunlop . . . . . 2.50  
Truing wheel . . . . . .25@1.00

#### Cleaning Machine and Bearings.

Cleaning wheel bearing . . . . . \$ .25  
Hanger . . . . . .50 up  
All bearings . . . . . 1.00  
Outside and oiling . . . . . .25

#### Putting in Spokes.

One spoke . . . . . \$ .25  
Each additional spoke . . . . . .10  
(Extra charges for special spokes.)

#### Cranks Finished.

Plain crank . . . . . \$ .75 up  
Spider crank . . . . . 1.25  
Two-piece crank . . . . . 1.50@2.50  
Special two-piece crank, at list, time charge . . . . . .50  
Crank key put in . . . . . .25  
Straightening crank . . . . . .25  
Straightening pedal pin . . . . . .25  
Plugging or welding crank end . . . . . .75  
Splicing crank . . . . . .75@1.00

#### Replacing Axles With New.

Hanger axles . . . . . \$1.50@2.00  
Wheel axles, each . . . . . .50

#### Lathe Work.

Old cones, dressed down . . . . . \$ .50  
New cones . . . . . .75@1.00  
Ball cups . . . . . .75@1.50  
Bolts . . . . . .25@ .50  
Nuts . . . . . .10@ .25  
Pedal pins . . . . . .75@1.00

#### Crating Bicycles.

Uncrating and adjusting new machine . . . . . \$ .50  
Crating machine . . . . . 1.00

#### Tire Repairs

Vulcanizing one place, tire on bicycle . . . . . \$ .75@1.00  
One place, tire off bicycle . . . . . .50@ .75  
Old stem hole and inserting new stem . . . . . .75  
Each additional place on same tire . . . . . .35  
Plugging, any tire . . . . . .25  
Each additional hole . . . . . .15  
Patching inner tube, tire on rim . . . . . .35 up  
Inner tube, tire off . . . . . .35  
Inner tube, and recementing tire . . . . . .50  
Clincher tire on rim . . . . . .25  
New valve and stem on inner tube tire . . . . . .50  
Cap . . . . . .05  
Inserting metal stem . . . . . .50  
Common valve . . . . . .25  
New inner tube put in, add to list . . . . . .25  
New end on inner tube . . . . . .50  
Cementing on tire . . . . . .25

#### Storing Bicycles.

Per month, not cleaned . . . . . \$ .50  
Per month, cleaned . . . . . .75

#### Rental Rates.

Week days—Single machines: First hour, 30 cents; each additional hour, 20 cents;

evenings, 50 cents, afternoons, 50 cents; one day and evening, \$1; one week, \$3; one month, \$8.

Sundays—Single machines: First hour, 35 cents; each additional hour, 20 cents; one day, \$1.25; afternoon, 75 cents; evening, 50 cents.

Week days—Tandems: First hour, 50 cents; each additional hour, 30 cents; one day, \$2; one week, \$5; afternoons, \$1; evenings, \$1; one month, \$12.

Sundays—Tandems: One day, \$2.50; afternoon, \$1.50; evening, \$1.

### BRIGHT PROSPECTS IN IOWA

#### Improved Industrial Conditions and Reduced Lists Will Increase Sales—Agents Hustling.

Des Moines, March 20.—Present trade conditions indicate that more standard bicycles will be sold here this season than cheaper grade machines. Agents are disposed to carry a better grade of machines than they have for the past two years. This is brought about apparently by the trouble and expense they have been put to in keeping the cheap wheels formerly handled by them in condition. In certain localities where nothing but cheap machines have been sold heretofore, however, an honest high grade bicycle is hard to find.

#### Laboring Men Become Purchasers.

Indications also point to many more sales of bicycles this year than heretofore. About 1,500 new bicycles were sold in Des Moines last year and the trade will probably increase fully twenty-five per cent. Laboring men are all employed and at higher prices than have been paid for some years. Since the prices have been reduced they are buying bicycles. Business generally is in good condition and bicycle agents are using every means to increase sales. Some of them are sending their salesmen out to canvass from store to store for possible purchasers.

Bicycles retailing at from \$35 to \$50 will sell best here. No curbstone agents have arrived on the scene so far this season. Thirty-inch wheel bicycles are not being sold nor does the prospect look encouraging for this model. More chainless bicycles will be sold than last year, however, on account of the reduction in price.

#### Experienced Dealers Have Reduced Lines.

Fourteen agents are now carrying bicycles in stock, each handling from two to thirty-four different makes. But agents with years of experience in the bicycle business are carrying but two or three standard makes, believing it easier to talk more intelligently on these than on two or three dozen. Many customers become confused when taken through a store and shown many lines at different prices and varied construction.

Most of the dealers have all their '99 samples on the floor and a fair number of sales have been made. As soon as bright, warm days come large numbers of sales are anticipated.

#### Renters Will Become Buyers.

Since the prices of bicycles have been reduced the returns from renting of singles and tandems will be materially less because riders who used to rent them will buy their own machines.

A great many second-hand bicycles were taken in exchange or as part payment for new ones last year, and the prices that were allowed were generally too high, necessitating agents to sell them at no fixed price, which resulted in losses to many. This year the dealers have united and pledged themselves not to allow more than \$15 for any second-hand bicycle taken in trade.

#### Schedule of Repair Prices Adopted.

The following schedule of repair prices was adopted by the local dealers and repairmen, and there has been very little

deviation from them since the schedule went into force:

Axles, front or rear, die made.....	\$.50
Front or rear, lathe made.....	.25
Crank, plain.....	1.50@2.00
Cleaning all over.....	1.00
Crank hanger bearings.....	.25@.50
Front wheel bearings.....	.25
Rear wheel bearings.....	.25
Head bearings.....	.25
Pedal bearings.....	.40
Chain and oiling.....	.25
Cranks, each.....	1.25@1.75
Cementing on tires, each.....	.25
Cone, crank hanger, stationary, not threaded.....	.75
Crank hanger, threaded.....	1.00
Crank hanger, stationary, threaded.....	1.00
Crank hanger, adjusting.....	1.00
Front or rear wheel.....	.75
Chain link or part of link put in.....	.25
Cotter pins, each, put in.....	.25
Enameling frame.....	4.00
Rims or refinishing same.....	1.00
Fork tips, each.....	1.00
Per pair.....	1.50
Straightening fork.....	.75@1.00
Lining rear fork.....	.75@1.00
Fork sides, each.....	1.50
Per pair.....	2.50
Grips, per pair.....	.25
Each.....	.15
Pair, put on.....	.35
Each, put on.....	.20
Repairing broken handle bar, without plating.....	1.00
Repairing broken handle bar and plating.....	1.50
Lacing chain guard.....	.25
Rear mud guard.....	.25
Punctures, per hole.....	.25
Rims, plain.....	.50
Laminated.....	1.00
Plain, put on.....	2.25
Laminated, put on.....	2.75
Spokes, each.....	.05
Per dozen.....	.50
Single, put in.....	.25
Two put in.....	.40
Three put in.....	.50
All new, single wheel.....	2.00
All new, two wheels.....	4.00
Sunbeam, single wheel.....	2.50
Sunbeam, two wheels.....	5.00
Steering head repaired when broken	1.00
Striping frame.....	1.00
Vulcanizing, single hole.....	.75
Valve stem.....	1.00
Valve stems, metal, put in.....	.75
M. & W., put in.....	.35
Valve, M. & W., put in.....	.25

**REPAIR PRICES IN BUFFALO**

Dealers' and Repairers' Association Adopts Last Year's Schedule with Few Changes.

Plugging single tube tires.....	\$.25
Vulcanizing, plugs.....	.50
Patches or rim cuts.....	.50 to \$.50
Valve stems.....	.50
Valve stems and new valve.....	.75
Metal base valves put in.....	.50
Patching double tube tires.....	.50
Putting in new inner tubes, tube not included.....	.50
Valve caps and washers.....	.10
Valve springs and plungers.....	.15
Cementing on tires.....	.25
Inserting tire fluid, each.....	.50
New valves put in.....	.25
Axles, front and rear, each.....	.75
Crank axle.....	2.00
Brazing, frame and fork (when set up complete).....	1.50
One new tube in.....	3.00
Two new tubes in.....	4.00
Enameling above.....	1.50
Brazing fork stem.....	1.50
New fork crown, enameling and nickeling.....	3.00
One new fork side.....	2.00
Two new fork sides.....	2.50
One fork tip.....	1.00
Two fork tips.....	1.50
One joint in frame and enameling	3.50
Chain bolt.....	.10
Seat post bolt.....	.15 up
Handlebar bolt.....	.15 up
Building frame, material furnished.	6.00
Chain link.....	.25
Chain link, extra.....	.10
Cones, each.....	.75 up
Cases, each.....	.75 up
Cranks, plain.....	.75
Cranks straightened.....	.25
Cotter pin put in.....	.25
Cementing grips, pair.....	.10@15
Cleaning wheels.....	1.25
Enameling frame and fork, plain...	2.25
Frame and fork, striped.....	2.50
Frame and fork, white and delicate colors, plain.....	3.25
Frame and fork, white and delicate colors, striped.....	3.50
Frame and work, white and delicate colors, transfer.....	3.75
Enameling fork.....	.40
Rims.....	.75
Spokes.....	.50

Guards.....	.25
Frames remodeled.....	6.00
New fork nickeled and enameled...	3.50
Guards, dress, with fittings.....	.75
Chain, with fittings.....	1.00
Dress, laced.....	.50
Chain, laced.....	.35
Chain, laced all over.....	.75
Hubs put in, price of hub not included, each.....	1.75
Lining frame.....	1.00
Front fork.....	.50
Nickeling, fork crown and tips.....	.50
Fork crown.....	.35
Fork crown, fork complete.....	1.00
Sprocket.....	.50
Handlebar.....	.50
Single crank.....	.25
One-piece crank.....	.50
Spokes.....	.02
Seat post.....	.25
Hubs, per pair.....	.75
Pedals, per pair.....	.50
Cases and cones.....	.10
All nickel parts of machine.....	5.00
And enameling whole machine.....	7.00
And enameling whole machine, less wheels.....	5.00
Rims put in.....	2.00
Sprockets, rear.....	.75 up
With spider.....	2.50
Put on, price of sprocket not included.....	.50
Spokes.....	.10
Truing wheels.....	.25 up
Time, per hour.....	.50

**WINONA GETS IN LINE**

Forms an Association Including Every Dealer But One—Repair Price Schedule Adopted.

The bicycle repairers of Winona, Minn., have met and organized the Winona Bicycle Dealers' Association, the object being to maintain a just schedule of prices on repairs. The following officers were elected: President, W. A. Sorg; vice-president, E. J. Davis; secretary, Frank Vila; treasurer, T. J. Heller. Every bicycle dealer in town with one exception has joined in the movement, even including the department store. In addition to regulating repair prices the association has arranged a system of checking up the delinquent purchasers, so that every dealer can have a complete list of bad customers in his vest pocket.

The use of a pump will be freely granted to riders, but a charge will be made for pumping up tires.

The list of repair prices is as follows:

Axles, front or rear.....	\$.50
Bolts in handle bar clamps.....	.25
In seat post cluster.....	.25
Balls, sizes up to 3/8, each.....	.02 1/2
3/8 and up, each.....	.05
Putting in.....	Extra
Chain adjusters, stampings, each...	.25
Forgings, each.....	.25
Chain, one link put in, block or sides.....	.20
Taking out one link.....	.10
Cotter pin, one, sold at retail.....	.10
Put in and fitted.....	.15 up
Cup, for common hub.....	.50
Made to order.....	1.00
Cone, common hub, made to order.	.75
For crank hanger, made to order, each.....	1.00
All adjusting cones made to order	1.00
Cups for head, made to order.....	1.00
For head sold at retail.....	.50
Welding cranks, each.....	1.00
Cranks, new, each.....	1.00
Crank shaft, old style, 2 key way..	2.00
Adjusting nut on.....	.35
Cleaning bicycle, inside and out...	1.00
Outside and oiling.....	.25
Oiling only.....	.10
Cleaning spokes when rusty.....	.25
Dress guard, lacing same.....	.50
Chain guard, lacing same.....	.25
Dress and chain guard, lacing both	.75
Chain guard put on.....	.75
Dress guard put on.....	.75
Fork stems spliced.....	.75
New fork steps.....	1.50
Fork crowns, arched.....	1.50
Plate crowns.....	2.00
Fork sides, each.....	.75
Fork tips, each.....	.75
Forks, complete.....	3.50
Enameling forks, extra.....	.50
Head lock nut and washer.....	.50
Upper tube.....	2.50
Lower tube.....	2.75
Seat post tube.....	3.50
New head lug.....	2.25
Rear stays spliced.....	2.00
New rear stays.....	2.50
Seat post cluster.....	3.00
Hanger bracket.....	4.50
Rear fork ends, each.....	1.00
Braces in the rear forks.....	.75
Splicing seat post or handle bars..	.50

Common grips.....	.25
Leather, turned or covered.....	.50
Puncture, double tube tire, wheels in frame.....	.50
Double tube tire, wheel out of frame.....	.35
When inner tube is out of casing	.25
Patching inner tube when hole is located.....	.10
Clinchers on wood rims.....	.25
All other clinchers, by the hour....	..
Punctures, single tube tires.....	.25 up
Puncture cure, one tire.....	.50
Two tires.....	.75
Front sprockets.....	2.00 up
Rear sprockets.....	1.25 up
One new rim put on, with old spokes and hub.....	2.00
Enameled rims, extra.....	.35
Clincher rim put on with old spokes and hub.....	2.50
Rim and spokes.....	2.75
Per pair.....	5.25
One spoke, front wheel.....	.25
Two spokes, front wheel.....	.35
Three spokes, front wheel.....	.45
Each additional spoke.....	.05
One spoke, rear wheel.....	.25
Two spokes, rear wheel.....	.40
Three spokes, rear wheel.....	.50
Each additional spoke, rear wheel.	.05
Full set of spokes for a pair of wheels.....	2.00
Spokes sell retail for the first five, each.....	.05
Each additional after first five.....	.02
Sunbeam spokes, double price at present.....	..
Truing up wheels, per hour.....	.40
Tires cemented on rims, each.....	.15
Two for.....	.25
Inner tubes, plain, put on.....	1.50
Quick repair, put on.....	1.75
When not put on, inner tubes sell for 25c less.	..
Vulcanizing.....	.75 up
Valve and stem.....	.50
Metal base.....	.50
Valve only.....	.25
Valve stem only.....	.25
Using old valve.....	.35
Rent of Bicycles—First hour.....	.25
Three hours.....	.50
One-half day.....	.75
From 7 a. m. to 6 p. m.....	1.00
Evening.....	.50
Tandems, double rate.	..

**REFUSE TO COMBINE.**

Dealers of Lynn Decline to Join Movement in Surrounding Towns to Uphold Repair Prices.

The bicycle dealers of Lynn, Mass., have been approached by representatives of a combine formed by the dealers of Salem, Beverly, Danvers, Peabody, and other surrounding towns, but the Lynn men have refused to join. The object is to insure a uniform rate of prices for repairing bicycles and furnishing stock.

The repair business is very important to Lynn dealers, as many riders pass through the city. Two previous attempts to form a combine of the Lynn dealers proved ineffectual. The prices adopted by the dealers of the neighboring cities and towns are as follows, on the repairs most generally called for:

Repairing puncture, 50 cents; plugging or quicksealing punctures, 25 cents; new inner tubes, butt ended, \$1.50; endless inner tubes, \$2; new spokes, 25 cents apiece, for two; over two, 15 cents apiece; new chain links, 25 cents; enameling, from \$3 to \$5, according to the fancy work; cleaning, \$1.50.

Lynn dealers will not make repairs on manufacturers' guarantee. All parts of standard bicycles will be furnished at catalogue prices, with the labor added, but new machines will be sent to the manufacturers for repairs.

**Warwick Creditors to Receive Dividend.**

The Warwick Cycle Manufacturing Company of Springfield has been ordered by court to pay a 5 percent dividend to its creditors in addition to the 10 percent dividend previously ordered. All preferred creditors not paid were ordered paid in full.

The Colorado legislature has a bill before it which provides that the second Saturday in June shall be a public holiday, to be known as "Wheelman's Day."

## BICYCLE MAKERS TO COMBINE

(Continued from page 633)

with proper officers and judicious management, could not fail to meet with success. But it should be the purpose of a corporation of this magnitude not to endeavor to obtain extortionate prices to realize fictitious profits, as in all cases of this character it is usually only a question of time that they become failures. I am of the opinion that combines should rather be a means of lowering prices to a fair and legitimate profit than otherwise, and when carried out on that line it cannot help but succeed, and at the same time prevents irresponsible concerns without capital or credit from entering into the business with only one view, and that to ruin prices, obtain all of the goods they can on credit and wind up with an assignment before the close of the season. I believe a combine such as is contemplated will do away largely with just such concerns and keep them out of trade, for they certainly are of no benefit either to the public or other manufacturers.

There can also be a great saving in the running and management of a plant or plants of this character in many ways too numerous to mention. I had, before entering into the tube business, about twenty years' experience in the jobbing trade, and I am well satisfied that our profits could have been largely increased and goods sold at a closer margin had there been a combination in our line such as the one contemplated.

ALBANY MFG CO.

Albany, Ind.

### A Combination That Would Win.

We have not heard much of the proposed combination of bicycle manufacturers. There are combinations which succeed and those which do not. We believe a combination in the interests of the bicycle manufacturers which would maintain a regular price, regulate the number of bicycles to be manufactured, cut off a large number of traveling men, reduce the expense of selling, and thereby reduce instead of increase the cost to the consumer, would be a good thing for all interested parties, and would be a combination which would win. We do not believe in a combination which throws a lot of watered stock on the market for the benefit of a promoter which must be paid for by an increased cost to the consumer, if paid for at all. We do not see that such a combination would affect tire makers one way or the other.

INDIA RUBBER CO.

Akron, O.

### Would Help the Rim Business.

Relative to a combination of bicycle manufacturing interests, wish to say our opinion is that it would be a good thing. Have not the time to give our reason and arguments, but we have a lot of them. We think it would help the rim business, and it is much in need of help.

Eaton, Ind.

EATON MFG. CO.

### Combination Will Benefit Everybody.

We are heartily in favor of such a move. We believe it will check the growing tendency to run down the bicycle business and establish it on a firmer basis. We are certain it will be a benefit in the end to every manufacturer, jobber and retail dealer. It will prevent cutting of prices and equalize prices.

BLACK DIAMOND CYCLE CO.

Kutztown, Pa.

### All the Year Round Manufacture.

It would undoubtedly produce a stability in the manufacture of bicycles which would enable bicycle makers, as well as those who manufacture accessories, to run their establishments through the entire year, and in that way be an advantage not only to the manufacturers, but also to the laborers em-

ployed in the various establishments. So far as its effect upon the line that we manufacture is concerned, we think it would be an advantage, because we would not be obliged to run our establishment over time during six or eight months of the year, but could make the goods with more deliberation by working the entire year.

WESTERN AUTOMATIC MACHINE SCREW CO.

Elyria, O.

### Much Money Required to Control.

We have so few details in regard to the proposed combination of bicycle manufacturing interests that we are not in a position to speak intelligently upon the subject. The newspaper accounts differ so materially that we are unable to understand just what the combination's objects are.

A combination of manufacturers to control the bicycle manufacturing business would find it very difficult to accomplish the desired end. It would seem to us that it would be necessary to control not only the output of tubing in this country, but also the European products. Unless this were accomplished it would be necessary to buy out all of the fittings people, as there are so many houses who inside of a week could commence building bicycles. There are many factories making complete fittings for bicycles, and, with a stock of tubing, nothing would prevent their manufacturing wheels in quantities.

Heavily capitalized trusts or combinations in any line of business are usually of great benefit to the controlling interests; that is, the larger concerns swallow up, as it were, the smaller ones, giving stock in the syndicate for appraised value and business of the smaller concerns and controlling this stock as they may see fit in the future. Small concerns, as a rule, are much better off to stay out of large combinations, unless they can sell out for cash. Stock issued by a syndicate may or may not be valuable, and is often manipulated to the extent that the smaller holders are compelled to dispose of their stock.

We cannot state what the effect of the proposed combination will be upon any part of the bicycle industry until we have fuller details than we now possess. The bicycle industry is spread over so large a field that it would in our opinion require a great deal of cash capital to control it.

Chicago.

GEORGE G. BRANDENBURG.

### Difficulty of Adjusting Values.

We have an idea that, owing to the probable difficulty of satisfactorily adjusting values, the combination will hardly materialize. However, as to its effect on builders and the cycle trade in general, in our opinion it would affect neither to any great extent as long as the demand for wheels and the excellent financial condition of the country continue as at present.

Cleveland, O.

W. E. KELLY MFG. CO.

### Hostile to Parts Makers.

We hardly think that the combination could be accomplished, especially when the parts men are offering to all who have money to pay any individual part or complete parts for a bicycle at such prices as now prevail. It is certainly ridiculous the way things are going in the bicycle trade. We know of mechanics working in iron works sending for parts and making their own wheels. All repairmen are now manufacturers of bicycles. You cannot crush these out. After the combination they will spring up like mushrooms all over the country, and there is enough of them now in every town to supply local trade.

If the combination of bicycle interests, with a capital of \$50,000,000, could crush out

the parts people, both finished and unfinished, it would be a good thing, but we do not think that could be accomplished. Still, there is no knowing what can be done until a trial is made. The gratuitous distribution of promiscuous parts through the guarantee does much to demoralize the bicycle trade. Ninety-nine bids fair to be worse than '98 as '98 was worse than '97; what the end will be is hard to say.

CYCLOID CYCLE CO.

Grand Rapids.

### Other Combines May Arise.

Any objections on the part of non-interested parties would be of no avail whatsoever, as the era of trusts and combines is upon us and there is no way of escaping its baneful influence, its consummation being inevitable. Every large interest will eventually be controlled by a trust of some character, especially for the purpose of reducing general expenses, an item which in itself will indirectly increase prices, although an advance will not actually take place.

This combination, if accomplished, will naturally force other branches of the industry to adopt similar tactics in order to protect their individual interests against the possible dictatorial manifestos of the other combine. It is but a question of the saying, "The big fish eat the small," being changed to "The whale eating the big fish," when trusts will have become general and the policy of "everybody for himself and the devil take the hindmost" will be exemplified in an organized plan.

### Would Not Care to Enter Combine.

We do not think that we would care to enter a combine and be tied down to doing business on the basis that the combination seems to lay down. For instance, they seem to be inclined to agree to not sell their wheels below a certain price. Our objection to such a proposition as that would be this: While we know our goods are just as good and better than a great many, at the same time the fact of these people who compose the combination having lots and lots of capital at their disposal, they would have the advantage over the manufacturer who did not have unlimited capital to back him up in pushing his goods to the extent these other people are able to do. We would not have capital enough to advertise so extensively, nor to hire traveling men to cover every piece of territory that these people could afford to do; so therefore we think we would be putting our neck in a noose by tying up on any such agreement.

We do not think that they can make a success of it without the trust buys up the smaller manufacturers and the parts men, or have some combination formed with the parts men to prevent them from selling to the small dealers. We feel that it is immaterial to us whether they form a combine or not, as we are pretty certain that we can hold our own with the best of them in regard to quality of goods and price. We think really if they form a combination, we shall find it beneficial to us if we keep out of it, as we certainly would be able to get lots of business that the members of the combination would have to refuse.

COLTON CYCLE CO.

#### Interests Are Too Diversified.

Anything that would lift the bicycle business, or help to do so, from its present condition would be a blessing. Nothing that we can think of can do it further harm, as it has already received all the body blows that in our imagination could come to it. If the idea could be carried out it would steady prices and regulate a lot of existing evils, but we hardly think it feasible, as the interests are too diversified.

#### Strongly Approve the Project.

Without having time to give the proposed combination of bicycle manufacturing interests a great deal of thought, our opinion is this: We know of no trust already formed which would show as good results, on a capital such as proposed, as the bicycle trust, providing all the large makers, or nearly so, are included in it. The saving in the expense of doing business of itself would pay quite a dividend on the capital. It certainly would be a good thing for those entering a trust of this kind if admitted on a proper basis. It would not increase the price of well made bicycles to the consumer, and we are at a loss to see any losers in the formation of such a trust. Vast amounts of money are spent by large makers in self-defense, creating expenses, because competitors do likewise. It certainly would put the bicycle business on a firm basis, so that each year the trade would not be upset at the beginning or during the bicycle season by promiscuous quotations from unreliable houses, who quote in hopes of delivering the goods, but who find they can not after making the contracts or receiving orders.

As to how the combination will affect the bicycle industry and the retail trade, we should say that it would be better for the rider as well as for the maker. Houses like ourselves, who are capable of making large quantities of bicycles, pedals, hubs and all kinds of bicycle parts, would be converted

into the manufacture of what they could do best and most economically; other houses of the same nature would work on what they could do best, and, in consequence, the factories would be running the year around, making parts and bicycles for their own people, instead of making them up in large quantities ahead, before they know to whom they are to be sold. This would probably do away with the manufacture of wheels with antiquated parts, which are put on the market, and which the rider or agent would never be able to find parts for to make repairs. Agents would be shown their samples early in the season and they would be ready to place their orders at any time, which, we think, would be a great advantage to all.

We are heartily in favor of a combination of this kind, providing every concern is admitted on a reasonable basis, and that there is no underwriting or extravagant money paid to promoters on the outside.

Worcester, Mass.

SPEIRS MFG. CO.

#### Makers Could Not be Controlled.

Regarding the proposed combination of bicycle manufacturing interests, we beg to say that we cannot see how a combination of this sort is practical. Manufacturers of bicycle parts and fittings are so numerous that it would be impossible to hold them all in line. They could not be controlled. Furthermore, the manufacture of bicycles can be engaged in with too much facility to do more than correct trade abuses. Any material advance in price, or effort to maintain prices above the natural competitive level, would result in new people coming in. They would get the business, and the members of the trust would find they had defeated the very end they sought to secure. Whether the attempt is made to control the prices of bicycles in general, or of chainless only, the result would be the same.

Very few patents can afford absolute protection, even when the owner of them has unlimited capital with which to fight his case. As there always have been goods of varying qualities for sale at varying prices, so there always will be in the bicycle business as well as any other, and any attempt to restrict production, hold up or advance prices in a business so easily engaged in as the manufacture of bicycles will result disastrously to the trade in the end.

Springfield, Mass.

#### EFFECT UPON ENGLISH TRADE

##### Possibilities Afforded by the Proposed Consolidation of American Bicycle Manufacturing Concerns.

Among the arrivals from England on Saturday last was F. E. Baker, a member of the Cycle Engineers' Institute, who as editor of the Cycle Referee in London made a close study of American methods and products and is better qualified, perhaps, than any other man connected with the trade to express a reliable opinion on the possible effect of the cycle combination on the British industry and its prospects of success in the market. Indeed, one of the objects of his visit is to consult with an American manufacturer who purposes the establishment of a branch in London. Mr. Baker writes as follows:

In order that the possible effect upon English trade, and the probabilities of an extension of exports of American bicycles to that country as a result of a consolidation of American capital and manufacturing facilities, may be fully considered, it is necessary to first arrive at a conclusion as to the dominant characteristics of English trade from individual and collective standpoints.

First in importance must be cited the radical differences between the origin and nature of the factory methods of the two countries. The repetition production of American cycle factories is, presumably, the outcome of the unique developments of the same system of manufacture in the watch, typewriter and sewing machine factories. On the other hand, the practices adopted in the English machine shops are the direct outcome of traditions and experiences of the early school of English engineers. That

means that the shop equipment at first consisted, and in some cases still consists, largely of ordinary screw cutting and sliding lathes, modified of course in some instances by the ingenuity of the charge hands employed. Until recently, and even now in at least one notable instance, the method of production followed was entirely similar to that pursued in English engine practice, where a fitting shop is interposed between the machine shop and finishing department. In this fitting shop the bicycles were assembled in the grey—that is, prior to enameling or plating. When completed, each machine was stripped and the parts numbered; so that when finally assembled after finishing the same set of parts could be located in the same order.

It will be observed that this method was tantamount to the construction of individual machines, and as a natural consequence it was customary to build each bicycle in accordance with each individual customer's requirements and specifications. Traveling men, instead of, as in modern times, starting out to sell a standard output, called upon agents and collected detailed specifications of customers' requirements. This will serve to indicate the manner in which the cost of production of English bicycles has been far in excess of the requirements of the public.

The customs referred to have had another and equally disastrous effect upon the market. The ordinary buyer in England has become the most exacting in his demands, so far as detail of refinement in construction and equipment is concerned, of any buyer in the world. This disposition on his part has been further encouraged by the development of the assembler. This latter is a modern factor in the economies of the English cycle business, and, owing to the progressive policy pursued by manufacturers of parts, there is excellent reason for believing that the aggregate output of assembled bicycles exceeds that of the factory made machine. The parts are produced by repetition methods in splendidly equipped factories, none of which probably is surpassed in America. The parts are better designed, are more elegant and contain more talking points than the products of the average bicycle maker. The English method of construction from machined fittings lends itself to the easy assembling of parts and trivial adaptations demanded by the idiosyncrasies of the builder or customer.

If the foregoing assertions are analyzed it will appear that the only possible deductions from the conditions at present prevailing are: First, that among educated cyclists, as distinct from the new buyer, the demand is such that repetition methods or productions are, if not impossible, at least incapable of being utilized to complete advantage except in the production of parts; second, that a bicycle produced by repetition means will not meet with as complete success in England as in other markets. A superficial study of these statements might lead to the conclusion that, consolidation or no consolidation, the field for the exploitation of American cycles in England will always prove limited. Such, however, would be an entirely erroneous assumption, which fact I will endeavor to demonstrate.

An Englishman will view with equanimity a diminution of home production in any industry, granted that the product itself is cheapened when delivered to the customer, the basis of the argument being that it is advisable to produce only such goods as can be manufactured more cheaply than they can be purchased. Should any given article be produced in a foreign country at a price with which the home producer cannot compete, the latter will gradually divert his energies into channels where they can be more profitably employed in the production of goods which will, either directly or indirectly, be traded for that product which first engaged his attention.

It is at this point that the possibilities afforded by the proposed consolidation of American bicycle companies become apparent. There is in England a huge population, of athletic and healthy temperament but comparatively restricted wage earning capacity, which, at the present moment, offers an unexploited field to men of enterprise who can and will place on the market in sufficient numbers an efficient bicycle to retail at prices ranging between \$25 and \$50. Those figures are well within the reach of American makers, although, at present, almost impossible for the English manufacturers.

It goes without saying that in order to insure success the same must be deserved. The requirements and natural prejudices of the market should necessarily receive strict attention. In that connection one is bound to recognize an exceptional opportunity afforded the proposed company, inasmuch as with the unique facilities at its disposal it would be in a position to employ at least one of its factories on goods expressly designed and exclusively manufactured for the market under consideration.

It is not for the writer, an Englishman with a strong national bias, to enlarge on the possible consequences of such a procedure if backed by ample capital, aggression and organization, but with a knowledge of the facts already referred to, the possibilities appear illimitable.

**PUBLIC REFUSES THE BAIT  
BIG BARGAINS FAIL TO DRAW**

**Sellers of Low Grade Bicycles in Buffalo  
Becoming Desperate—Trying Hard  
to Unload.**

Buffalo, March 20.—Judging from the fairy stories that are being told in the advertising columns of the local press by the concerns selling the cheaper grades of bicycles and the amount of space taken up in expatiating upon the virtues of their respective cycles, trade with these firms is in a very bad way. Meanwhile the public continue to "fight shy" of the much lauded bargain bicycles, realizing the fact, as one man put it, "that something is very much amiss when it requires so much advertising to sell an article for which there is the universal demand that exists for the bicycle."

The advertisement of a recent addition to the retail ranks reads as follows:

This is the time of the year when almost everyone is looking for a wheel, and the fact that — has cut the price on every wheel in his store has set the people thinking and the dealers wondering.

Last week he sold a carload of \$30 wheels for \$17.50 each. This week he has just received a carload of very fine high-grade wheels that sell for \$45 and decided to offer these wheels on Friday and Saturday at the low price of \$26.85.

The dealers will all tell you that they are no good, and that they won't wear. But just remember that we are a responsible house, and that we guarantee every wheel we sell.

Our line is the largest and finest in the city and no matter what dealers tell you, we want you to call and examine them.

We want to sell 3,000 wheels and we want to make just \$3.00 on every wheel, so come and take your choice.

We sell on easy terms.

**Looks Gloomy for Cheap Dealers.**

That the riding public is not to be tempted with the same bait twice, seems to be just dawning upon these people. They are beginning to see the handwriting on the wall now, however, and an epidemic of fear has spread among them and as a last resort the advertising columns of the newspapers are pressed into service with all sorts of ridiculous stories in the hope that the public can be made to believe that "no better" bicycles were ever made and that they are "going so fast" that the supply will be exhausted before dilatory buyers arrive to claim the "bargains."

The following is a fair example of the desperate straits in which the dealers in this class of machine find themselves, and of what may be expected later on:

**A \$50 BICYCLE FOR \$25.**

With Complete 1899 Equipment.—Guaranteed Tires, choice of Gear, Handle Bars and Colors. If you can't spare the cash, we'll give you time. It will cost a trifle more, but it will be a big bargain just the same. \$5.00 down, the balance at \$1.50 per week.

These wheels are going fast. Come quick if you want one. Bring along your 5-dollar bill and take your wheel.

**Buyers Want Quality Now.**

But the people have been through all this before and are no longer tempted by such bait. They know where good, reputable bicycles can be bought and they are not looking for the other kind at any price. Last week the "big store" came out with the announcement that it had already sold 5,000 bicycles of its make at wholesale and that its bicycles were:

**NEW BICYCLES FOR \$25.**

Not old wheels carried over from last year, but new, up-to-date machines of our own manufacture and only just from the factory. For years we've been setting the pace in regard to bicycles—this spring a greater stride ahead than ever before. We insist that we have as good a wheel at \$25.00 as any machine made anywhere at any price.

**Invited to Join the Combine.**

Among the Buffalo makers who have been asked to go into the projected bi-

cycle combination is the Buffalo Cycle Manufacturing Company. George C. Sweet, vice president of the company, when approached on the matter, said: "I am not at liberty to give much information in regard to the combination. It is in an embryonic state as yet, but inside of a week or two we may be better able to give some definite news."

"Have you given an option on your plant?" he was asked.

"Not exactly. We have been asked to go into the deal. It is too early to discuss the details of the plan. There is no intention on the part of the promoters to raise the price of bicycles. The sole object is to reduce the expenses of the business. Only the strongest companies will be invited to go in."

A few other Buffalo makers have been asked to go into the combination. They declined to discuss the question because negotiations had not progressed far enough for them to speak intelligently or for them to give options on their plants.

**Retribution Came Quickly.**

Buffalo, March 20.—Patrolman Schultz of the Buffalo police force shot and seriously wounded the driver of a moving van last Friday. Schultz and his wife were run down, while riding their bicycles, by the van driven by the injured man, which was racing with another van. The patrolman, who was in citizen's attire, attempted to arrest the driver for violating the city ordinances, and was struck on the head with a piece of gas pipe used for moving pianos, making a six-inch scalp wound. The officer was knocked to the ground, and while in this position drew his revolver and shot the driver.

**Overman Declines to Talk.**

Springfield, Mass., March 20.—A. H. Overman, president of the Overman Wheel Company, when seen by a Cycle Age representative regarding the proposed trust of bicycle makers, refused to discuss the matter. He declined to state whether or not he favored a combination of makers such as is reported to be in progress and also to give any information as to whether the Overman company had been approached in the matter or not. Just now, he said, he was intensely interested in his motor vehicle.

**Week's Exports from New York.**

Exports of cycles and cycle material from the port of New York for the week ending March 14 are recorded as follows:

	Bicycles.	Materials.
Germany .....	\$17,836	\$ 4,882
France .....	15,320	4,358
Denmark .....	10,291	2,256
England .....	11,307	1,557

Totals .....	\$94,397	\$32,593

Austria's production of cycles rose in 1898 to 70,000 machines. Her exports increased 69 per cent. over the previous year, and the imports 37 per cent. for the same time.

**COMPETING WITH THE SPECIAL  
PROFIT IN BUILDING TO ORDER**

**Dealers can Retain Trade and Make Repair Department Pay by Catering to Customers' Whims.**

Great inroads into the retail bicycle business have been made by the Repair Shop Special. The business done by the small repairmen in these "bicycles built to order" is inconsequential in individual cases, but amounts to considerable in the aggregate, a fact that is readily apparent from the great volume of business done by jobbers of fittings and supplies in catering to just this class of trade. The repairman has been able to divert this current of trade to himself by building to suit the personal preferences and whims of the riders without making exorbitant charges for such special work, being enabled to compete with the larger builders possessing better facilities and obtaining lower prices on material and equipment by placing a low valuation on his time.

**Can Be Made a Source of Profit.**

While this repair shop building was in its infancy it was ignored by the regular agent and dealer in standard machines as too insignificant to be worthy of attention, but since it has grown to such large proportions regular dealers have begun to take cognizance of it and to think that if there is money in it for the repairer it should afford a profit for the dealer also, who enjoys a greater prestige, is more favorably located and has larger resources at his command, and that in the work of building special machines to order may be found the solution to the vexed question of how to make the repair department pay expenses. As the dealer is under the necessity of maintaining a repair shop in conjunction with his store, the labor, space and tools that are otherwise idle a portion of the time and unproductive of returns, could in this way be made profit earning, while at the same time the dealer would be combating a steadily growing competition that is cutting into his own trade.

In several of the larger cities, where 75 to 100 of the special makers present a style of competition that is hard to combat, some of the dealers have adopted tactics that would seem to offer a satisfactory solution of the matter. This consists of meeting the repairman on his own ground, and when a customer is found who insists upon having a "special" they make it for him.

**Large Makers Recognize the Demand.**

The lower prices on standard machines this year and the general tendency of manufacturers to include 30-inch wheel machines and other unusual constructions that have before come under the head of "specials" in their lines, have brought the business to a point where many makers of special machines see the futility of competing. As a consequence these assemblers have taken the agency of one or more lines and will give the selling portion of their business more of their attention than the manufacturing. Particularly is this so in the smaller towns, where the "special" maker never has thrived as well as in the big centers.

**Converts to Fast Freight.**

To the Editor:—We are in such hearty accord with the protests against the exorbitant charges of the express companies and with the proposal to use fast freight that we now use the latter whenever we can.

Indiana.

STEWART BROS.

Cyclists in an Austrian town have been forbidden to hold meetings in order to protest against the cycle tax imposed.

# EXPERIMENTAL STORE LIGHTING

## Satisfied User of Acetylene Gas Volunteers Facts for Retailers—Points in Its Favor

To the Editor:—The last editorial paragraph in the Cycle Age for March 9, anent the "Cost of Illuminating Stores," reflects with noteworthy timeliness the lack of exact and satisfactory knowledge upon the subject named among the great majority of retail cycle dealers, and presents an opportunity heretofore less directly and broadly offered by a representative publication of its class for the contribution of individual opinion and experience to the trade's discussion of illumination and illuminants. The matter is of prime present and future importance, not only to the retail wing of the American cycle industry, but to nearly every branch of general merchandizing. That further-extended consideration should be bestowed upon the question of illumination by those whose business makes them the majority among the readers of your paper is evident, since sales of a great many bicycles and sundries are made in the evening—especially in the smaller towns and rural districts. I herewith contribute my experience with acetylene. W. P. H. Boston, March 17.

### Nature and Properties of Calcium Carbide.

In detailing an individual experience with acetylene gas for illuminating purposes in cycle stores, it would be prejudicial to clearness and completeness to take for granted an exact knowledge on the part of the retailer of all the facts concerning the nature and operation of this latest gaseous product, for there are many districts far from the large cities where acetylene and its application are known by name and in theory only.

Acetylene gas, though it has been known to chemists for a long time, is in the practical sense new, since the method of producing calcium carbide at a cost which permits its common use was discovered only recently and by accident. As this compound has very marked advantages over what is familiarly known as "gas," it has been coming very rapidly into use during the past twelve or eighteen months. In its normal condition the carbide is grayish black in color, having a roughish surface of apparent porosity, and resembling gas coke in appearance. It is a very unstable compound, having a greedy affinity for moisture, which it will absorb from the air unless kept tightly closed.

The action of water upon carbide is in reality a double decomposition, each disturbing the other; the carbide has its carbon separated from the basic calcium, and the water in turn has its oxygen and hydrogen separated, the reason being that when the four are brought into company, each of them finds a new association which it prefers to the old and promptly "dissolves" in order to reunite. The carbon of the carbide and the hydrogen of the water seize hands (figuratively speaking), forming the hydro-carbon gas known as acetylene; the calcium in the carbide joins the oxygen of the water to form the residuum of slacked lime, the apparent character of this refuse depending on the proportion of water used.

There are several apparatuses for bringing water and carbide together. These are broadly distinguished as "wet" and "dry" generators. In the former, a small quantity of carbide is brought into a large quantity of water; in the latter, the water is allowed to come periodically in small quantities into contact with a maximum quantity of carbide. Each method has its evident advantages and disadvantages, its advocates and its opponents. Sometimes the gas pressure itself is made to automatically regulate the flow of water to the carbide, by opening and closing the channel through which the water flows;

sometimes the pressure—in "wet" generators—is made to regulate the periodical dumping of small fixed charges of carbide into a mass of water; again, the pressure is made to open and shut the water-supply cock; sometimes there are reservoirs or gasholders, and sometimes (especially when the apparatus is on a small scale, as in a bicycle lamp), the gas is consumed as fast as made.

### Description of Generator.

When the writer installed an acetylene gas generator more than a year ago, the project was in the nature of an experiment, or ticklish venture, and the former means of illumination was retained for use in case of emergency—which has, however, as yet failed to materialize. The Criterion Automatic generator, manufactured by J. B. Colt & Company of New York city, was chosen. The type was that listed at \$100, No. 20, the dimensions being: Height, 6½ feet; floor space required, 3x5 feet; number of ½-foot burners, 25; charge of carbide, 20 pounds.

The following additional information is carefully condensed from the com-

pany's circular which prompted the purchase and trial of the machine—a description which is doubtless, in its essential features, typical of first-class generators as a whole: This generator consists of a stand for carrying the carbide holders, and a gasometer for regulating the supply of water, keeping the gas pressure constant and taking care of the surplus gas. (See plan diagram.) A condenser for cooling the gas is at the base of the gasometer. The water-regulator is placed on the side of the gasometer, from which the water supply is taken, except in very large generators, in which a separate water tank is used. The carbide holders are made in various sizes and are attached to the stand by pipes which radi-

ate from a central upright, but each holder is on a different level from the others; four, eight or twelve of these holders, according to size, can be conveniently arranged in sets of four, one set above the other, the gasometer being of the same capacity for any number of holders of a given size. The gasometer is of the capacity best suited to the number of burners and the size of the carbide holders. A suitable blow-off is provided in case the gasometer should rise too high, thus allowing any extra gas to pass off outdoors. This, however, rarely occurs. The condenser has ample surface for cooling the gas, and its size is large enough to allow the products of condensation to accumulate for some time; they can then be conveniently removed by means of a stop-cock. The water regulator is especially designed so as to move with the greatest ease; it is perfectly free from sticking, and leakage is prevented by having double openings, so that two leaks must occur at the same time before any water can get into the carbide holders when the regulator is off. The latter is so arranged that in case of a large leak of gas, or in case more burners are used than the generator is intended for, it will shut off the supply of water, and electric contact can then be provided so as to give warning of the fact.

### Observations on Results.

The generator was placed in the cellar immediately under the store, and careful and studious attention was given to the directions sent with it. I was much pleased to discover that no especial knowledge was required for its operation, and that in fact only a few minutes' care at the most convenient time during the day was sufficient to prepare for an evening's lighting. The system was absolutely clean and not troublesome; and soon it became a permanent instead of an experimental part of the store.

The gas was found to be of light specific gravity, as gases usually are. Its photometric gauge—or degree of intensity of its light—is very high, making it the most powerful illuminant yet known, the electric arc excepted. It burns almost without smoke or residuum and is intensely white, being as white as the electric arc, or as ordinary gas when used with the Welsbach mantle at its best; and, like both of them, the acetylene light is unpleasantly strong to the eyes when directly faced. It is poisonous to inhale, but its peculiar odor gives instant warning of its presence. This odor impresses different people differently. Some are exceedingly hostile to it, but the writer (who has handled carbide considerably) finds it much less disagreeable and noxious than ordinary natural or artificial illuminating gas. Strange to say, its flame is less hot than that of ordinary gas; on the other hand, the decomposition of the carbide produces heat. This is so noticeable that merely rolling a handful of carbide lumps about, with no moisture present but that ordinarily in the atmosphere, will soon produce the sensation of warmth by the oxidation of their surfaces.

### Some Objections Answered.

Many objections are still urged against the use of acetylene gas. The most common one is, of course, that it is dangerous, which it certainly is—so is every other gas or illuminating agency. It is explosive, when mixed with air in cer-

You May  
Know  
Them

**W**HEN you see an attractive saddle you generally look for the name of the maker, and nearly every time you find that it bears one or another of the familiar stamps here shown.

A saddle to be satisfactory must have beauty, style, durability and correct shape. These attributes are absent unless the goods are manufactured by experienced workmen under the supervision of men who make a study and have a thorough knowledge of the business, and who have the capital and the facilities to put together the finest materials in the best manner known to the art.

The American Saddle Company makes saddles that *satisfy*.

The evidence of it lies in the fact that such an overwhelming majority of the riders buy them, ride them and believe in them.

It is safe to trust the judgment that is so nearly universal and be governed by it in laying in your stock.

Buy the products of the American Saddle Company and you will need few others.

**American  
Saddle Company**

American Trust Building

Cleveland, Ohio

tain proportions, but so is any hydrocarbon. The most ready and natural use of it is in isolated places where other gas is not available or is excessively costly, in which cases it is an easy matter to pipe a house or a store and install a generator in the cellar or yard. There is a choice of generators and a choice of positions for placing it. The generator is hardly supposed to have been perfected yet, and the subject is still in course of evolution as to its underwriting hazards. It is unnecessary to go further into the details of generating plants, but one broad and eternal warning should be observed with all—namely, use intelligent care, not fear, when handling acetylene gas. Say to yourself concerning a generator as you would to a customer concerning a lamp working on a smaller scale, though on much the same principle, "Whoever wishes to try it should begin not by being afraid of it, but by using a little care and patience to understand, at least, the instructions for use."

**The Matter of Cost.**

As to cost, my experience leads me to believe that acetylene gas, after the plant has once been installed, is the cheapest of all satisfactory lights for dwellings or stores. The following tables are clipped from the already named circular of J. B. Colt & Company. The percentages of savings named "in favor of acetylene" are of course, inspired to the superlative degree by the natural enthusiasm of its makers seeking to awaken the utmost interest in their products. Divided by 2, however, my experience leads me to endorse the percentages as being, in my opinion, practically correct. "So-much-a-night" calculations are not reliable and show such striking variations as are noted in the paragraph in the Cycle Age which called forth this response. Having established the fact of its cheapness over other forms of lighting, its friends can afford to rest their case in that particular and leave the verdict to be rendered by individual judgment.

**Store Lighting Without Cost.**

To the Editor.—We have experimented with several lighting methods, including a number of acetylene gas generators, which did not give satisfaction, but we have a generator now that pleases us. It gives no trouble, as it works automatically and needs no chimneys, mantles or fixtures and it costs only half a cent an hour to run a half foot burner, which makes a beautiful light.

We purchase our calcium carbide very cheap and expect to purchase carbide for less than half what we are now paying, which would make the expense of lighting in proportion to the price of carbide. We sell large quantities to riders who use gas lamps. We make more than a double profit and figure that our lights do not cost us anything, as the extra profit on carbide more than pays the expense; in other words, the profit on carbide would soon pay for the generator, which can be bought at dealers' prices by taking the agency.

Any party buying acetylene gas generators will expect to purchase their carbide from the dealer, and through the sales of generators and carbide dealers will make more money than they can in handling bicycles, as there is a demand for better and cheaper light.

Indiana. POWER CYCLE CO.

**Grand Rapids Dealers Adopt List.**

The dealers of Grand Rapids, Mich., have entered into an agreement to regulate prices for the season. Nearly every dealer in the city has signed the agreement. Among those whose names are found on the list are: Heth Bros., Jarvis & Daniels, Perkins & Richmond, Grant &

Co., W. F. Stadel, A. M. Maris, C. J. Bronson, Beelbee & Phippen and about twenty others. The selling prices of chains, sprockets, seat posts, nuts, pins, guards, etc., will remain about the same as last year.

The list of the prices which have already gone into effect has been printed and will be hung up in all the shops in the city. Charges for the most common repairs are as follows: New quick repair double tube tires, put on, \$7; pair plain inner tubes put in, \$3.50; new casings put on, \$2.25; valve and stem, 25 cents extra; punctures repaired, 25 cents and up; vulcanizing, 50 cents and up; respoking one wheel, \$1.50; single spoke put in, 5 cents; straightening fork, 35 cents and up; new fork stem, \$1.

**Low Range of Trading-In Prices.**

Trading-in prices on second-hand machines will not range high in Chicago this season if the figures quoted by one of the leading agencies in the city are to be taken as a criterion. On the best high class machines the maximum limit will be \$12, it is said, and this amount will be allowed only on a machine of last year's production which has had the very best of care. From this figure the prices will range down to \$5, below which nothing will be handled. No second-hand machines will be accepted in exchange on chainless models, which must be paid for in cash. On all other models trades will be made. Orders for twenty chainless machines have already been booked by this one agency and in all cases the purchase has been for cash.

**Indianapolis Dealers Reorganize.**

The Indianapolis Cycle Trade Association has been reorganized, the following officers being re-elected: President, Thomas Hay; vice-president, C. G. Fisher; secretary, Frank Staley; treasurer, F. I. Willis; directors, Arthur McKee, E. S. Sterne, Frank Bissell, Conrad Mueller and John B. Orman. It was decided to keep the stores open at night until the summer months set in. The matter of giving sundries to purchasers of machines, the question of credits, and other matters of interest to the trade, were referred to an executive committee. The general expression of the dealers at the meeting was one of confidence in an excellent season.

**German Gas Lamp Prices to Rise.**

According to the report of a German contemporary, the prices of acetylene lamps will increase, on account of a rise in the prices of the material, especially brass, the price of which has increased 50 per cent., while the metal used for brazing is now 60 per cent. dearer. The latter, however, will make little difference as the quantity used is small. German manufacturers have already taken steps for combined action looking to increasing the price of lamps.

**Replevin Against Eck and Johnson.**

H. A. Lozier & Co. began an action in replevin in the district court at Minneapolis last Thursday against Thomas W. Eck and John S. Johnson to recover possession of twenty-two bicycles, tandems and triplets, etc., the value being placed at \$1,500. Stiles & Stiles, attorneys for the plaintiffs, state that Eck had stored a portion of the machines with Johnson, who was unwilling to give them up without an order from Eck, which accounts for Johnson's connection with the case.

**Savannah to License Dealers.**

An ordinance has been passed in Savannah, Ga., making the payment of a license compulsory on "dealers in bicycles and

supplies and repairers of bicycles." This includes all dealers engaged in the sale of bicycles in the city and was passed as a counter move against the new state law requiring bicycle companies in the state to pay a tax for each agent handling their machines, which is held to relieve the dealers from municipal taxes.

**Germany's Excess of Exports.**

According to official statistics, the exports of German bicycles for the first nine months of 1898 amounted to \$3,010,700. The same exports for the corresponding period in 1897 were \$2,094,400. It is estimated that the exportation of German bicycles exceeds the importations by about 50 per cent. From this it would appear that the demands for an increase of the present tariff to benefit German manufacturers are not well grounded.

**Favor Cycle Tax for Sidepaths.**

Pennsylvania wheelmen are interesting themselves in favor of the passage of the bill recently introduced in the legislature providing for a tax on bicycles to construct cycle paths along public highways. County organizations and individual wheelmen are using their influence with members of the senate and house to effect its passage. A monster petition is to be circulated among wheelmen of the state as a memorial praying for the passage of the act.

**Stranded Troupe of Poor Cyclists.**

The Girl from Paris theatrical company stranded in Toledo early last week. Six members of the troupe had been provided with Columbia chainless wheels for use on the stage, and when they found themselves without work or money they sold them at "bargain rates" to the local Columbia agency.

**English Exports for One Week.**

Cycle exports from England for the week ending February 24 are recorded as follows:

Adelaide . . . . .	\$ 820
Aden . . . . .	235
Albany . . . . .	345
Alexandria . . . . .	35
Auckland . . . . .	760
Bombay . . . . .	4,710
Boulogne . . . . .	2,055
Bremen . . . . .	320
Calcutta . . . . .	1,575
Cape Town . . . . .	400
Durban . . . . .	1,240
East London . . . . .	750
Flushing . . . . .	2,085
Foochow . . . . .	160
Freemantle . . . . .	100
Ghent . . . . .	780
Hamburg . . . . .	45
Hobart . . . . .	225
Hong Kong . . . . .	460
Kurrachee . . . . .	35
Madras . . . . .	575
Marseilles . . . . .	35
Mauritius . . . . .	500
Melbourne . . . . .	10,445
Mombassa . . . . .	185
Mossel Bay . . . . .	515
Nelson . . . . .	50
New Plymouth . . . . .	30
New York . . . . .	275
Oamaru . . . . .	120
Ostend . . . . .	60
Otago . . . . .	100
Penang . . . . .	700
Perth . . . . .	1,750
Port Elizabeth . . . . .	1,290
Shanghai . . . . .	295
Singapore . . . . .	110
Sydney . . . . .	360
Total . . . . .	\$34,530

A bicycle dealer in a Massachusetts town is openly offering to every purchaser of a machine a reduction of 10 percent of his list price as well as a similar commission on all machines he may induce his acquaintances to buy.

The municipal council of Leipsic has voted \$4,500 to establish good cycling roads round the town.

## COMMERCE IN FOREIGN MARKETS

### OUR BICYCLES POPULAR IN INDIA

English made cycles are distinctly the most popular in Calcutta among the better class of riders, although the Americans are pushing their machines very strong. Owing to the competition of Indian society, the appointment of Lord Curzon as viceroy is not altogether an unmixed blessing to the English cycle trade. The nationality of Lady Curzon is causing a run upon everything American, and just at the moment the American firms are getting a better chance than they have had before. Still, there is always the innate affection for England and things English, and, while the feeling may perhaps give the trade in American machines a spurt, as long as English makers maintain the quality of their goods they will be able to secure the bulk of the trade in India. The demand is for light machines, not necessarily cheap, but the lighter the better; and more than that the demand is growing. Makers should be careful to mark their prices in Indian currency, and make an allowance for variations in the rate of exchange.

### CARRYING SAMPLES IN SOUTH AMERICA

The carrying of samples in the South American market is a question of considerable importance, especially if the traveler wishes to cover an extensive territory. Indeed, the extra cost incurred during a limited trip through Argentina, Uruguay and Brazil by a mistake in this particular will increase one's expense account greatly.

In many foreign countries it is permissible regularly to bond the samples of a commercial traveler for a limited period, the obligation of the bondsman being released when the samples are cleared intact at the original port of entry. In Brazil the custom house authorities will not allow any such procedure. The traveler there must pay the regular duties on all samples which are in a salable condition, and he must be careful or he may be obliged to pay the duties more than once, or be put to considerable delay and expense in having the matter rectified.

Neither can travelers' samples be bonded in Uruguay. The traveler will find the Uruguayan custom house authorities more liberally inclined than in Brazil, and with the aid of an influential broker privileges can be secured which otherwise would be impossible in that country. Montevideo being the only custom port of entry of importance in Uruguay, there will be no occasion to prove that duties have been paid in another port of the same republic. Such samples as are required may be taken out of customs and the balance placed in storage until ready to leave; or should only a very limited number of samples be needed as a test of their possible sale, the authorities will allow them to be selected and passed through without charges if the valuation is small.

At Buenos Ayres, in Argentina, both the laws and those who carry them out are very liberal in this particular. By signing a solicitation after landing, indorsed by any local business firm registered in the municipal books as taxpayers, the traveler can have the free use of his samples during a term of from thirty to ninety days under a bond equal to the amount of the duties. Should the use of the samples be desired for a longer period, it is possible to have the bond

extended by making the proper application. The signer of the solicitation therefore becomes the bondsman and he would be held responsible for the amount of the duties should the samples be sold in the Argentine without notifying the authorities or should the traveler fail to report their clearance for another country. It is necessary that the work of securing these privileges be done by a custom house broker, as the application must be signed by many officials in various departments and go through a tiresome routine which an inexperienced person could not find out in a month's time. There are several custom house brokers in Buenos Ayres who will both sign travelers' bonds, put the application through and afterwards release and clear samples for a fee equivalent to about 5 per cent of the value of the goods.

The bonding of samples in the Argentine has the disadvantage of being a slow process, often requiring ten days from date of disembarkment before the goods are delivered into the traveler's possession. By paying the duties outright usually six days can be saved. It therefore resolves itself down to a matter of arithmetic, i. e., whether the duties to be assessed amount to more than a six days' hotel bill and expenses in addition to 5 per cent brokerage commission on the valuation of the samples. In favor of the bonding process it may be stated that the additional time can readily be well expended in making the acquaintance or interviewing the trade and thus gradually bring them up to the purchasing point—a matter which requires considerable time in any part of South America.

### THE BICYCLE AMONG NATIVE AFRICANS

In the border towns of Cape Colony, such as King Williamstown and Grahamstown, the native Africans have for many years taken their share in all branches of athletics, but it is only recently that they have added cycling to their other accomplishments, and the first native who had sufficient nerve to ride through the town on his wheel created a big sensation. When, however, the same fellow, faultlessly attired in regulation knickers, made his second appearance, and this time accompanied by a native lady, the excitement became intense, and the local paper devoted a column to the incident. This occurred about eighteen months ago and since then the number of Kaffirs who cycle has increased by leaps and bounds.

The Kaffirs in King Williamstown and Grahamstown now have their own cycling clubs, and on Saturdays and Sundays they may be seen taking jaunts into the neighboring country.

In Natal, there are now three native clubs. When these were first established they met with strong opposition from the Europeans, for the Natalian does not believe in allowing the Kaffir much liberty. However, this feeling gradually diminished, and the Natal Kaffir now stands on a footing with his colonial brother so far as the bicycle is concerned.

In Zululand the wheel has also caught on, and many of the missionaries own machines. Several of the native teachers, too, have bicycles on which they visit the members of their congregations. For this state of affairs Zululand has to thank a speculative Australian, who traveled into the country on his bicycle and took orders at all the trading stores and mission stations he came across. It was a most successful venture, and after he re-

turned to his native country the seed he had sown took firm root, and the bicycle is as much appreciated in Zululand today as it is in any more enlightened country.

The South African native is of a thrifty disposition and puts by every penny he earns, and those who turned their attention to cycling were sufficiently well provided with funds to supply themselves with the necessary outfit. The machines used by the natives are, as a rule, the best that can be obtained, as one individual of a speculative turn of mind, who invested in a stock of broken-down machines which he tried to unload on the unsophisticated natives, found to his cost. The Kaffirs would not even look at his goods, and at length in despair he deposited his goods in an empty shed for "safe keeping" and shook the dust of the too enlightened town from his feet.

An attempt was made about nine months ago by two Kaffirs of unusually adventurous disposition to introduce the bicycle among their brethren in Johannesburg. The result was not all that could have been desired, from the natives' point of view at any rate, as the first policeman they encountered promptly put a stop to the proceedings by knocking the "darksies" off their machines, and then taking the machines into the charge office. The bicycles were eventually returned to their owners, but they were given to understand that cycling was not for such as them but for their betters, and were ordered not to transgress in this way again.

### BICYCLES IN GUADELOUPE

In the island of Guadeloupe a possible opening presents itself for the sale of American bicycles. There is now under construction in the principal public square a bicycle track, at the city's expense. The duty on French bicycles is 25 francs paper, or about \$3.80, each; on American bicycles, 50 francs paper, or about \$7.60. The freight on a bicycle from Paris amounts to about 65 francs gold, or about \$12.40, while from New York the freight is from \$1 to \$2 each; thus leaving a good margin for the American machine. The French machines are of a grade that permits them to be retailed for a cash price of 350 to 400 francs paper, or from \$53 to \$60; but the usual mode is to sell them on monthly instalments of 10 francs, or \$1.50, charging from 450 to 500 francs in such case, or from \$68 to \$75.

Sales of a medium-priced machine could be made here. Bicycles should be light, strong, showy, and of good workmanship. Probably the best way to introduce them would be to send a certain number of machines, packed six in a crate, in light crates, to some reputable merchant, allowing him to sell them on instalments of, say, \$3 a month.

### AUSTRIAN CYCLE IMPORTS INCREASE

The Austrian customs authorities have just issued returns relating to the imports and exports of cycles during the past year. They show that the imports into Austria during 1898 amounted to 4,494 machines, valued at \$287,616, as compared with only 2,190 machines valued at \$266,240 in the preceding year.

The exports show a somewhat irregular result, the number of machines having increased, while the value has decreased. The total for 1898 is 8,625 machines, of an aggregate value of \$345,000, as against only 8,160 machines, but of a value of \$366,000 in 1897.

## SAGER GEAR AND FITTINGS

### Four Popular Forms of Bicycle Gear—Generated Gears and Roller Gears—Design of Fittings

The four principal forms of power transmission gears which will be in more or less general use during the coming season are the chain and sprocket gear, the bevel gear, the Sager gear and the various roller gears. The last named form a class to which the Sager gear does not really belong, although it is provided with roller studs in the form which it is before the public and is commonly called the Sager roller gear. There is the important difference, however, that the Sager gear would run almost as well without rollers as with them. The rollers do not belong to its constitution but merely compensate for such inaccuracies as are inseparable from all practical manufacture.

A gear wheel with fifteen teeth may be designed with such curves on its teeth that it will roll perfectly in mesh with, say, another gear wheel with fifty teeth, but if it were brought in engagement with a third gear wheel with twenty teeth, though the pitch be the same, the curves on its teeth would be slightly inaccurate. Straight faced gear wheels and bowl faced gear wheels do not possess their boasted scientific accuracy and perfect roller motion unless they are mated. They should be made and sold and used in pairs.

A change of gear in a bevel gear bicycle or a Sager gear bicycle should be accomplished by changing two gear wheels; one is not sufficient.

#### Line Contact in Generated Gears.

It is the characteristic of scientific gears that they are generated by the action of planers or cutters which imitate the motion of the intended mate for the gear. The form of the teeth is not

Fig. 1—Hanger Mechanism.

arbitrarily chosen, as is the form of the teeth in real roller gears, but is the result of the abrasion caused by a milling cutter which is gradually brought into the same relations to the gear blank as the teeth of the mating gear would hold.

The contact in such gears is therefore line contact. In true roller gears the contact is point contact, more or less

obscured through the choice of form of the rollers.

It is another characteristic of the generated gears that they do not become absorbed and inoperative when their angles are near to the limit. The bevel gear blends into a spur gear as the angle approaches zero and into a crown gear when the angle approaches 180 degrees. The Sager gear is a straight faced cam meshing with a pin gear at one extreme, and at the other limit again merges into the same form. The intermediate stages represent the

Fig. 2—Showing Shaft, Pinions, and Frame.

Sager gear as it is known, which is generated by rotary corrugated cylindrical cutters eating their way into a blank while both the blank and the disk holding the series of cylindrical cutters are revolved on their respective axes in contact with each other and without slip.

The rollers on one of the interacting pinions of the finished gear need not revolve in order to mesh properly, if the rotary cutters have done their work, but they serve the useful practical purpose of permitting a very close adjustment of the gear in the bicycle so that the backlash, or play between the gear teeth, may be reduced to a point where vibration and chattering ceases.

#### The Waltham Company's Design.

The application to bicycles of the Sager gear was brought most prominently before the public when the world's mile record was lowered on a machine which was provided with this gear and was designed by the Waltham Mfg. Company especially for this gear.

The Imperial Company of Boston has since then undertaken to market and eventually manufacture the gear fittings of this patented design as shown in the accompanying illustration and The Cycle Age is indebted to this company for the opportunity to sketch the parts and thus give the cycle trade at large the first public presentation of the construction.

To enter into all the minor details of this construction would be superfluous and tedious. In this progressed stage of cycle manufacture it is a matter of course that bearings, locknuts, washers, etc., are employed by every first class manufacturer in accordance with best usage in various places where they obviously belong. The following description has therefore reference only to those features which must be specially mentioned in order to understand the workings of the construction.

#### Front Portion of Mechanism.

In Fig. 1 is shown the crank shaft mechanism with the toothed driving gear secured to it, and below it the aluminum

casing which encloses the gear wheel and the roller pinion on the front end of the driving shaft.

The aluminum plate which slips on over the crank and closes the face of the casing, is left out in this illustration as well as in Fig. 4. It is simply a flanged plate with a circular opening for the crank boss and abuts against a felt ring on the face of the gear wheel.

The construction of the crank shaft will be recognized as essentially the same that is used in Orient bicycles. Before the crank shaft is inserted in the hanger, the gear casing is placed in position on the latter and secured by three screws, the holes for which are plainly indicated in Fig. 2 in the three lugs extending from the band which surrounds that end of the hanger and carries the double fork arms. The casing for the roller pinion, being in one piece with drive wheel casing, is at the same time pressed into its position to the rear of the ball-bearing in which the driving shaft front cone is

received. In this position the case abuts against a flange on the fork arm fitting. A lid covering the rear end of the case is shown resting against the shaft in Fig. 2.

Longitudinal adjustment of the front pinion on the shaft in relation to the drive gear wheel is secured at the factory and may in any emergency be readjusted as the pinion is threaded on a sleeve brazed to the side shaft.

The ball cups in the hanger are firmly connected by a sleeve surrounding the shaft, and the left cup is threaded in the hanger so that when it is screwed in or out the cup on the gear side follows.

Fig. 3—Rear Hub and Axle.

By this arrangement the lateral adjustment of the crank shaft gear in relation to the side shaft pinion may be regulated, independently of ball-bearing adjustment which is accomplished by the adjustable cone on the left end of the crank shaft.

At the hanger it is the lateral adjustment which is the most important, and at the rear hub the longitudinal adjustment, and these are therefore the adjustments which are placed most readily

# FINISH....

The finish of the '99 BARNES BICYCLES is in keeping with the excellent material, mechanical features and improved methods used in their construction.

The white enameled frames with royal purple steering heads and fork crowns have set the fashion for the year. ❁❁❁

## RIDE THE ELEGANT BARNES

The Agency for  
the Barnes is a Valuable One.  
Write Us.

THE BARNES CYCLE  
COMPANY

SYRACUSE, N. Y.

within reach of the rider. Longitudinal adjustment at the hanger and lateral adjustment at the hub are never vital to the running of the gear.

### Rear Part of Gear.

The rear pinion is a toothed gear wheel smaller than but otherwise similar to the drive gear. It is bored out to receive a bearing cup and balls. This bearing, like all the other ones, is provided with a ball retainer.

When the front cone upon the driving shaft has been inserted in its bearing, bringing the front pinion into its casing and its rollers in correct mesh with the crank shaft gear, the rear end is adjusted by means of the cone which operates in the rear bracket as shown in Fig. 2. This cone is a solid piece of cylindrical steel, cone shaped at the front end, and screw threaded in a bearing sleeve that forms part of the bracket. At its rear end it has a square hole into which fits a lug on the wrench which is furnished with each set of gear fittings. A lock nut is threaded onto the rear end of the cone piece and bears against the sleeve.

The double fork arm and the right upper stay of the bicycle are brazed to the bracket piece, and the two screw holes, above and below on the bracket indicate how the rear gear casing, shown in Fig. 3, is fastened.

### Rear Hub and Axle.

In Fig. 3 are also shown the rear hub with its gear and the rear axle. In the hub is noticed the cup-shaped extension of the right spoke flange. By adopting this design a double object has been attained. In the first place it makes it possible to spread the spokes on the gear side just as much as on the other side, so that the wheel is not flatter on one side than on the other, and secondly the cup-shape protects the junction where the

hub revolves in contact with the circular edge of the gear case against mud and water. A felt washer is further used to render this junction dustproof and when this felt washer is of the right thickness to bring it in contact with the edge of the casing, the protection at this difficult point should be very efficient.

### Dust Proof Casings.

Dust proof casings are among the most important properties of chainless bicycles. Where revolving parts are not in contact, as where the casing shown in Fig. 3 are screwed against the rear bracket, as shown in Fig. 4, or where the axle pierces the casing, the dust is readily excluded by the use of a little rubber solution at the meeting edges. Where

Fig. 4—Assembled Mechanism, Minus Forward Face Cover.

there is a rotary contact in these Sager gear fittings—at the hub—the two shaft ends and around the crank boss the forms of the meeting edges have been adapted to produce good protection against anything but fine dust, and felt washers saturated with thick oil are used for excluding the dust.

### The Clamping Sleeve.

To the right hand end of the axle is permanently secured a clamping sleeve, as seen in Figs. 3 and 4, by which the axle is secured to the bearing sleeve carrying the rear shaft cone. This clamping sleeve is at an angle with the axle corresponding to the angle of the driv-

ing shaft, and can be adjusted in and out on the sleeve so as to bring the hub pinion in exactly correct relations to the shaft pinion, longitudinally. The adjustment is accomplished by a differential screw-bolt which enters into a threaded hole in the bracket with its coarse-threaded front end while the fine-threaded portion operates through the upper lug on the clamping sleeve. Screwing the bolt in, therefore, draws the axle nearer to the bracket and brings the gear in closer engagement. Lateral adjustment is provided by the manufacturer and need never be tampered with. In case of necessity it may, however, be easily accomplished by adjusting both cones on the axle.

When the clamping sleeve is in posi-

tion on the cone-bearing sleeve of the bracket the axle remains automatically parallel with the crank shaft when the gears are adjusted, but it must of course be observed that the axle nut on the opposite end is left loose while gear adjustment is made, so as not to strain the parts. Similarly the clamping screw at the extremity of the clamping sleeve must not be tightened till adjustment is made, lest the thread of the differential screw should be stripped. With these simple precautions the adjustments are readily made by any intelligent rider, the order in which they are mentioned in this article being observed.

## CHANGEABLE BEVEL GEAR

### Jocelyn's Construction of a Bevel Gear Bicycle with Two Speeds and Neutralized Lateral Strains

As a result of the studies and work of A. H. Jocelyn of 319 Hancock street, Brooklyn, N. Y., a new bevel-gear bicycle construction has passed the scrutiny of patent examiners and has been launched on the market with seventeen distinct claims to novelty and merit, which may be summed up in the following objects which it has been the aim of the inventor to realize: To remove lateral strains from the front bevel gear and free the crank shaft from stresses due to this cause, and thereby be enabled to construct these parts much lighter than in other bevel-gear bicycles; to connect the driving power with pinions on either side of the rear hub and thereby produce a changeable gear; to mount and adjust all of the gearing independently of the bicycle frame, to provide a compensation for wear of gears and bearings; to make the gears more readily accessible than in other chainless machines while yet protecting them against dirt and dust; and by the same construction facilitate repairs.

Mr. Jocelyn places his invention at the disposal of manufacturers on the royalty plan.

The accompanying illustrations show the construction as follows: Fig. 1 gives a horizontal cross section through the bearing parts. Fig. 2 is a side view of the lower end of the frame bars with the parts of casings which are attached thereto. These require no special explanation. Fig. 3 is a side view of the gear boxes, which are attached to the casings. Fig. 4 represents the clutch shifter employed to change the power transmission from the pinion on one side of the hub to that on the other side and thereby change the gear.

#### Guard Flanges—An Innovation.

The crank shaft bevel gear is central and double-faced meshing with pinions on both sides, and the inventor provides guard flanges extending to the pitch lines of the teeth on all the pinions and intended to roll in contact. These flanges working upon opposite sides of the large gear entirely balance the lateral strain upon the gear and prevent end thrust upon the crank shaft.

The inventor does not mention that any special material is to be used for these flanges which it may prove somewhat difficult to machine so accurately for use in a bicycle if steel or other metal is used, that the projected rolling contact will be uniform and continuous.

#### Change Gear Mechanism.

To operate the changeable gear each of the rear pinions is fitted movably upon the hub and provided with notches, and the hub has clutch teeth upon which the notches fit. The pinions are coupled by tie rods which extend movably through perforations in collars secured to the hub and these collars thus serve as guides to the transverse movements of the pinions while carrying them around continuously with the hub. A shifting collar is attached to the rods and when pushed in one or another direction by the shifting lever of which the lower attachment is shown in Fig. 4, brings one or the other pinion in engagement with the clutch teeth on the hub and in mesh with the shaft pinion on the same side. The shifter may be held in three different notches at its upper end corresponding to the two gears and an intermediate

position that disengages both hub pinions and permits the rider to coast with his feet on the pedals.

It is worth observing that in this change-gear mechanism the notches in the hub pinions are always in line with the teeth on the hub so that there is no wear on either and a change of gear may be effected while the machine is in slow motion without much danger of breaking gear teeth. It is another question if bevel gear pinions are made so scientifically accurate that side thrust from the shaft pinion upon the teeth of the hub pinions will not push the latter away, incidentally bending the shifting rod; especially during the act of shifting before the two pinions have reached the depth of complete engagement. Stout construction of the parts shown in Fig. 4 would to some extent obviate this possibility, and it might be advisable to remodel the lower end of the shifting rod so as to remove from it any strain that might be caused by the tendency referred to.

#### Rigidity Unnecessary.

The shaft pinions are connected to the driving shafts by means of hexagonal

by two different means. The pinions may be moved forward with their ball races in a manner readily understood from Fig. 1, but when they become worn the contact between the guard flanges makes an adjustment necessary by which the guard flanges are not caused to approach or press hard upon each other. This adjustment is effected by an arrangement for moving the crank shaft and its ball races horizontally forward in the hanger. The guard flanges serve as guides to make the adjustment correct, as they prevent the gear wheels from getting too close to each other, notifying the operator at once through increased friction or irregularity of friction when the desired adjustment has been exceeded.

#### No Provision for Wear of Teeth.

Under the supposition of the inventor that the guard flanges roll without friction and therefore without wear, it seems, however, that they must nullify any adjustment of the gear wheels so far as proper mesh of the teeth is concerned. If this objection is correctly taken, adjustment to take up wear of teeth is precluded; and adjustment to offset misalignment of the frame is also excluded through the necessity of having the guard flanges on both sides revolve in absolutely parallel planes.

The inventor applies his construction also to a bicycle without changeable gear, in this case using a blank bevel roller instead of one of the front shaft pinions to support the lateral strain on the driving gear, and, of course, omitting

sockets which allow the hexagonal ends of the shafts a slight play to compensate for the torsion or yielding of a bicycle frame during riding. Spiral springs are placed in the bottoms of the sockets so as to hold each shaft elastically and make adjustment of the pinion at one end of the shaft independent of the adjustment at the other end.

An adjustment of the shaft casings is provided for the purpose of securing parallelism between crank shaft and rear axle, but it is not seen that much adjustment of this nature can be indulged in without affecting the rolling contact between the guard flanges of the front bevel gears.

#### Adjustment of Gears.

Adjustment of the front shaft pinions in relation to the driving gear is effected

the change gear mechanism on the rear hub. The patent is No. 620,929, dated March 14, 1899.

#### Threatened Suit Over Bevel Gear.

It is reported that the Demorest Manufacturing Company of Williamsport, Pa., is likely to bring suit against the Pope Manufacturing Company for alleged infringement of patents on bevel gearing for bicycles granted to Hugh MacDonald, superintendent of the Demorest works, November 8, 1898. The patent claims cover an improvement consisting of an independent sleeve for the easy adjustment of both front and rear gears of chainless bicycles, to hold them perfectly in mesh, and to make it easy to adjust the gearing if occasion ever requires it. The parts are so geared that three teeth

# WHAT WOULD YOU DO?

The only sensible way to coast is the safe way. The safe way is possible only with perfect control of the bicycle. The minute the feet are off the pedals the control is lost—coasting then becomes a danger.

Eclipse Cycles Fitted with

The Morrow Automatic Coaster and Brake

Make coasting a safe pleasure. It enables riders to hold the

pedals stationary while coasting. A slight back pressure of the pedals applies the brake. The bicycle can be stopped on the steepest hill in the shortest time and smallest space. Any wheel thus equipped can be sold—easily. All the particulars if you want them.

Eclipse Bicycle Co., ELMIRA, N. Y.

# Plain Talks on ANDRAE Cycles

XIV.

Those catalogue comparisons are great things—for Andrea agents.

If you're not selling Andrae cycles what are you going to do when the Andrae agent proves to your possible customers that the Andrae had in 1897 the very features you are trying to sell your '99 bicycle on?

You're going to lose the sale.

Now look at it from the other side. Suppose you're the Andrae agent. You're going to get the sales the other fellow loses.

Look up a '97 Andrae catalogue and compare the '97 Andrae tandem, the '97 Andrae seat post cluster, etc., with those in the other '99 catalogue.

Then think a bit.

Our monthly paper, "The Andrae Agent," free.

BRIDGEPORT, CONN.

of the best hardened steel are in mesh constantly, making it impossible to break a tooth and greatly reducing the wear.

The Pope company had advertised the same independent adjustments for the Columbia bicycle, it is asserted, but did not, however, claim patents on them. Since the announcement of the granting of patents to Mr. MacDonald, the Pope company, has, apparently, ceased to advertise the improvements mentioned.

#### Elastic Bevel Gear Transmission.

In order to avoid disagreeable vibrations arising from the inelastic driving connections in bevel gear bicycles, two inventors of Copenhagen, Denmark, have devised the flexible connection between the crank shaft and the driving gear which is shown in the accompanying illustration, and have received United States patent for it. They mount the bevel gear wheel on a steel sleeve around the crank shaft and form the crank bars so as to enter into a recess of the wheel. It does not fill this recess entirely, however, but is allowed a limited rotary motion in it against the resistance of a U-shaped spring secured at one point on the outer face of the wheel. The crank boss acts as a double lever with a long arm which acts upon one of the free ends of the spring when the crank shaft is rotated, and a short arm which concurrently presses against the other branch of the spring nearer to its fixed point. The resistance of the spring is, of course, always equal to the power required for ro-

tating the gear wheel and driving the bicycle, but there is a maximum of spring tension which is reached when the levers are turned to such a point as to reach the walls of the recess and drive the gear wheel directly. The inventors state that "during even riding the strain upon the spring will be constant, but by riding up and down steep hills it will change and thus offer the elasticity desired." It is obvious, however, that the strain on the spring will vary according to the position of the cranks, being greatest when they are horizontal, so that the spring will be in constant motion during all riding that requires application of any power at all.

#### New Sundries at Riders' Meetings.

A new plan which will be of interest to the manufacturers of cycle accessories has been introduced into some of the branches of the Century Road Club of America, and may be adopted by the members in the vicinity of New York city. With the object of promoting the comfort and convenience of the members, as well as to create a demand for the goods of the various concerns, samples of the new accessories as they appear are shown at the monthly meetings of the organizations. The idea has proved a paying investment for those makers who have availed themselves of the opportunity.

#### Machine for Tapering Rods.

A machine has been patented for the Morse Twist Drill and Machine Company of New Bedford, Mass., by which it becomes possible to give slender steel rods

a perfectly accurate gradual taper. The main improvement consists in a work-support which always backs the work against the turning-tool, preventing the rod from sagging under the pressure of the latter. It may be useful for turning pedal spindles as well, when unusual accuracy is required. The patent is No. 620,955.

#### LOZIERS MAY ENTER FIELD

Naphtha Engine Building Believed to be the First Step Toward Motor Vehicle Production.

Toledo, March 20.—H. A. Lozier & Company's venture into the naphtha engine building field is looked upon by bicycle men here as nothing else than an initiatory step into the motor vehicle business. The Loziers are building a large addition to their plant here, in which will be manufactured the naphtha engines invented by Superintendent Burwell.

Mr. Burwell, when asked what prospects there were of the Loziers engaging in the manufacture of motor vehicles, replied:

"There is no doubt that at some future time the Lozier company will engage in the business, if the popularity of the machine increases. H. A. Lozier, Jr., is now on his way home from Paris and is bringing with him two 'horseless' carriages. In France it is not an uncommon thing to meet \$3,000 machines on the road, and the question of their adoption in this country is only a matter of good roads. As fast as roads are improved just so fast will these vehicles become popular. I cannot say that the Loziers contemplate adding this branch of work to the Toledo factory. The matter is being discussed and as the Lozier people are always first in the field of progress it is natural that consideration should be given to this subject."

#### FREIGHT VEHICLE CONTEST

Liverpool Association Advances Date for Contest from September to July 31.

The honorary secretary of the Self-Propelled Traffic Association of Liverpool, England, E. Shrapnell Smith, has now issued official notification containing conditions of the second contest trials of motor vehicles for heavy traffic to be held under the auspices of the association, as recently mentioned in this paper, and will send printed copies upon application.

It was originally announced that the contest probably would be held in September, but this has been changed. The trials will begin on the morning of Monday, July 31, and will conclude on the evening of Wednesday, August 2. Trial runs will be made from Liverpool over distances from thirty to forty miles. There will be four classes of vehicles eligible, the minimum loads being 2 tons, 3½ tons, 5 tons and 6 tons (2,240 pounds to the ton). The vehicles must be propelled by mechanical power alone, but there will be no restriction on the source of the power or the nature of the agents used. The hope has been officially expressed that vehicles from the United States will take part in the competition.

#### New Handle Bar Co. in Cleveland.

The W. E. Kelly Manufacturing Company of Cleveland, O., has been incorporated with \$25,000 capital stock, by William E. Kelly, Edmund B. Weed, Albert H. Weed, Walter D. Meals, and Ferdinand L. Black, to make bicycle handle bars.

#### Duped by the Larkins.

A correspondent writing from Lincoln, Ill., with regard to Marshall and Patrick

Larkin, 332 Cornelia avenue, Chicago, states that he sold a farm wagon to one Patrick Larkin last June, taking his note, the purchaser giving as his security Allen Larkin, who made a written statement that he owned three flats worth \$30,000, with \$15,000 incumbrance. When the note fell due the Larkins could not be found and the flats had been sold. He thinks this is the same Patrick Larkin whom the Cycle Age warned the trade about last week under "Hint to Credit Men," on page 606.

#### ALMOST A MILE A MINUTE

French Count Breaks All Existing Road Records on His Electric Motor Vehicle.

A Parisian automobilist, Count Chasseloup-Loubat, broke both the standing and flying start kilometer motor vehicle records March 4. The trial was on a road near the outskirts of Paris and was witnessed by a large crowd of automobile enthusiasts and cyclists. Three official timekeepers timed the trial, which comprised a ride of two kilometers, the first being taken as the record for a standing start kilometer, the second for a flying start record for the same distance, and the whole as a standing start trial for two kilometers. The time made was as follows: First kilometer, 48 3-5 seconds; second kilometer 38 4-5 seconds; total for two kilometers, 1:27 2-5. This is much faster than the previous existing record held by Jenatzy, whose time for a flying start kilometer was 44 4-5 seconds, and whose total time for two kilometers was 1:41 3-5.

Count Chasseloup-Loubat's speed for the second kilometer is equal to a 1:01 per mile gait. After this trial several other motocyclists made attempts at the same record, but though some very creditable runs were made none of the other performers came dangerously near the count's time. After the trials were over Jenatzy stated that he would himself make another trial soon and felt confident that he could travel at the rate of 75 miles per hour.

#### Wet Blanket for Light Vehicles.

The French motor manufacturers have proposed to their government to fix the following import duties on foreign made motor vehicles: Vehicles weighing less than 500 pounds, \$45 to \$50; from 500 to 1,000 pounds, \$30 to \$35; 1,000 to 4,000 pounds, \$20 to \$25; more than 4,000 pounds, \$10 to \$12.50. Parts for motors will be taxed similarly according to weight. Apparently the object is to discourage competition of light weight American vehicles, judging from the ratios of fixed duties to weights.

#### American Bicycles Wanted in France.

There have been several demands for American bicycles at the United States consulate at La Rochelle, France. This should be of particular interest to those makers of cycles who have no agents at Paris. Bicycles with chains which could sell for \$40 to \$50 and chainless machines that could be put on sale for \$70 to \$80 would doubtless find a good market here.

#### Trustee for Rouse, Hazard & Co.

At a meeting of the creditors of Rouse, Hazard & Co., held in the federal court room in Peoria last Saturday, Referee McCulloch appointed Col. John McClure trustee, the creditors having been unable to agree upon a suitable person.

Two motor vehicles valued at \$4,513 were shipped to London from New York city recently.

# What you get for your money —

IS AS IMPORTANT AS THE AMOUNT YOU PAY.

Have you ever thought of that? Follow out the theory and what result do you get?

Buy a pair of shoes for \$2.50. They are shoes. You get some wear out of them. (All that you pay for.) Are they comfortable, well turned and sightly? Do you have to get them repaired soon?

Add 40 per cent. to that price and buy another make. What do you get? As good a shoe as is made, don't you? One that will give you good and long service without repair; that is good looking and suits you. You've had value received in both cases, but isn't the latter the cheaper in the end?

MR. DEALER, when you select your leading bicycle for 1899 don't be penny wise. Look to your net results at the end of the season.

# THE PASTIME AND SPORT

## RACING MATTERS IN A MUDDLE

**Press Agents Issue Contradictory Reports  
—Track Owners on the Fence—  
Climax Impending.**

In the battle for supremacy between the L. A. W. and the newly formed National Cycling Association there must soon come a show down when one side or the other will be found to have made some very remarkable misstatements. At present the riders hold the balance of power, and should the one hundred men reported to be under the ban of the racing board succeed in holding a solid front for three months more they are almost certain to win in the struggle for supremacy. But in case of a break in the riders' ranks there will be a landslide to the League. The L. A. W. is devoting its energy to the retention of control over the despised professional racing men. Meanwhile the track owners sit on the fence waiting to jump on the safe side. Few will commit themselves at the present time. The opening of the season, May 30, will probably bring things to a climax and clear the atmosphere. The track owner, with an investment of thousands, must cater to the side on which he can make money, and to draw large gates he must have star attractions, which at present are all arrayed on the side of the L. A. W. opposition.

### Press Agents Waging the War.

Statements made by both sides in the L. A. W.-N. C. A. controversy are most misleading. For instance, it is asserted on the one hand that Charles River Park track will loyally support the L. A. W., while on the other hand the management of Charles River Park denies that it will go contrary to the action of the National Cycle Track Association which voted to join the National Cycling Association. Again, statements are made that McDuffee and Elkes have asked to be reinstated by the League, while counter statements come from an excellent source to the effect that both of these riders and their aggregation of pacemakers will support the N. C. A. in their racing interests.

### Approaching the Racing Men.

Overtures are already being made to the racing men for the early match races of the season. According to the statements of one side, these offers are made on the condition that the men return to the League, and the riders have begun to ask for reinstatement. The opposition denies this, and claims proof, which the original claimants do not show. Thus the situation is complicated in the extreme.

### West to Have Some Racing.

It is the evident intention of the National Cycling Association to start its "grand circuit" in St. Louis, probably July 8, then carry it through Chicago, Racine, Indianapolis, Louisville and Cincinnati to the east. Peoria may be included, according to present plans. Chairman Batchelder of the board of control has been in correspondence with St. Louis people regarding the matter.

### New Racing Board In Action.

The newly appointed racing board held a three days' session in New York city last week. According to press agents

of the League the board received applications for reinstatement from the owners of the Berkeley Oval and Manhattan Beach track in New York, the Pleasure Beach, at Bridgeport, Hampden park at Springfield, and Charles River Park track in Boston, which it restored to good standing last Tuesday, the fines having been paid. It has also been given out that a number of the prominent outlaws have asked to be reinstated and that they have been informed that their request will be granted as soon as the fines imposed upon them have been paid in full. William Martin, now in South Africa, will be reinstated, as his fine has been paid to the ruling cycling organization in the country where he is located at present.

## L. A. W. TO PROMOTE TOURING

**First Step Taken to Popularize Country Riding—  
Will Furnish Routes and Information.**

The new executive committee of the League took a step at its first meeting held in New York city, March 13, which if followed by energetic action will prove a stimulus to League life and will help it to win new members without having to avoid as much as possible the question, "What do I get for my money?" The action is nothing less than the organization of a national touring department to be conducted on lines similar to those followed by the touring club of France.

The first work of the touring committee, of which Paul Aldrich of Boston has been appointed chairman, will be to arrange routes for this country so that wheelmen traveling from one state to another will be able to secure all desired information at the headquarters of the touring committee. It is expected that President Keenan will make a trip to Europe in the near future in the interests of the touring department and with a view to making its scope and usefulness international. The committee will then be in a position to inform tourists going abroad as to railroad and hotel rates and to supply all other information desired by cyclists intending to travel in Europe. The touring department will have a press committee of its own with members in New York, Boston and Philadelphia and perhaps also in other large cities.

### Gimm's Recovery is Slow.

Louis Gimm still lies in bed at St. Luke's hospital in San Francisco. He is sadly emaciated and two enormous abscesses have formed, one on the thigh, the other on the hip. He has lain helpless for weeks and it will be weeks before he will be able to get up. Gimm makes the declaration, "I know who handed me the stuff. I thought it was for the best. In a few minutes I realized what had been done to me, for my legs stiffened above the knees and my power was all gone." Gimm and his trainer, Leonert, know more than they are telling, but which may some day come out, so they say. Leonert is following every clue, but will reveal nothing of what has been learned. Gimm seldom smiles, but when he does smile it is with satisfaction over what he has learned of the true facts in the matter. "I cannot see," said he, "why anyone should want to do me, when I have always been an honest competitor with all and willing to live and let live."

## COAST TRIP A BAD VENTURE

**Heavy Losses of A. C. R. A. Due to Newspaper "Hold-Ups"—Riders Merit Little Sympathy.**

The American Cycle Racing Association lost \$9,000 on the six-day and twenty-four-hour races in San Francisco. The members of the association included Brady, Kennedy and Powers. A. G. Batchelder, now the chairman of the board of control of the N. C. A., resigned his membership previous to the coast trip, believing there was no money to be made in the transcontinental trip. The loss was due to various causes, but mainly to the antagonism of the westerners to anything from the east. It is said to have cost the association \$3,600 in exorbitant rates, "hold-ups," etc., to advertise the six-day race in the San Francisco papers. The purse for the race was nearly \$5,000; the bonuses and expenses of Michael, Elkes, Bald and Fournier amounted to almost \$3,000, the sprint race prizes, while small, amounted to \$1,000, and the track cost more than \$2,300, while rent of the building and labor brought the grand total up to \$22,000. The receipts were but \$13,000.

### Racing Men Were Improvident.

Statements are made by some of the racing men returning from the coast which reflect upon the integrity of the promoters. Many of the men started west without proper contracts with the promoters to furnish them tickets back east. These men spent their money as fast as it was received. The failure of the promoters did not increase their generosity and the actions of the racing men in going into print with derogatory statements entitled them to no consideration from the promoters. Consequently many of them tell a hard luck story which has but little essence of truth. Yet it is true that many of the men were openly abused and the treatment which they received would hardly bear investigation. The promoters had the men in their power. Races were arranged in which many of the sprinters had no chance of winning. None but handicap races were placed on the programme, although scratch races were repeatedly requested. In their settlements the men took what the promoters cared to give them, just as they rode the style of races the promoters felt inclined to run. Starvation purses and starvation rates for pacing prevailed and few if any of the men who left New York returned with aught to show for their trip. The six-day men received all that was coming to them from the purse of \$5,000, divided into eight parts, less their expenses, of course. Still, most of the racing men lost their money on horse racing, and few deserve the slightest sympathy.

### Sedative Administered to Buffalonians.

Buffalo, March 19.—J. Stuart Kelley of this city has been appointed a special representative of the national racing board, L. A. W. Mr. Kelley is a well-known wheelman and is popular with all classes. His new position will vest him with authority to grant sanctions and to have all the other powers of the regular members of the racing board except the power to cast a vote in their meetings. To a certain extent, this appointment may serve to placate the feelings of the local newspaper writers, who have felt

# Get on an Orient and Spin...

## CHAIN OR CHAINLESS.

## THE LONG BEAM BICYCLE LAMP

Has a reflector built on same principle as a locomotive headlight.  
Result—throws light 300 feet.  
Feeds by capillary attraction.  
Result—not affected by jolts and jars.  
The burner will not clog as in other acetylene lamps.

SUMMARY: The first gas lamp to give absolute satisfaction.

JOBBER: Write us before cataloging inferior lamps.

THE LONG BEAM LAMP CO. - HILLSBORO, OHIO, U. S. A.

that President Keenan's slight when dealing out the appointments on the national press committee was altogether intentional. When, contrary to all precedent, the name of Miss Edna Bean of the Chicago Record was included in this committee, sentiment crystallized and some of the cycle writers openly expressed their disgust in the columns of their papers. It is certain that the appointment of no other person as a special representative in any capacity could give more general satisfaction than the selection of Mr. Kelley.

#### Chairman Will Return to Chicago.

Chairman Gerlach, who has been in the east for the past week gathering up the loose ends of his work and sizing up the situation, has about concluded that the complexion of affairs is not so serious as he had been led to suppose, and he will therefore not spend much time either in Philadelphia or New York, but will manage the business of the racing board almost entirely from Chicago. At last week's meeting in the eastern metropolis the plan of campaign was outlined, and as it was evident that each member of the board had an excellent idea of the racing situation in his own section, the chairman concluded to exercise his supervising powers from his home headquarters in the Windy City.

#### To Train at Fountain Ferry.

Louisville, March 20.—Tony Landenwich, manager of Fountain Ferry track, is preparing to care for a colony of racing men this spring. The buildings are being put in order and early next month the riders will begin to gather for training. Bald, McFarland, Stevens, Kimble, Cooper, Kiser and others have been heard from. The report that the Fountain Ferry management would refuse to allow the outlaws to train here is apparently without foundation, as the track is a member of the National Cycle Track Association which allied itself with the National Cycling Association, and Kimble, who is an outlaw, has been allowed to train on the track this winter.

#### Warburton Comes to Train Michael.

James Warburton, son of "Choppie" Warburton, the renowned trainer of old, has arrived in New York city, having come to this country on the cabled request of Jimmy Michael, whose trainer he will be this season. Michael's engagement of Warburton practically settles the question of whether the Midget will continue to race on bicycles or not. Choppie Warburton trained Michael in '94, '95 and '96, and Jimmie accompanied him constantly. It is probable that the younger Warburton learned some of the secrets of his father, and that for this reason Michael sought his services. Michael, it is said, will be under the management of W. Brady this season, and will shortly leave for Louisville to train at Fountain Ferry.

#### Cape Girardeau After Racing Men.

Cape Girardeau, Mo., March 20.—Frank Dunlop, manager of the quarter-mile board track here, is anxious to have the Cape made training headquarters for the racing men this season. He has made unusually low rates for board, rooms and Turkish baths. "Bill" Hyland, former trainer of Fred Loughhead, is in charge of the baths. The track and training quarters are now completed and being located within less than 200 yards of the hotel, are most convenient.

#### Washington-Baltimore Path Plans.

Washington, D. C., March 18.—Local wheelmen are evincing a lively interest in

the project to build a cycle path between Washington and Baltimore. The plan now is to form two associations, one in each city, for the purpose of raising funds to build the path. The Baltimore association has already been formed and has begun an active canvass of the city in behalf of the proposed path. The local association will be formed some time during the present month. When the two organizations are in complete working order it is the intention to form similar associations in the towns through which the path will run. These associations will be incorporated and will issue stock at the par value of \$1 per share. A share of stock makes the owner a member for a year and entitles him to all the privileges of the path for that period.

#### Outdoor Season Opens in France.

The first important outdoor races of the season in France were run at the Marseilles track March 5. A large and appreciative crowd saw the match race between Jacquelin, the popular favorite, and Deschamps. Jacquelin won the first and third heats, the second heat being lost to Deschamps, who made a long sprint during which Jacquelin lost a pedal. After these heats had been run Jacquelin rode and won a race with a tandem team, his opponents being Leynaud and Girardet.

#### NEWS IN BRIEF.

"Abe" Powell, the veteran handicapper for the Philadelphia district, has been reappointed.

The Detroit Wheelmen are much disposed to leave cycle racing entirely alone in the future, the club having already, according to reports, dropped \$10,000 in the game.

Frank G. Peck of Yuba City, Cal., one of the prominent amateur riders of the coast, was burned to death March 10 in a conflagration at the Marysville (Cal.) Woolen Mills.

Angus McLeod, the Canadian rider, has accepted the challenge of John S. Johnson to ride a mile race in three heats paced by triplets. McLeod suggests the posting of \$100 forfeit by each.

The executive committee of the Southern Cyclists' Association has taken action toward the affiliation of the association's interests with those of the N. C. A. and other outlaw racing organizations.

For some time past negotiations have been in progress for the erection of a quarter mile board track at the base ball park in the northern part of the city of Washington, but the deal has now fallen through.

"Old Eagle Eye" Gideon, who for several years refrained from connecting himself with any bicycle club for fear of possible complication, has applied for membership in the Century Wheelmen of Philadelphia.

Racing Board Member Dimon of Philadelphia has already received upwards of thirty applications for sanctions for meets in his territory during the approaching season. Twelve of them are for places on the National Circuit.

It is currently reported that the New York-Pennsylvania interstate circuit recently established, with Binghamton, Reading, Williamsport, Bloomsbury, Wilkesbarre and Allentown as the racing points, is to be backed by the A. R. C. U.

There is lively talk of a match between Orlando Stevens and E. C. Bald, Stevens having issued a sweeping challenge to meet any man in the world for \$1,000 a side in a mile race, and Bald having signified his intention of accepting the challenge.

It comes from across the pond that Lesna, the French rider, has given up cycle racing in order to devote his entire time to the management of a motorcycle business in Berlin. Lesna is well known in this country, having competed in races here on several occasions.

E. A. McDuffee has written to Floyd McFarland, asking for a match race on Decoration day or in June at the Charles River park track, the distance to be fifteen miles and the pace by tandems. McDuffee was delighted with the showing made by McFarland against Elkes, whose defeat of the

Bostonian last fall still rankles in the latter's mind. In addressing the Californian McDuffee gave him the title of "middle distance champion" and his own evident intent is to regain the title.

Canadian custom house officers at Windsor, Ont., are trying to stop the smuggling of bicycles that has been going on for some time past by the citizens of Windsor. It has been the custom to buy bicycles in Detroit, ride them a few days there, and to then take them into Canada as old machines not subject to duty.

John Chapman and Tom Barnaby will soon leave San Francisco for Chicago, riding tandem. They were among those who spent all their earnings on the coast and then made a demand upon the A. C. R. A. for return transportation. They will follow the line of the Santa Fe railroad and hope to reach Chicago in time to take part in the proposed six-day race.

John West, the veteran trainer, is said to be interested in a scheme to build a cycle track in Chicago for the use of the outlaw riders, the promoters being more willing to affiliate with the N. C. A. than with the L. A. W. West also proposes to run a six-day race upon the track, should it be erected. The location chosen is the old west side ball park.

Jack Prince, who has been conducting race meets at Houston, Tex., has moved to Galveston, taking his aggregation of riders with him. The team includes such men as Walthour, Bob Miller and Burt Repine. Prince seems enthusiastic over his quiet little southern circuit and believes that he can encourage the racing interest in that section of the country.

Secretary Lumsden of the Chicago Cycle Board of Trade has intimated to officers of the Associated Cycling Clubs of the city that the board will allow them to canvass among the trade for prizes for the Decoration day road race. This assurance, coupled with a \$500 cash prize donation said to have been given the race committee, makes a good list of prizes for the annual road event seem probable.

The managers of the long-distance race to be run in Paris in May have reduced the duration of the race to 50 hours on account of the many protests expressed after the last three-day race. The prizes for the race range from \$300 down to \$40. An extra prize of \$60 will be awarded the leader at 24 hours and also the rider having the greatest mileage at 48 hours, providing the Roubaix record is broken. The race starts May 30.

Tom Cooper is anxious to begin training and has written to Earl Kiser, asking him to start for Louisville with him at once. Cooper and Kiser will travel together throughout the Grand circuit. Neither has done any training this winter, preferring to rest up for a hard season. Cooper has looked after his business interests, which are considerable now, in telephone and Portland cement stock. Kiser is also interested in a small way in the Detroit telephone stock.

Frederick Michael, the long distance champion of Europe, known in this country as Fredericks, and James W. Nawn, the Irish champion, left San Francisco late last week for France, where both will compete in the long distance grinds of May in and around Paris. Their first start will be in the fifty-hour contest at the Roubaix track, starting May 7, their second in the ninety-six-hour race at Paris, starting May 19, their third in the Paris-Bordeaux road race, and in June and July there are a number of contests in which the pluggers will ride. Both riders will return to America in the fall.

It is practically settled now that Cincinnati will see a middle distance race on Decoration day between Harry Gibson and Floyd McFarland, who have been matched at fifteen miles, both competitors to be paced by motorcycles. Gibson is now in California under the charge of Charles Ward, who will bring his string of racing men, including Gibson, Freeman, Ziegler, Frank Cotter and probably Hardy Downing, east to train at the Chester park track. This track will give racing under N. C. A. auspices every Sunday during the coming season.

President A. C. Newby of the stock company owning Newby Oval, Indianapolis, feels that there is a chance to revive cycle racing in that section of the country, and that under proper management a circuit of several of the western cities could be formed which would not only help the Newby Oval to retrieve past losses, but would yield some profit to the promoters in the other cities of the circuit. Mr. Newby wants nothing to do with the outlaws and is satisfied to stick by the League, even though racing under L. A. W. colors in the future must be maintained by an entirely new set of riders.

## RETAIL MISCELLANY

## General Information Concerning Cycle Agents and Repairmen Throughout the Country

## Alabama.

The Hunt, Hunt Special and Iron City are the three models made by H. L. & E. E. Hunt, 1904-1906 Third avenue, Birmingham. They also carry the largest line of sundries of all kinds to be found in the city. Their repair department is an extensive branch of the business. Mr. Hunt created a sensation last year by actually selling good bicycles as low as \$5 each. The secret is easily explained. These machines had been in the rent department until they had more than paid for themselves.

## California.

Leffert & Hilb have just opened a new bicycle store at 938 Sixth street, San Diego. They carry a full line of Columbia, Hartford and Vedette models, deal in supplies and do repairing of all kinds.

## Connecticut.

L. J. Gladding of New Britain has engaged the basement of R. O. Clarke's hall, where he will start a bicycle repair shop.

Major Taylor, the champion bicyclist, rode ten miles against R. M. Alexander in the windows at Alexander & Elmer's bicycle store at their opening which was held at Hartford. Every lady attending the show on ladies' day received a souvenir hat pin. All of the latest styles of Reading, Orient, Stormer and other standard machines were on exhibition.

## Idaho.

The Capital Cyclery, Boise City, has reopened under the management of Ed. G. Fanning, a capable mechanic, who "doctored" so many of Boise's bicycles last year. The shop will be a branch office of the Rambler company.

E. C. Bickford & Co., 910 Idaho street, Boise City, announce that they have purchased the bicycle shop known as The Cyclery, formerly owned by Bibbins & Brown, and are prepared to do all kinds of repair work.

## Illinois.

Whitson & Craigmile, the proprietors of a general store in La Grange, who carried bicycles as a side line, have dissolved partnership.

H. W. Snyder has rented a room at 205 Court street, Kankakee, and will open a general repair shop where bicycles can be repaired in short order.

The hardware and bicycle business formerly conducted by Helm Bros., at Algonquin has now passed into the hands of John L. Helm.

The death of Jas. D. Sarver, of the firm of Sarver Bros., Le Roy, is reported.

E. D. Scott has gone out of the bicycle and hardware business in Spring Valley. He has been succeeded by Dalzell & Co.

George Kaseburg succeeds Mrs. C. Kaseburg & Sons in the hardware business at Venice. Bicycles are a part of the line handled.

Fortier Bros. will succeed Fortier & Stedman in business at Piper City. They sell bicycles in connection with a general line of merchandise.

M. Bohner & Son have rented the Schechter building in Oregon and will open a first-class bicycle store. Not only will a complete stock of high-grade bicycles be handled, all kinds of repairing done, etc., but the firm will keep machines for rent.

A. A. Cole of London Mills has been succeeded in business by L. F. Tharp. He was agent for Crescent bicycles.

## Indiana.

M. D. Jones of Hammond has purchased A. Wyson's interest in the bicycle business and will move his headquarters to the opera house building. He will do general repair work as formerly and handle a general line of bicycles.

Eller & Irwin of Oxford have gone out of business and F. Menefee succeeds them. Bicycles and hardware are the goods handled.

William Rogers has opened a bicycle and general repair shop at Dana.

## Iowa.

Bobzien & Foster succeed A. D. Craven in the hardware, furniture and bicycle business at Kellogg.

Hy Gilbert & Co. succeed F. C. Foote in the hardware and bicycle business at Goldfield.

I. N. Holmes of Decorah has sold his bicycle business to E. W. Hoyt.

Ira L. Thomas & Co. of Oskaloosa, dealers in bicycles, etc., have dissolved partnership. They were agents for World, Syracuse, Crescent and Crawford models.

## Kansas.

The Carr Bicycle Co. of Wichita is building a tandem pacer to be used at the Wichita meet in August.

Edward A. Ayers has sold out his hardware and bicycle business at Washington.

## Kentucky.

The Danville Dry Goods Co. succeeds Roberts & Farris in the dry goods business at Danville. Bicycles constitute a part of their stock.

## Louisiana.

W. P. Longino & Son of Homer have gone out of business. They carried a line of bicycles.

## Massachusetts.

Clarence Curtis will open a bicycle store under the Adams express office in Lenox.

Chas. B. Woodworth, a bicycle dealer of Newton Highlands, has had his store finely refitted and has taken a stock of various makes. He also attends to repairing.

Horace E. Goodrich of Brighton has started in the bicycle business again, not at the old stand, however. He has removed from his old store to the Brighton cycle store, 354 Washington street, where he also does repairing.

## Michigan.

C. E. Norton will open a bicycle store in Dimondale.

The bicycle dealers and repairmen of Lansing have held a meeting and elected the following officers: F. J. Cole, president; Chas. Rork, secretary, and Smith Clawson, treasurer.

A new bicycle shop has been established in Cadillac by C. D. Shepard & Co. Apparatus of the latest design and most approved pattern for enameling, brazing and vulcanizing—in short, for the perfect performance of all kinds of bicycle work—has been procured. The firm are agents for the White and Columbus machines.

A. Hutton & Son succeed the firm of Hutton Bros. in Oscoda. They handle hardware and bicycles.

A drawing for a \$50 Yale bicycle was held at Tierney Bros.' bicycle store in Saginaw. Over 6,000 persons had visited the store and written their names in a register and received a numbered ticket. A small boy was perched upon the counter and, blindfolded, drew the numbers from a box. The fiftieth number drawn was the winner. Tierney Bros. exhibit the largest line of good bicycles in Saginaw. They have a complete assortment of sundries and a first-class livery and repair shop in connection.

## Minnesota.

I. O. Brown has been purchasing tools and machinery for a bicycle manufacturing establishment to be opened up at Wheaton in the near future.

C. Litzky is reported to have purchased the interest of Mr. Fawkes in the Northwestern Cycle Co. of Pine City.

Knott & Stob of Raymond have dissolved partnership. Bicycles comprised a part of their stock.

The Haynes Trusty Cycle Co. of Minneapolis, which handled the Tiger and Tempest models, has dissolved.

Moore & Newcombe, hardware dealers at Hutchinson, have sold their business to Hunderle, Zila & Co. They will deal in bicycles.

R. S. Swarthout of Pine Island has moved his jewelry store into the Stoffel clothing store, where he will have more room for his increasing bicycle repair business.

The Northwestern Cycle Co. of Minneapolis has leased a new brick block, 121 Sixth street, S., for the handling of its wholesale business. This enlargement was rendered imperative by the company's rapidly increasing jobbing business. The retail business will be conducted as formerly in the old store, corner of Sixth street and First avenue, S.

## Missouri.

Kern & Hollyman will succeed Markell & Hollyman in business at Palmyra. They

handle bicycles in connection with their hardware business.

## Nebraska.

Newman & Cox, of Hampton, have dissolved partnership. Bicycles were included in their line.

## New York.

Lockwood & Adams will open a bicycle store and livery on Park avenue, near Oneida square, Utica. They have received agencies for the Sterling and Hermit bicycles.

L. H. Durland, Son & Co. succeed the firm of Durland, Smith & Co. in Watkins.

Harry J. Moss has opened a bicycle sales-room and repair shop at the Oneida Square Bicycle Academy, Utica. An expert machinist has been engaged and a full line of cycles and sundries will be kept on hand.

George W. Nichols, who was in the sewing machine and bicycle business at Rochester, is dead.

## North Dakota.

The store room occupied by W. G. Carter at Grand Forks has been remodeled. The room has been extended 14 feet farther back and a hardwood floor laid, the walls repaired and new counters put in. The back room will be used as a repair shop and a stock of bicycles will be displayed in the front.

Cavaller is to have a first-class bicycle repair shop. L. B. Wheldon has rented the machine shop formerly occupied by D. J. Egan and will open about April 1.

H. J. Hadley succeeds G. A. Luce in the hardware and bicycle business at Hope.

## Ohio.

George Hamilton expects to return to Montpelier about April 1, when he will open up his bicycle store and repair shop.

Clint Redfern will open a bicycle repair shop in Fostoria on April 1.

A recent fire in Toledo originated in the bicycle factory of Norman Devaux. The fire was caused by the explosion of the gasoline brazer at which Charles Brooker was working at the time. Mr. Brooker was slightly burned about the face and hands, but was not seriously injured. The stock of finished parts and bicycles was almost a total loss, amounting to nearly \$2,500, with no insurance.

Cantwell, Kinsley & Elder is the name of the new firm which will succeed Cantwell & Brinckley in the hardware and bicycle business at Kenton.

J. M. Naylor & Co., hardware dealers, Tiffin, have dissolved partnership. They sold bicycles.

F. W. Dickinson has opened up his bicycle repairing establishment on North Broadway, Geneva, after having made extensive alterations. He has ordered a large supply of all kinds of sundries. He will give prompt attention to bicycle repair work, in which he is an expert.

## Pennsylvania.

William H. Cameron, the well known bicycle repairman, has opened his factory at 225 Elm street, Oil City, for the coming season. A complete line of bicycle sundries and equipments is kept in stock, and any attachment or part of a wheel can be secured on short notice.

A recent fire in Tunkhannock originated among a lot of excelsior and other inflammable material in the bicycle repair shop of T. S. Burson. Mr. Burson's actual loss is not stated, but he had insurance to the amount of \$1,000.

When the local bicycle dealers of Pittsburgh held their annual banquet business was thrown to the winds and everything was talked about except bicycles.

## Rhode Island.

B. J. Foy of Newport has his new store on Thomas street well fitted for his bicycle business. His window display is attracting considerable attention.

## South Dakota.

A. A. Woodward, an enterprising dealer in Clark, has an electric motor which runs a bicycle standing in the window.

## Texas.

C. P. Wilson & Co. of Ennis have sold out their hardware and bicycle business.

## Utah.

J. C. Jensen has received a large stock of bicycles and has reopened his repair shop in the rear of his establishment on First South street, Salt Lake City. Mr. Jensen has made a name for integrity that places him in the front rank of dealers.

## Washington.

R. J. Carnell is starting a bicycle store at South Bend.

## Wisconsin.

A report is current in Port Washington that the water power owned by the Denetts at Grafton will be used the coming summer by a bicycle supply manufacturer.

# INFORMATION FOR BUYERS

## GREAT SUCCESS WITH ELECTRO LAMP.

Acetylene gas lamp dealers have had a great deal of trouble in New York city over the calcium carbide situation. There has been no difficulty whatever with the underwriters, but the commissioner of combustibles took up the matter and compelled those desirous of handling carbide to provide an iron fireproof safe for the same, and limited them to twenty pounds to be carried in stock at any one time. This of course handicaps the carbide lamp business in a way. Greene & Haskell, distributing agents for the Electro lamp, at 1 Union square, hope to conform to the regulations by April 1 by introducing a safe which has practically been accepted by the commissioner of combustibles, enabling one to carry about 100 pounds of carbide.

This firm is now shipping carbide in large quantities from the factory in Niagara Falls, which manufactures and controls the output of carbide for the United States. It is also building a repository in New York city where it will carry in stock two or three carloads in one, two and five-pound cans, as well as a heavy stock of charges for the Electro lamp. This will enable it to make prompt shipments to all parts of the country.

Greene & Haskell state that their business has been unprecedentedly heavy, much in excess of what they anticipated, as they have already taken orders for more than 25,000 lamps. The Electro lamp last year met with great success. The makers discovered, however, in the year's business that there were a few slight defects in manufacturing construction, which in the improved lamp have been entirely remedied. One of the greatest troubles was caused by the carbide contained in cartridges for use in the Electro deteriorating in quality by being carried too long in stock, so that the full four hours of actual work was not gotten out of it. This year, however, it is being put up in an entirely different form, which keeps the charges fresh for an indefinite time. The makers have an additional feature, also, of a handsomely constructed metallic cartridge which can be utilized in the lamp for burning loose carbide, which is favored by some and is slightly less expensive than the other method.

## ADDENDA TO POPE'S SPECIFICATIONS.

Through a misunderstanding of the use to which it was to be put, the information furnished by the Pope Mfg. Co. of Hartford, Conn., which was published in the Cycle Age tables of Current Cycle Manufacture, did not contain the specifications of the two leading Columbia models, 59 and 60, which are the latest improved models of the Pope bevel gear chainless machines. As an addenda to that list, therefore, the specifications of these models are here published, as follows:

Model 59, Men.—Price, \$75; weight, 26 lbs.; height of frame, 22, 24 and 26 in.; tread, 4 1/4 in.; joints flush, crown special, drop 2 3/4 in., rear fork round, rear stay round, lugs on bottom bracket 4, lugs on seat cluster 4, crank shaft one-piece, handle bar fastening internal, seat post fastening internal, cranks round, gear bevel, crank length 7 in., pedals special, rims special, saddle optional, tires Hartford and options, color black.

Model 60, Women.—Price, \$75; weight, 26 lbs.; height of frame, 22, 24 and 26 in.; tread, 4 1/4 in.; joints flush, crown special, drop 2 3/4 in., rear fork round, rear stay round, lugs on bottom bracket 4, lugs on seat cluster 4, crank shaft one-piece, handle bar fastening internal, seat post fastening internal, cranks round, gear bevel, crank length 6 1/2 in., pedals special, rims special, saddle optional, tires Hartford and options, color black.

All the other Columbia models and the Hartfords are built in 22, 24 and 26-inch frame heights, while the two Vedette models are made only in 22 and 24-inch. The chain adjustment throughout the line of chain driven machines is oblique and the chains, pedals and rims are all special. Liberal options are allowed on sprockets, the choice of 7 to 10-tooth rear sprockets in combination with 21 to 25 and 21 to 23 tooth front sprockets, respectively on drop and diamond frames, being offered throughout the line, with the exception of the Columbia Model 49, on which choice of 18 to 20 tooth front sprocket is given, and the Vedette Model 22, supplied with 22 and 24 tooth front sprocket.

## VERNON MODELS TO MEET ALL DEMANDS.

The Vernon Wheel Works, 79 Lake street, Chicago, whose catalogue showing seven models of Vernon bicycles has been recently issued, has endeavored in completing its line to list machines in such variety that the needs and requirements of all sorts of riders both in this country and abroad may be met. To fully carry out this plan each

model in the line is fitted, if desired and at a slight additional charge, with both front and rear mud guards and with front wheel brakes. Wood or steel rims for Dunlop, G. & J., Crescent or Continental tires will also be furnished.

The leading patterns in the line are the men's and women's \$50 Vernons, Models 30 and 31. These machines have flush joints throughout of approved form and are fitted with a two-piece hanger divided at the right end of the axle. The sprocket is of the star pattern. Model 32 is a thirty-inch wheeled men's roadster listing at \$50. In general construction it is similar to the two preceding models. Patterns 40 and 41 are a pair of \$40 machines of substantial, conservative design, and with outside frame joints. Models 42 and 43 sell at \$35 each. These models have outside joints and simple three-piece crank hangers.

## "PUBLIC WIND" MACHINE.

There is no doubt that keeping compressed air on tap in repair shops for free tire inflating is a valuable advertisement. Pumping up tires is work which no one enjoys and riders are bound to show favor to re-

pair shops at which they can inflate their tires without exertion or bother. Robt. Holmes & Bros. of Danville, Ill., offer four patterns of compressed air tanks for repair shop or factory use, each having a capacity of 120 gallons, sufficient for inflating 100 tires at 55 pounds pressure without refilling the reservoir. Each tank is complete with a double acting pump which requires no packing. Choice is afforded between four styles of power, the pumps on the different tanks being equipped respectively with belt driving arrangements, a hydraulic motor, an electric motor and a gasoline engine. The electric motor is wound for 110, 220 or 500 volts. In ordering the outfit with the hydraulic motor the water pressure to be used should be stated. The gasoline engine outfit costs but one cent per hour to operate and is very desirable for shops having no independent source of power. This machine is here illustrated. Each tank is furnished with two ten-foot sections of hose fitted with the company's new automatic inflating valves. The instant the valve is touched to the valve stem of the bicycle tire the inflation commences, and the instant it is dropped the air is shut off. The reservoirs are each five feet in height and two feet in diameter.

## CHAINLESS MODELS SELL WELL IN CHICAGO.

C. H. Larsen, agent for the Sterling bicycles in Chicago, reports a splendid run on these machines, especially on the chainless model. He stated last week that thirty or-

ders had already been booked for the latter model and that in the last ten cases the customers came in and left their orders for the "chainless made by the Sterling company" and did not even ask to have it explained or described. They took it for granted that whatever the company turned out was of sufficient value to warrant their investing their money in it.

Mr. Larsen is also agent for the Tribune and Trinity cycles. The latter was his leading machine last season, so has a certain following which is already making itself known. The Sterling is a new machine at the store, but is so well known locally that it needs no introduction, as is shown by the manner in which orders are being placed. From sales so far made, the chainless bids fair to have a larger run than was anticipated. In the Tribune the agency has a splendid machine, and one in which every confidence can be placed. It has not been pushed as energetically in Chicago as some of its rivals for popular favor, but it will win friends wherever sold.

## PREPARING FOR SEASON OF ACTIVITY.

The Chicago Tube Co., 217 East Washington street, Chicago, is making extensive arrangements to supply the trade throughout the country with a high class line of machines manufactured in an up-to-date plant at the lowest possible prices. The company has for a long time made most of its own stock, but carries everything that enters into the construction of a machine, either of medium or first class, the stock being manufactured by many different concerns, for whom the company acts as agent.

The line of bicycles which the company is particularly desirous of bringing to the attention of the trade is the Pirate AA, in which the best of everything is incorporated. President Waters of the company states that he has spared no expense in producing the machine and feels confident it offers the best value for the money. It has the Fauber hanger and Alpha hubs—the latter the product of the company, and guaranteed to give satisfaction. The chain adjusters permit the rear axle to be removed without disturbing the adjustment of the bearings. As they are secured to the frame and are movable, they are easily slipped over the axle when replaced, thereby making necessary only the tightening of the axle nuts. Expanders are used in both seat-post and handle-bar fastening.

A vital point that has received more than ordinary attention is the fork-stem. This has been heavily reinforced, so that no fear need be entertained from breakage. The company guarantees it for one year.

Besides the machine above described, the company has a line of three models comprising a regulation road machine with Fauber hanger and double rear forks and stays, a 30-incher and a triple crown machine, all three listing about the same as the first Pirate AA. They are the same in construction so far as material is concerned, but are of different designs. To supplement these models the company is producing a cheaper machine to list at \$25 in which the construction is the same, with the exception of the hanger and finish. The hanger used is the Waters two-piece, in which the left crank and axle are in one piece, the right crank being attached by means of a taper and screw.

In addition to the complete machines, the company carries a full line of Crosby & Mayer sheet metal fittings, tubes cut to length, saddles, pedals, tires and, in fact, everything that enters into the construction of a bicycle.

## DAYTONS WIN IN AUSTRALIA.

The Davis Sewing Machine Co. of Dayton, O., maker of Dayton bicycles, has received from its Australian agents a letter which furnishes gratifying proof of the popularity of the Dayton bicycle in the antipodes. The agents' letter is as follows:

"In the early part of the season we informed you that we expected to win for a second time the great Austral wheel race. The man we found and expected to win the race was L. B. Scharp, but by the action of the Melbourne Bicycle Club he was prevented from starting. The club was compelled to pay him the sum of \$1,500 as compensation for their illegal action. This was a great blow to our hopes, as instead of running first as we expected, we only secured fourth place.

"On Christmas day one of our riders, F. E. Fontaine, won the Castlemain Christmas wheel race of \$400, and on New Year's day S. E. Gordon followed this by winning the Castlemain New Year's wheel race, \$400, as well as a handicap prize of \$150, and on the following day also won the Eaglehawk wheel race of \$250. On the same day W. Mathews

won the Creswick wheel race of \$150 and the half-mile event at the same meet.

"On January 21, the League of Victorian Wheelmen held their annual meeting on the Melbourne cricket ground unbanked grass track. The biggest race of the event, the L. V. W. cup of \$500, was won by S. E. Gordon. The 26th of January is the Australian national holiday, and on that day the great Australian National Association fete is held at the Exhibition building, Melbourne. On this one day \$3,500 was given in prize money for cycle racing, \$2,200 of which is for the A. N. A. wheel race of two miles, being the largest prize given in Australia for any cycle race. This was won by W. Mathews on the Dayton in record time. The Federation handicap of \$335 was won by S. E. Gordon, with G. Carpenter second, both on Daytons, and the Australia cup of \$335 was won by G. Carpenter, with G. Bishop second. Out of \$3,500 prize money on that day Dayton riders secured \$2,500.

"We may mention that 280 men entered for the A. N. A. wheel race and more than 200 started. We had only nine Daytons on the track that day and only five men scored their record, being 14 firsts, 5 seconds and 2 thirds.

"These races were witnessed by more than 70,000 people."

**RACYCLE TRAVELING MEN RECALLED.**

Early this month the Miami Cycle & Mfg. Co. of Middletown, O., realizing that the orders already booked for Racycles would tax its manufacturing capacity, recalled most of its traveling force from the road. Although the capacity of the company's plant has been doubled in the last year, the increase in orders this season over those of last is in a much greater proportion. The firm states that the business already done is almost if not quite as heavy as that contracted up to May last year. The only men now on the road are the general representatives for the different sections of the country. These, with their present addresses, are as follows: N. S. Davis, 126 Washington street, Providence, R. I., New England; J. A. Worthington, Willmar, Minn., northwest; L. H. Stephenson, Paola, Kans., west; F. R. Grimes, southern states; J. F. Fowler, Portland, Ore., Pacific coast, and W. E. Houghton, 76 King street, west, Toronto, Ont., Canada. Many of the traveling salesmen who have been taken from the road are now acting as local agents for the Racycle in various smaller cities.

**ROUTE OF THE SOUDAN TRAVELER.**

The Soudan Mfg. Co., 488 Carrol avenue, Chicago, reports that its traveling representative, J. C. Maurer, is now making the states of Indiana and Kentucky. He carries with him three grades of Soudan bicycles. His route for the remainder of this month is as follows: Evansville, Ind., March 23; Henderson and Owensboro, Ky., March 24; Louisville, Ky., March 25; Cincinnati, O., March 28; Indianapolis, Ind., March 31. After finishing his business in these cities Mr. Maurer will visit the following places in Indiana: Anderson, Kokomo, Logansport, Peru, Wabash, Huntington, Fort Wayne, Warsaw, South Bend, Plymouth, La Porte, Elkhart and Goshen.

**READING CHAINLESS GEARS NOW READY.**

The Reading Chainless Gear Co. of Reading, Pa., which was burned out at the commencement of last season and thus unable to get its product on the market last year, is now fully re-established and is ready to ship either complete bicycles fitted with the gear or gear parts in sets ready to be assembled into bicycles by manufacturers. J. E. Blackman, general manager of the company, is now in Chicago for the purpose of establishing a western agency.

**BELLS AND CYCLOMETERS SOLD TOGETHER.**

It has been deemed necessary by the Bristol Bell Co. of Bristol, Conn., to keep on the road another traveling salesman in addition to C. W. Mallery, who is well known to the trade as a successful and enthusiastic business hunter for Peerless and Corbin bells. It has accordingly secured the services of M. J. Horton, who will look after the eastern territory. Mr. Mallery in the future confining his efforts to the west. The company has also made arrangements whereby its travelers will also represent the Veeder Mfg. Co. of Hartford, Conn. The two lines, bells and cyclometers, rank very nearly in the same class, and a selling combination on the two ought to prove very satisfactory to the trade.

**B. & L. DETACHABLE TIRE.**

The Berger & Larsen Tire Co., 152 Lake street, Chicago, is introducing the B. & L. Detachable tire, the general construction of which may be seen in the accompanying illustration. The tire is a new departure in the way of detachable double tubes, it not being held to the rim by grooves, beaded edges or wires, and not requiring a special rim for its attachment. J. A. Berger, secretary and manager of the company, is the

inventor of the tire, and to him a broad patent was issued in the fall of 1898. In each edge of the tire jacket or casing are eyelets securely fastened to the tire fabric and rubber. These eyelets are so placed that they may be hooked over the extension button ends of special spoke nipples. While the eyelets are large enough to slip easily over the nipple ends and thus accommodate themselves to slight variances in the drilling of the rim, the tire when inflated has

no tendency to loosen from its fastening, because the pressure of the air causes the tire jacket to pull one way on the buttons from one side and in an opposite direction from the other, and also because considerable downward pressure toward the rim is exerted by the inflated tire.

To that edge of the casing which is undermost or next the rim when the tire is in place on the wheel, a wide flap is secured which not only covers the other edge and prevents pinching of the inner tube in assembling the tire, but protects the tube from chafing on the heads of the extended nipples. If the user of the tire can locate the puncture without entirely removing the inner tube, it is a very easy matter to open the casing for a short distance in the locality of the puncture and thus expose that part of the tube. To remove the tube entirely the upper edge of the casing is unhooked all around the rim, but the other side is not disturbed.

In order that the tires may be sold to dealers and repairers to use on old machines the company furnishes free with each pair of tires a sufficient number of the special nipples to fit out the rims of the wheels to which the tires are to be attached. The tires are now ready for delivery in standard sizes and will be furnished to match the number of spokes in wheels as specified by the buyer.

**CARBIDE DELIVERED DAILY TO DEALERS.**

The Cycle Syndicate, 320 Broadway, New York city, has opened a distributing depot for the sale of calcium carbide, packed in one, two and five-pound cans, prepared for all forms of acetylene gas lamps. It has established a system by which orders received one day will be filled the next day by wagons. This will no doubt be of great convenience to the hundreds of dealers in the vicinity of New York who sell acetylene gas lamps. Carbide is sold for cash only and is not delivered on rainy days.

**RIESS COUPLERS FIND GROWING FAVOR.**

The Riess bicycle coupler, advertised in this issue by the Riess Bicycle Co. of Zanesville, O., is reported to be having an extensive sale both in this country and abroad. The increased business which the company is

enjoying attests the growing popularity of the device with riders socially inclined. This coupler adds only five pounds to the weight of each bicycle. It is neat and graceful in appearance and can be attached to any style of bicycle.

**FAST EXPRESS SHIPMENT TO MEXICO.**

The Mexican Daily Herald of the City of Mexico, in its issue of March 3, gave an account of an unusually fast express shipment from the United States to that city. The shipment in question comprised a consignment of Stearns bicycles from the fac-

tory of E. C. Stearns & Co. of Syracuse, N. Y., to that company's Mexican agent, Mr. Hilario Meenen of Mexico City. The entire time consumed between Syracuse and Mexico was five and one-half days. The shipment was held for 24 hours in the custom house at New Laredo, thus making the actual time of the bicycles on the road less than five days. The superintendent of the Mexican National Express Co., which had charge of the goods after they left the care of the American Express Co., states that while the shipment broke all previous records, no especial effort had been made to bring the goods through in record time.

**HOFFMAN BRANCH FOR ROCHESTER.**

Owing to the large increase of its eastern business, the Hoffman Bicycle Co. of Cleveland, O., has purchased the good will and fixtures of its former agent, J. J. Mandery of Rochester, N. Y., who is retiring from the bicycle business, and will open a fine bicycle store at 69 and 71 East Main street, Rochester, where a full line of Hoffman bicycles will be carried at all times. New York state and vicinity will be supplied with goods from Rochester on regular stock orders. C. B. Achilles, who was formerly assistant to Mr. Mandery, will be manager of the store. A full line of accessories will be carried. This will be one of the handsomest stores in Rochester, the display room being 35x70 feet, with a fine front, and additional rooms attached for storage.

**HELPING CLEVELAND AGENTS TO THE FRONT.**

H. A. Lozler & Co. of Cleveland are supplying their agents throughout the country with handsomely enameled signs bearing the words, "Cleveland Bicycle Agency," and showing a picture of the Cleveland name plate to the left. These signs are finished with a royal blue background and white lettering, the latter relieved by a dainty scroll entwined among the letters. Some of these signs are made with a support adapted to be secured to the wall of a building or to a post where it will stand out prominently over the sidewalk and be seen by passers-by, while others are provided which may be nailed to a post or flat against the wall. The company is also sending its agents each a cloth banner large enough to cover the front or back wall of a 25-foot building announcing that Cleveland cycles are for sale within.

**TWO VALUABLE REPAIRER'S TOOLS.**

Bicycle repairers and small builders having much tube cutting to do have often wished for something more convenient than the hack saw of our fathers, and realizing this want, Ayes & Co., 58 Ellen street, Chicago, have placed in the market a tube cutter which sells at a nominal price, occupies but little room on a bench or table, and which is furnished to operate either by hand or belt power. The hand cutter is operated by a crank, the motion being transmitted to the cutter arbor through sprockets and chain. Another repair shop tool of easily recognized convenience manufactured by this firm is the sprocket wrench intended to aid in the removal of rear sprockets. The wrench takes 7, 8, 9 and 10-tooth sprockets, and by its use any sprocket, no matter how tight, may be removed from the rear hub without danger to the teeth. It should also be found very convenient in the assembling rooms of factories.

**THE MURRAY ACETYLENE GAS LAMP.**

William P. Murray, 533 Broadway, New York city, is the sole importer of the Murray gas lamp, which is a very uniquely shaped little acetylene lantern weighing but eleven ounces. The lamp sells at a reasonable retail price, with a good profit to the dealer. It can be readily taken apart for cleaning and other purposes and has the distinctive advantage that it can be lighted the instant the valve is opened. The reflector is of the parabolic type and is made of aluminum. The lamp has numerous other features which recommend it to those looking for a thoroughly reliable and substantial acetylene gas lamp which can be sold at a moderate figure.

**UNION WHITEHEAD CATALOGUE.**

The Union Cycle Mfg. Co. of Highlandville, Mass., recognizes the fact that the bicycle industry has advanced to a stage where the readers of catalogues are not interested in long descriptions of manufacturing methods and claims of the kind which can be applied as well to the product of one factory as to that of another. It has accordingly limited the reading matter in its recently issued catalogue to cover such points as are distinctive to Union manufacture. The catalogue shows the five models made by the company. The Union Whitehead, in men's and women's patterns, has the same lines and general construction which have given it a wide reputation. It lists at \$65. The Union Redhead is a new member of the line and in two models at \$50 each is offered as a strictly first class machine for agents to sell as a

lower priced supplement to the Whitehead line. The machine has flush joints and is fitted with Fauber pattern one-piece cranks and shaft, the hanger being manufactured in the Union factory after special designs of the company. The Whitehead is also made in a chainless pattern. It has the Sager gear and lists at \$75.

#### ARNSTEIN'S DIP ENAMELING PROCESS.

Eugene Arnstein, 86 West Lake street, Chicago, has been experimenting for some time with view to perfecting a process whereby colored enameling might be done by dipping and the cost of brushing on the several coats thus saved. The result is, he states, that by his method enameling in colors can be done as successfully as can that in black, to which finish dipping operations have been generally limited in the past. Mr. Arnstein invites correspondence from manufacturers and enamellers and is willing to give such the benefit of his experimental work and to put them on the right road toward the successful accomplishment of dipping frames in colored enamels by his method.

#### "3-KROWN" HUDSON CATALOGUE.

The trade mark of the Bean-Chamberlain Mfg. Co. of Hudson, Mich., is strikingly original and is quite fitting as an advertisement for the "3-Krown Bicycle Builders." It comprises a crown, the lower ring of which is of the regulation historical type used by kings and queens for centuries, but the upper open work portion is distinctive because composed of three arch fork crowns overlapping each other. The trade mark is simple but bold in effect and is used as the cover decoration on the recently published catalogue of the company. The catalogue shows the eleven models of Hudson, Lenawee and Nox-all bicycles manufactured by the firm. The specifications are brief and carefully compiled, and the illustrative work and typographical composition of the brochure are tastily and cleanly executed. One of the features of the line of models is the 0-inch pattern Lenawee, which is offered to dealers as a strictly reliable large-wheeled bicycle at a popular price.

#### ILION RECOGNIZES THE REMINGTON.

The Board of Trade of the city of Iliion, N. Y., held its third annual banquet March 14. Covers were laid for 150. The menu card is a good indication of the closeness with which the name Remington is identified with all matters pertaining to the city of Iliion. On the front cover directly under the title is a half-tone showing a Remington bicycle and a Remington shotgun, with the word Remington in red across the picture. The Remington Arms Co. not only has gratifying business relations in its home city but is at this time very secure in its relations throughout the country. So successful has been the skirmish for new agents and the canvass among old ones that all of the company's traveling force has been called in that orders already placed for Remington bicycles may receive prompt attention.

#### ECLIPSE CYCLES SELLING READILY.

The Eclipse Bicycle Co. of Elmira, N. Y., reports that its traveling men are constantly making new agencies and attributes this largely to the fact that its machines are fitted with the Morrow coaster and brake. The company does not find it at all difficult to place agencies for Eclipse bicycles in territory where it has never sent traveling representatives before, and feels that the coming selling season will be a very good one for the bicycle trade in general. In addition to having started a satisfactory bicycle trade for the season, the firm is enjoying a large business with the Morrow coaster and brake attachment, which it is supplying to twenty American manufacturers and to a number of English and German makers.

#### CLAIMS THAT HAVE FOUNDATION.

Though combined claims for durability, beauty and general excellence are as old as commerce in any kind of manufactured product, the Hollenbeck Saddle Co. of Syracuse, N. Y., is not making an empty boast when it says that its 12-ounce rawhide saddle possesses these qualities. The favor with which the saddle has been received by manufacturers, dealers and riders is evidence of the fact that though young in its commercial career, the rawhide baseless seat will play an important part in the equipment of bicycles the present season and in the future.

#### RACING HUBS OF PLAIN CONSTRUCTION.

There are very few firms which are satisfied to rest the merits of their product entirely on design and workmanship while refraining from incorporating any feature for which special virtues are claimed. Such, however, is the position of Walker & Ehrman Mfg. Co., Washington and Union streets, Chicago, in regard to their new rac-

ing hubs shown in the accompanying illustrations. The pair of them weighs less than one pound and every feature which is superfluous for racing purposes, such as felt washers or ball retainers, is left out. The sole object which has been aimed at has been to produce a hub which will run with the smallest friction when well cleaned and oiled for a racing event, and in which the extreme simplicity of design forestalls any possibility of getting out of order. Micro-metrical accuracy in the bearing parts is

secured through careful lathe work, scientific tempering, subsequent grinding and polishing, and through the employment of fine-grained tool steel. Rigidity is obtained by the proper distribution of metal and by using Stubb's steel in the axles. The cones are made with a dust flange which enters with a steam engine fit into the cups and the flange is grooved on the circumference to hold a film of viscous oil, making the hub sufficiently dust proof to serve all practical purposes even for road races and other prolonged events. In fact, it is as dust proof as most hubs with felt washers without sacrificing any free spinning qualities to this feature. J. E. Smith represents the manufacturers on the road.

#### WEBSTER-WHITCOMB BENCH LATHES.

The American Watch Tool Co. of Waltham, Mass., which manufactures the Standard adjustable pedal, has also in the market a line of fine watch tool and small precision machinery. One of the most popular machines in this line is the Webster-Whitcomb watch-makers' lathe. This tool has an 11-inch bed, 3.94-inch swing, and is intended to accomplish the most accurate light turning of the character of the work done by watch repairers and other fine workers in metal. The design of the lathe and the finish of the parts mark it as one of the highest types of small machine tools made.

#### BANNER AUTOMATIC FOOT PUMP.

The accompanying illustration shows the general appearance of the Banner Automatic foot pump manufactured by D. B. Smith & Co. of Utica, N. Y. The main claim for the pump is its convenience, it being at-

tached to the tire valve by merely setting the end of the air discharge spout down upon the valve. The spout is provided with a conical rubber bushing and will fit all styles of valves. It is not necessary to stoop down to connect the pump to the valve, as there are no swivels or flexible

hose used with the pump. The pump barrel is formed with an interior conical base which expands the leather cup on the plunger at each full stroke and thus keeps the leather from shrinking and sliding uselessly in the barrel. This feature also allows the pump to be stored away for almost any length of time with the assurance that it will be ready for use and will pump air on the first stroke after being put into operation again. The metal spout is one solid fixture with the foot stirrup and no danger of breakage under ordinary circumstances exists. The barrel is made of 1/4-inch brass tubing, nickel plated. The handle is enamelled and the base has an aluminum finish.

#### ACTIVITY IN SUNDRIES TRADE.

J. H. Collins, secretary of the Buescher Mfg. Co. of Elkhart, Ind., and also principal traveling representative for the cycle sundries manufactured by the firm, has just completed a trip through the east, visiting the jobbing trade in the larger towns. He reports that with but few exceptions the sundry trade is nicely started for the season in the various cities and that nearly everyone feels a great amount of confidence in the business to be done this year. Mr. Collins was in Chicago the first part of this week, from where he has gone to Cincinnati. He will visit Indianapolis the first of next week.

#### ACTIVITY IN TAP MAKING DEPARTMENT.

Chas. H. Besley & Co., 10 North Canal street, Chicago, report that they are very busy in the tap and die department of their factory at Beloit, Wis. They are making many shipments of their new Badger non-adjustable die stock which cuts the same size thread each time and forms a full thread at one cut. These are made in complete sets of bicycle thread sizes and also in machine screw and regular bolt sizes. Recent shipments of taps and dies in large lots have been made to Rockford, Milwaukee, Rock Island, Pullman, South Chicago, Joliet, Omaha, London, Lima, Rio de Janeiro and other manufacturing points.

#### STANDARD ARTICLE FOR MANY YEARS.

If there is any article in the bicycle sundry trade which may truly be said to be "old and reliable," that article is the "Perfect" pocket oiler manufactured by Cushman & Denison, 159 Ninth avenue, New York city. The oiler has sold for many years in cycle stores all over the country and dealers unhesitatingly recommend it as an oiler which can be depended upon not to leak and to regulate the supply of oil to a drop. The company has recently issued a small folder containing a number of voluntary testimonials from people who stake their word upon the merits of the "Perfect" oiler.

#### EDMONDS & METZEL IN NEW QUARTERS.

Edmonds & Metzels, makers of the Perpetual pedal, are now settled in their new manufacturing quarters at 253 South Canal street, Chicago, and owing to the greatly increased working facilities are in a position to fill all orders for their pedals on short notice and at prices which are sure to interest all who are looking for high grade pedals at figures which are not extravagant. The firm reports that the simplicity, lightness and strength of the Perpetual pedal has gained it many friends during the short time it has been in the market.

#### WAVERLEYS IN THE FRIENDLY ISLANDS.

The Indiana Bicycle Co. of Indianapolis, Ind., has received word from Nukualofa, Tongalaber, Friendly Islands, that a Waverley rider, F. R. Parker by name, won the Tonga championship races there on January 4. The races were contested on a rough grass track and were not fast, but the winner says that he had no trouble in reaching the tape first. The machine ridden has been in use two years, and according to the owner's statement has withstood the tropical climate finely, the wood rims showing no tendency to warp. The coral sand on the roads cuts the tires badly, however.

#### MISTAKE IN FIRM IDENTITY.

In a recently published report in another paper it was stated as an item of news that A. Barber of the Toledo Cycle Supply Co. of Toledo had entered a petition in bankruptcy. Mr. Barber is no longer connected with the company named and has not been for the past two years. His relations with the company ceased when the old company failed in 1897 and the present firm took up the business.

#### OLD TRADE MEMBER AT THE HELM.

The Wellington Cycle Co., Atlas block, Chicago, is practically a new concern in the trade, but is managed by an old member, Charles L. Thayer, who was for a long time connected with the Hamilton Cycle Co. of Hamilton, O., and later with the Hamilton-Kenwood Co. of Grand Rapids. The pres-

THE DAVIS SEWING MACHINE CO.  
Dayton, Ohio.

ent company is now conducting a mail order business exclusively, selling direct to dealers but not to riders. The manager says he can give the dealer better goods for less money than can be obtained by the agent from the larger makers who employ a large staff of traveling salesmen and do extensive advertising. He makes his own goods. Mr. Thayer states that he expects to place at least 3,500 machines the coming season. Trade is beginning very well.

**WHALEY PEDAL STIRRUP PATENTED.**

Charles F. Whaley, of the well known supply firm of St. Paul, Minn., has obtained patent for a "bicycle pedal stirrup," as shown in the accompanying illustration. The claim of the patent is "the combination with a bicycle pedal of a toe support adapt-

ed to be attached thereto consisting of a plate having a cross-piece at its rear end, the ends of said cross-piece being bent outwardly and at right angles thereto, and a substantially T-shaped non-metallic flexible portion secured to said toe plate and bent ends, and extending thereover, substantially as described." The application for the patent was filed in November, 1895.

**LARGE FOREIGN BUSINESS IN IDEALS.**

The Shelby Cycle Mfg. Co. of Shelby, O., was never busier than at present. The activity is not alone due to the prosperous trade in this country enjoyed by the company, but is partly because of the heavy shipments being made to countries in all parts of the world. An idea of the amount of foreign trade handled by this concern can be grasped when it is stated that the shipments are not measured by crates, but by carloads. During one week recently four carloads were sent to Paris, one to Abo, Finland, one to Stockholm, three to Copenhagen, one to London, two to Winnipeg, two to Toronto, two to Buenos Ayres and one to Hamburg. Each carload comprises from 250 to 300 Ideal bicycles.

**PREPARING FOR HEAVY LATER DELIVERIES.**

The Calumet Cycle Co., Michigan and La Salle streets, Chicago, is storing up a stock of machines that will be sufficiently large to fill promptly at the times designated all orders calling for future deliveries. The company has already shipped 1,800 sample order machines this season and expects to send out 3,000 bicycles within the next month. It is expected that the export business will be considerable, as the company has shipped a number of samples abroad during the last two months. Forty per cent. of the output of the factory is in thirty-inch wheel machines, for which the company finds there is a large demand. No tandems are made by the Calumet people.

**TWO IMPORTANT POINTS.**

There are always two things about a low priced tire liable to make trouble; one is the fact that the inner lining is often imperfectly vulcanized, so that when punctured the repair plugs will not stick, and the other is that the outside rubber shoe is often badly frictioned, so that it is liable to peel from the fabric. The New Brunswick Rubber Co. of New Brunswick, N. J., pays particular attention to these two points, and even its lowest priced tires are free from these troubles. The Regal, which has been on the market for two years and sells at a very reasonable price, is said to have been absolutely free from either of these defects. The rubber never peels from the fabric, and if punctured, the repair plugs always stick perfectly.

**REPAIRMAN WANTED IN BRITISH GUIANA.**

A cycle dealer in Demerara, British Guiana, writes as follows: "We are looking for a cycle repairman who can do lathe work, such as turning up cones and small screw parts, screw cutting, and who has a general knowledge of fitting and brazing, at a contract of about three years at \$50 a month. The climate compares favorably with that of the United States and such a man can live comfortably on \$30 a month." Address care of Cycle Age.

**FIRE CAUSED LITTLE DELAY.**

On the morning of March 10 the boiler house and coal sheds of the H. A. Matthews Mfg. Co. of Seymour, Conn., were consumed by fire. The company has now started its boiler and made the necessary repairs to the furnaces and the fire will cause no further interruption to the business. The company is prepared to fill all orders promptly as heretofore.

**ENTIRE STOCK OF IDES PURCHASED.**

The Speed Mfg. Co., 71 West Jackson street, Chicago, has purchased the entire stock of completed Ide bicycles remaining unsold after the failure of the Ide company. The lot includes men's and women's roadsters, tandems and racing machines, all of which will be closed out by the Speed Mfg. Co. at extremely low prices as soon as possible.

**BECOMES PLEW SADDLE CO.**

The Plew & Motter Mfg. Co. of Chicago has certified to a change of name to the Plew Saddle Co., to change of object of incorporation to manufacture bicycles, to an increase in directory from four to five members, and to an increase in capital stock from \$5,000 to \$25,000.

**CARLOAD SHIPMENT OF HUDSONS.**

The Bean-Chamberlain Mfg. Co. of Hudson, Mich., recently shipped a full freight carload of Hudson, Lenawee and Noxall bicycles to the Bean Sons' Co. of San Jose, Cal., which is coast agent for the Bean-Chamberlain Co.

**HANNA CATALOGUE COMPLIMENTED.**

The Hanna Cycle Material Co. of Buffalo, N. Y., has received numerous letters from its patrons complimenting the completeness and neat typographical appearance of the company's recently issued catalogue of cycle fittings, sundries and supplies.

**OTT & HEMLEY DISSOLVE.**

Toledo, March 20.—The firm of Ott & Hemley, manufacturers of the Lucas bicycle, has dissolved partnership, D. A. Hemley retaining the business.

## GOOD OUTLOOK IN THE WEST

**Prices Find a Resting Place and Sales Will Be Lively—Weather the Only Deterent.**

Salt Lake City, March 27.—The intermountain country of the west, as in most other sections of the country, gives promise of experiencing a healthy, lively cycle trade this season, and the dealers are full of confidence that it will be a prosperous year. For years past—in fact almost since the beginning of the cycle trade—the public have bought grudgingly and were not sparing in their opinions that they were being “held up.” Not knowing the peculiar conditions of the cycle trade and the enormous incidental and large overhead expenses connected with the production and marketing of bicycles, riders could not understand the difference between the list price of the bicycle and the market price of other manufactured articles produced by skilled labor and modern machinery at a much lower cost. No amount of explanation on the part of the dealer could satisfy the buyer that he was not paying someone an enormous margin of profit, and even many dealers shared the opinion of the public.

### Inconsistency of the Public.

The reduction of the list of pneumatic-tired safety bicycles from \$150 to \$125 and later to \$100 did not satisfy them, and they still felt that the retail price was out of all proportion to the cost of production. In a measure this was true, for the enormous expenses incurred by many manufacturers for racing teams and injudicious advertising, and the large stock losses incurred through the complicated unlimited option system were all illegitimate expenditures which were made good at the public expense.

The makers were nearly all in the same game, however, and none felt strong enough to dispense with these methods of marketing their goods and reducing their lists, for the buying public, with strange inconsistency, immediately looked with suspicion on a bicycle which listed at less than the “standard” price.

Even the reduction of the acknowledged high grade bicycles in 1898 to \$75 did not wholly satisfy the average buyer and the clamor for “cheaper wheels” was louder than before, with the result that many of the big guns found a large number of their old patrons going to manufacturers of lower priced machines.

### Nobody Expects Further Reduction.

At the present time, however, the \$50 models of the large makers of standard high grade wheels are in great demand and for the first time the public seems satisfied. Rarely, if ever, is the complaint made that the \$50 price is not a fair one. The public have become educated to a great extent in the cost of production of

a first-class bicycle and feel that a \$50 list price gives manufacturer and dealer only a fair margin of profit. Sales are therefore wonderfully stimulated. Riders who bought \$25 and \$35 bicycles a year or two ago are now freely buying the best product of the reputable concerns. Dealers have found to their sorrow that there is little profit in selling at less than \$50 list and some of the larger agents who in 1898 sold from 200 to 400 medium priced machines have discovered when they balanced up their books at the end of the year that they had made practically no profit for their season's work. Dealers and riders alike are satisfied with the present price and no one is looking for further reductions.

### Best Quality Finds Ready Market.

During the years that bicycles have been coming down in price they have been improving steadily in quality and construction, and this is another cause for stimulation of sales. One manufacturer who has made a specialty of new features and improvements is finding a ready market for his best product among discriminating riders at a list price of \$75 for a light chain driven machine.

Reports of sales in this section indicate that interest in the chainless models has not been so much aroused as in the east. The public seems to still entertain doubt as to the easy running qualities of the chainless bicycles and to object to the increase of weight over the standard chain machines. Riders appear to be waiting for a reduction of the weight and perhaps of the price also. Dealers are therefore ordering samples only at the present time.

### Suffering from Bad Weather.

The entire west has been experiencing an unusual amount of bad spring weather, and Colorado, Utah, Idaho and Montana are in many places still deep under the snow. The restless interest evinced by riders in the coming season's riding and their frequent visits to the stores, however, indicate that with the first days of good riding weather there will be an unprecedented scramble for good bicycles.

## SPALDING HAS MANY OPTIONS

**Sellers May Be Asked to Take Stock in Part Payment—Accountants Ready for Work.**

There are no new facts of striking importance to record in connection with the project to consolidate the bicycle factories. Mr. Spalding still continues to get options, extending till June 1, on the purchase of concerns, and as fast as they are received a clerical force, operating under the direction of the syndicate of financiers, gives each establishment a number and is from that moment blind to its business individuality at least as far as title is concerned.

It is understood that a large firm of accountants is holding itself in readiness to make a minute examination of the books and factories. Two hundred or more skilled appraisers will simultaneously go to work in various parts of the country, charting factory floors, making drawings of every tool and machine, ascertaining their cost from invoice, appraising stock, and in that way arriving at a valuation of the gross worth of each plant. Special observation will be paid to factory capacity and economic methods of production and in each instance these matters will be made the subject of elaborate report.

### Sellers Urged to Take Stock.

It is hinted that, although the avowed intention of the capitalists is to purchase for cash, some sellers may be urged to take part of the sale price in stock in the new company, and this course of action is defended upon the ground that the public would invest more freely in the listed shares of a big company if it were known that the former owners of the consolidated plants had faith enough in the bicycle business to continue to risk some of their own money. But it is not disclosed what form of stock, whether common or preferred, is likely to be so offered to the sellers.

Further contributed opinions on the subject of the consolidation are herewith presented:

### Conditions Demand Radical Measures.

Anything in the way of a combination, or consolidation, of bicycle makers would be of advantage to the trade. Present conditions surely call for some radical measures to secure an improvement. We have not as yet been approached by any parties with a mapped-out programme that would likely produce the desired result. Evidently if the larger manufacturers would take hold of some such project in earnest, it would be easy of accomplishment. The benefits to the trade at large would certainly be very great, not only to the makers, but to dealers.

AMERICAN B. H. O. & SEWING MACHINE Co.  
Philadelphia.

### Distribution of Goods.

A combination of manufacturers would reduce the cost of manufacture and selling expenses to such an extent that it would afford a handsome profit to all. They could have one large retail store in each city and

control the small agencies from each city, and in this way get a much better price; or they could sell direct to the consumers on the installment plan through agencies established from their own stores, something like the sewing machine trade, and in this way control the trade. The business done in this way would soon reduce the number of agents, which would reduce competition, both as among manufacturers and retailers. The retail trade would welcome anything that would prevent unjust competition, or that would give them fair profits in return for their labor.

The most serious drawback to anything of this kind is the presence of the parts manufacturers, but we think the present prices are already commencing to cut down a portion of their trade, as a number of the small makers are already dropping out of the business. In a combination of this kind each one would likely make only one wheel, and in this way could make it so much cheaper, and the small manufacturers would soon be out of it.

Buffalo. KENSINGTON BICYCLE MFG. CO.

#### The Industry is Chaotic.

If the combination is effected it will act as the safety valve to the bicycle industry. With capitalists getting it into their heads that there is a fortune in the manufacture of bicycles, and because of the disappointment of many of these men, the bicycle industry has been thrown into a state of chaos, the result of which we are reaping today, the buyer making the price of the wheel, practically. Organization work will have telling effect, giving to the public a better wheel, steadier employment to the working man, and placing the agent on a level with any legitimate mercantile house. It should have a good effect upon every department along the line.

Poustown, Pa. LIGHT CYCLE CO.

#### In Favor of the Combination.

We would be heartily in favor of a combination, as we are quite certain that a strong one would be of great benefit in maintaining reasonable prices for standard wheels, discouraging the manufacture of trashy department store bicycles, establishing a sounder credit basis, and hence a more satisfactory way of distributing products. Further, a strong combination would infuse new life into the cycle trade and place it upon a sound footing equal with other lines.

Elgin, Ill. ELGIN CYCLE CO.

#### Opinion of Grip Makers.

The proposed combination of bicycle interests seems to us a very good scheme, provided that it is expected that the public will take hold of the project and bear the expense of closing out some of the weaker but trade-disturbing manufacturers. In view of the fact that the prices on all parts are as near the ground today as they can be put under the circumstances, and every large manufacturer in good standing gets the benefit of these low prices, it would hardly seem that the proposed combination would be of much advantage in purchasing parts and supplies. So long as the parts manufacturers are left out of consideration, and there are small machine shops, just so long will it be impossible to corral the small trade.

Malden, Mass. BASCARMAN MFG. CO.

#### Will Not Join the Combination.

We are and always have been opposed to any and all kinds of trusts, and, if we had a factory larger than a flock of barns, we could not think of entering into this deal. We feel that we shall always be able to get our share of the business and, in fact, unless some of the bicycle concerns come down on their prices next year, we are going to trot them a merry clip.

Filint, Mich. AMERICAN MACHINE CO.

#### Have Not Received an Entry Blank.

We have not been as yet approached in any way. We note, however, that two other concerns in this city have received "entry blanks," although their output per annum is smaller than that of our factory. Our output for several seasons has been running from six to eight thousand machines, for which everything has been manufactured under our roof, including all of the hubs and all of the pedals up to this season. Having heard so little about the combination, we cannot say whether the trust would help or antagonize our interests. If it would attempt to secure control of tubing and forging plants, it might place us in a bad way.

Cleveland, O. OTTO KONIGSLOW.

#### Worrying the Dealer.

We have been asked for an option on our plant, but have not yet made a figure. We think the scheme a good one in many ways. For instance, down in New York state there is a hamlet that has one dealer. He sells about twenty wheels a year. This year no less than forty-eight traveling men have called on that dealer in an endeavor to sell him goods. At the very lowest estimate

these trips cost the firms \$5 each. Now there's \$240 spent in selling twenty bicycles, and everybody knows enough of the bicycle business to appreciate the fact that the profits cannot stand such expenses.

Toledo. EZRA E. KIRK.

#### Will Not be Driven Out of Business.

We hardly see how it is feasible, there being such an infinite number of manufacturers to control, many of whom purchase most of the parts entering into the construction of a bicycle, simply put them together and market them, and yet they are termed bicycle manufacturers. If it were only a question of bringing in the large manufacturers, who produce machines from the material up, we think it might be feasible and perhaps in the interest of good business policy.

While we are not manufacturers of bicycles, we undoubtedly make more parts entering into the construction of a bicycle than any other house. What the effect would be on our business we cannot state. We should undoubtedly continue to turn out the parts if we could find a ready market. If this could not be done, we should most likely assemble the parts, adding to the same such as we do not now make, marketing the goods wherever we found it feasible. We certainly would not think of being driven out of the business.

If an association could be formed which would eliminate the heavy outside expenses, which do not assist in any way in the construction of the machines, we think it would be welcome to the public and might be to the interest of manufacturers.

Hartford. HARTFORD MACHINE SCREW CO.

#### Public Will Be Protected.

The combination will be the salvation of the bicycle business. The sooner it comes the better it will be. It will benefit all reliable firms and the public will be protected against scrap-heap machines, which on account of their cheapness find their way into use, and by their failure to give satisfaction work more injury to the trade than any

Toledo. CHAS. E. MELLINK.

#### OPTIONS ON MILWAUKEE PLANTS

##### Andrae and Meiselbach Return from the East—Later Enthusiastic Regarding Combination.

Milwaukee, March 27.—H. P. Andrae of the Julius Andrae & Son Company returned from the east Monday, where he had been to make arrangements for the transfer of the big Andrae plant to the syndicate when the proper time comes. In the meantime, however, and so long as the burden of secrecy is imposed Col. Andrae will not talk. "We know all about it, and we approve and are going into it, but I can't tell you anything more," said he. "Everything I have learned has been related to me in the strictest confidence and so far as I am concerned that confidence will be respected. I have just returned from the east and everything is satisfactory. So far as the details are concerned, they are left to the future to work out and when the proper time comes I suppose they will be made public."

A. D. Meiselbach of the A. D. Meiselbach company, is now in New York closing negotiations for the big North Milwaukee plant. He is enthusiastic over the plan which he designates as a "good thing" for everyone concerned. "It is certainly time that something of the kind was being brought about," said Mr. Meiselbach before he left Milwaukee. "It is necessary for the good of the trade. While I am not the promoter, nor even one of the promoters, I am satisfied that it is just what we have been waiting for. The effect will be to drive out the assemblers and do away with poor workmanship, which means of course that men will be employed in the factories in place of boys. Now there are a lot of factories that employ boys who don't know the difference between a piece of wrought iron and steel. It will be the middle of May or June before we know just how matters stand and just what the plans are, so of course the effect will not be felt until next season's work begins. We have not gone further than to agree to meet with the promoters. When I know

just what is expected I will be able to state exactly what we are going to do and how it will be done. Just look what the business is coming to. Here is a letter from a man who wants a lot of bicycles made up so that he can sell them for \$10. It can't be done, but he doesn't care how they are made nor from what they are made and he doesn't care what will be the result when the buyers try to ride them over rough roads. What we want is to make good bicycles and make a legitimate profit. As it is now there are a lot of fellows who start up early in the season and then drop out or go into bankruptcy, and after securing a big line of credit, throw a lot of cheap machines on the market, then settle with their creditors and begin business over again. When the new deal gets in working order everyone will be able to buy a good bicycle at a reasonable price.

Tandems have dropped out of the market apparently, so far as Milwaukee dealers are concerned, the only new machines that are offered being those in the salesrooms of the local manufacturers who have them there for show more than anything else. A number of second-hand machines are offered but no sales are reported. Dealers will therefore keep their tandems on hand to rent occasionally. The difficulty is ascribed by one of the dealers to the inability of ordinary riders to ride easily on tandems. Without a thorough knowledge of your partner's style of riding tandem riding becomes hard work and is soon given up after the novelty wears off.

#### British Exports and Imports.

The British cycle export trade continues to show the disastrous effect of competition in the colonial and European markets. Governmental returns for the month of February show that the exports only attained a value of \$282,290 as compared with \$474,225 for February of last year.

So far as the year has gone the foreign trade has been of a very disappointing character, the shipments during the first two months having amounted to only \$631,090, a decrease of \$333,600, as compared with the first two months of 1898.

The British cycle exports, however, are decreasing. Whereas, in February, 1898, the value of the gross imports amounted to a total of \$272,170, last month they only aggregated \$65,130. Out of this machines and parts valued at \$17,950 were re-exported, leaving the net imports for the month only \$47,180, which compares with \$216,145 in February of last year. For the two months of the new year the gross and net imports amount to respectively \$177,335 and \$76,120, as compared with \$506,655 and \$393,640 in the first two months of 1898. Thus there has been, so far this year, a decrease of no less than \$317,520 in the value of the imports of foreign cycles and material into this country.

#### Lindsay Brings Suit for Damages

Thomas J. Lindsay of Lafayette, Ind., has filed suit for damages against Justus Goebel, Robert Reynolds and Ben Kirker, of Cincinnati, in the United States Circuit Court. In his petition Lindsay alleges that he was the owner of certain bicycle models, motor carriage wheel models, with blue prints, etc., which were in a building used as a factory in Lafayette. The building was the property of the defendants, and Lindsay was employed as a superintendent. He alleges that last September Reynolds and Kirker, at the instigation of Goebel, went to Lafayette while he was absent and carried away the models and blue prints, and that he has been damaged to the extent of \$5,000.

## UNION RIDING SCHOOL SCHEME NEW ECONOMIC ARRANGEMENT

### Cleveland Dealers Establish An Academy to Be Used in Common—Agencies Hard to Place.

Cleveland, March 27.—The establishment of a union riding school for all the dealers in this city is a move which is being watched with considerable interest, as it is believed to be the first arrangement of the kind in the history of the business. The scheme of conducting riding schools in connection with the various stores has been found unprofitable, as has also the plan of employing special instructors to give lessons on the street. Still the interest in cycling shows no signs of abatement and there is more than the usual number of learners this spring. None of the local concerns, however, has cared to repeat the experiment of conducting an individual riding school. The question of a union school was broached at a recent meeting of the local board of trade and it was voted to give the plan a fair trial. A well known wheelman has been induced to secure a lease on a large hall, with the assurance that none of the other dealers will start a school of his own so long as the plan proves satisfactory. The machines for the school are secured at the various stores, each concern being given representation, the bicycles being paid for by riding tickets. The dealers agree to send all learners to the school and when a rider purchases a bicycle the dealer is allowed to furnish him with coupons good for lessons. When a rider pays for his lessons the amount paid in at the school is remitted from the price of his new mount.

#### Experiment Proving Satisfactory.

The school is advertised as a union school conducted by the local board of trade, all the concerns in the board being mentioned. The manager of the school agrees that no preference shall be given any special make, although the rider may select any machine he desires to try. In case an instructor should attempt to advocate any special machine, it is the agreement that he shall be instantly discharged and the manager failing to do so, any concern may withdraw its patronage or the entire board may cancel its contract. The plan seems feasible and the attendance thus far is proving very satisfactory to all concerned.

#### Competition Will Be Keen.

Competition in Cleveland this season promises to be the fiercest ever experienced. Out-of-town manufacturers have found it very difficult this year as in former years to secure good representation in Cleveland, and although several prominent concerns have lately placed their machines, the agencies are in several cases located in sections of the city away from the business district. A number of the small concerns in the outlying districts of the city have changed their policy with regard to handling machines made by local concerns or sold through local branch stores, alleging that the downtown stores show a disposition to make concessions in the way of exchanges and prices which the outlying dealer can not meet and as a result the rider makes his purchase from the headquarters downtown after the missionary work has been done by the small dealer. A number of them have therefore dropped local lines and will put out-of-town machines on their own account.

The hardest competition will be made this season by downtown branch stores which have increased in number lately by the addition of three concerns which

have never been represented here before. Three other new stores conducted by well known wheelmen, but said to be backed by the manufacturers whose lines they represent, have been opened on cycle row.

#### Enameling Becoming a Specialty.

The impression gained ground last fall that the number of assemblers in this section would show a decline this spring but from present indications quite the contrary will be true. However, the material houses doing business here say that the small people will do less of their own work than in former years. They have found that it does not pay to build their own frames or to do their own enameling and as a result some of the larger shops are confining themselves strictly to building frames, and the enameling business is becoming more of a specialty. This change of policy seems to be for the common good and there will probably be fewer stories of poorly constructed frames built by irresponsible repairmen.

## CANADIAN MAKERS CONSOLIDATE

### To Resist Competition from United States—Will Incorporate for \$3,000,000.

Montreal, March 27.—Last week a rumor was current both in this city and Toronto that the scheme to consolidate the Canadian bicycle manufacturing concerns as proposed by R. M. Jaffery was nearly completed. The consolidation is to be incorporated as the Canadian Bicycle Company, Ltd., with a capital stock of more than \$3,000,000 in \$100 shares, half of the stock to be preferred and half common. The companies in the deal as at first proposed were: Evans & Dodge, of Windsor, Massey-Harris Company of Toronto, Gould Manufacturing Company of Brantford, H. A. Lozier & Co. of Toronto, Welland-Vale Manufacturing Company of St. Catharines, and the Gendron company of Toronto. The plants and business of the companies will be purchased with stock in the new company, while the working capital would be supplied by the sale of the balance of the stock. The object of the combination is said to be to put the Canadian makers in better position to compete with the cheap bicycles from the United States.

Some of the manufacturers claim that there is nothing in the rumor now current while others are silent. There has been similar talk of a combination in the past, but owing to the difficulty experienced in attempting to allot the different grades of machines to the different factories the move fell through.

### Winding Up the Board of Trade.

Secretary George Hammann of the National Cycle Board of Trade—which organization is gradually expiring—expects that by May 1 his labors will be at an end. He is getting his claims in the collection department in shape to return to the owners. The committee in charge of the Board's affairs are about to remit the first dividend to the stockholders. It will be 30 per cent. It is now found that the committee cannot remit the full amount paid for stock by members admitted on August 18 last until the court passes upon the matter. Similarly with the expense accounts of the directors. If the court decides adversely on these two matters the general body of stockholders will receive about 50 per cent of the value of their holdings.

At the first Stanley cycle show held in London in 1878 there were altogether but 75 bicycles and tricycles on exhibition. At the 1898 show 2,200 machines were shown.

## SECOND-HAND TRADE A CINCH

### SOUTH DEPENDS ON THE NEGRO

#### Charleston Dealers Make a Good Profit on All Traded-In Machines—Repairer's Use of Them.

Charleston, S. C., March 27.—The net result of the second-hand exchange problem in this city in the past year was very satisfactory, the sale of old machines being about two-thirds of the number of new ones. The combined sales of all the dealers, independent of curbstone agents, amounted to about \$1,250. A close watch is kept on the illegitimate salesman, so that he has a hard time to make anything.

In regard to second-hand sales and profits on the year's business the merchants have come out on top, even considering that list prices were much lower than formerly. The demand is mostly for medium quality and price.

#### Negroes' Ambitions Easily Satisfied.

In the south there is a great advantage in the second-hand bicycle trade, due to the presence of the negro who thinks it his duty as well as his privilege to ape his white brother. Hence to ride a bicycle is his ambition, but his resources being limited, he must buy old machines. This affords the dealer his opportunity to reduce his stock. If he takes in an old bicycle at \$10 and gets the rest in cash for a new machine, he resells the second-hand machine to his negro customer for the original \$10 cash and requires him to pay, say, \$5 more in a given time, thereby making a profit on the traded-in machine and another on the whole transaction.

#### How a Repairman Draws Custom.

One dealer here who does a large repair business uses his second-hand machines as a means of drawing custom. When a rider brings in a machine to be repaired and would be inconvenienced by having it laid up for several days, the repairer lends him one of the old ones, which he takes care to have in fair running order. Or, if only a part is broken, such as a front fork, he substitutes one from his traded-in stock while the part is being mended. He says that he rarely ever fails to make a customer when once the latter finds out how little he is incommoded.

#### Good Demand for Chainless Models.

At present the outlook for retail trade in and around Charleston is as bright, if not brighter, than in previous seasons. The manufacture and sale of tandems seems to have passed almost entirely into the hands of repairmen. The demand here has never been great, owing to the poor condition of the roads. The proprietor of one of the largest retail houses has received orders for about twenty bevel gear chainless machines. These sell for \$75 cash.

### Humber & Co. Apply for Receiver.

Worcester, Mass., March 29.—Humber & Co., America, limited, has filed a bill in equity in the Superior court here against Arthur Martin and Frederick Goddard, trustees under deed of trust and mortgage upon property, and Albert E. Hawkley and the Revere Rubber company, named as respondents, asking the courts for the appointment of a receiver.

The company, which was organized under the laws of Great Britain, claims that it has been unable to pay interest on the bonds and that the property is tied up owing to suits which are now pending.

Resilient

Easy Riding

COPYRIGHT 1898 BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.  
PRESENTING TESTIMONIALS.

INDUSTRIAL SCHOOL FOR GIRLS.

MILWAUKEE WIS., December 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—I take pleasure in highly recommending your Milwaukee Patent Puncture-Proof Tire. I purchased a set of your tires early in the season, about the middle of March, 1898, and rode them constantly for three or four months, when I gave my wheel to my son, who has ridden it ever since, and given it hard and severe usage. It has never given one bit of trouble, never punctured, and I believe it to be by far the best tire on the market. I remain, very truly,

(Signed) J. R. LOVE.

OTTO GELHAAR,  
Bicycles and Sundries.

MILWAUKEE, WIS., January 9, 1899.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen:—It is with no small degree of pleasure that I add this to the many testimonials regarding the Puncture Proof Tires of your manufacture. I have used them during the past season, traveling over two thousand miles, and have never suffered the slightest inconvenience. Therefore, in view of the fact that my trips took me through as rough a country for cycling as can be found, I strongly recommend your tires to those who want to be "in it" at the finish. Yours respectfully,

(Signed) OTTO GELHAAR.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries, \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## WHY MAKERS WISH TO COMBINE

If two live competitors in any line see clearly that by forming a partnership they may reduce their operating expenses while also increasing their gross receipts, they will combine whether their political or moral creed be of the highest or the lowest order. But if they are wise and wish to forestall new competition of the same kind which they had given one another before the combination, they will refrain from any attempt to market goods at more than reasonable profits, especially if their goods are articles of luxury and if they may be produced economically without a heavy investment of capital.

What two will do many will do if the opportunity is offered, and the difficulties in the way of unifying personal variations of opinion may be overcome; and it is therefore not at all wonderful that the majority of bicycle manufacturers are at present seriously considering the preliminary propositions for a consolidation of the competition-riddled bicycle industry, which have been laid before them.

Whatever may be their personal convictions in regard to trusts and combines in general and the means for regulating them, they are too conversant with the nature of their own business and its relations to the manufacture of component parts and assembling in small shops to believe for a moment that any amount of consolidation could result in higher prices for bicycle values than those now prevailing. The project which has been broached to them promises no new methods for gouging the public, but it seems to promise them a considerable saving in cost of production, an improvement in the average quality of bicycles and a certain safety against the mishaps of the bitter struggle for supremacy to which the present conditions are leading up.

Whether these promises are well founded or are only iridescent bubbles filled with the hot breath of Wall street promoters, is the question which bicycle makers are now taking ample time to ponder.

A letter received from one manufacturer will indicate the trend of the thoughts of many. He writes:

To the Editor.—I have read your comprehensive report of the bicycle combine and am glad to say that you have handled this affair in a masterly manner. You have hit the nail on the head pretty squarely.

I have but one criticism to make: I do not believe in raising the prices of bicycles. There is no necessity for it. As a matter of fact, the combination will bring about a higher average price, and that is what is necessary.

As a matter of curiosity, a few days ago I figured up to see how many wheels we could put up of the different models that we are manufacturing, and with the different options on each model, without having two alike. It ran way up into the thousands. For instance, we are manufacturing twelve distinct models. Each of these models is supplied in three sizes of frames. Each size of frame is finished in five distinct colors. Each color is supplied decorated, plain, or striped; three different styles of decorating. Each size of frame requires a different size of fork, so that we are obliged to have a fork for every frame. A very little figuring will show what an immense number of frames we must carry in stock in order to have twenty-five of each kind ready for immediate assembling upon receipt of an order. Carry this combination through the entire options, including the gears, the different sizes of chains, the rims, the lengths of cranks, and then the tires, varying in size according to the whims of the public, and you have a line of options that is almost endless. Could these options be reduced to a reasonable point, we could save from \$1 to \$3 a bicycle during the season.

In spite of anything that we can do we are obliged to carry over into the next year a stock of from 2,500 to 3,000 machines, in order to be able to supply the very limited demand which we have after the season is closed. The interest on the large investment necessary to

carry this stock is quite an item in itself. The depreciation in value by reason of carrying over is another large item, and can never be overcome until we have fixed patterns and can run the same style more than one season.

All of this trouble can be remedied and overcome by a combination. It means many dollars' profit to the maker. The dealer will also be in a position where he can place on his floor a stock of wheels on which he can reasonably expect there will be no great amount of loss in case he carries goods over into another season. It will enable him to order stock during the dull season, at a time when we can get the goods out to him assembled in a much better manner than when done in a rush. There really is hardly any limit to the saving for the manufacturer, from a manufacturing standpoint, in this direction only.

There are also a thousand and one other evils, which are of no direct benefit to the rider of a bicycle, that can be done away with by the combination. The matter of credits can be better handled. Spring datings can also be adjusted. For instance, we are now carrying, and have carried for sixty days, customers to the tune of over \$100,000. The interest on \$100,000 for sixty days at 6 per cent is quite an item in itself, yet we have been obliged to pay it, simply because we were obliged to meet other competition, and date our invoices April 1 in order to get the goods out of the factory during a dull season, and not have all of our business to do in the months of April, May and June.

I cannot believe that the promoters of this combine are blind to all of these advantages. Could this concern avoid these evils, we could produce a better bicycle, one which would be better for the rider, and consequently better for us, and sell it at our present prices, and make double the profit we are now making on it. My opinion is that a combination which will do away with the present evils of the bicycle trade will result in a generally lower price.

## MAKERS, SALESMEN AND AGENTS

Much of the friction generated by the various elements of the bicycle trade is due to the fact that a large proportion of the manufacturers and retailers misunderstand the relations which exist between them. As a rule the manufacturer thinks that he is controlled by the dealer, and so strong is this conviction that it influences him in his whole business policy. He pleads the arbitrary requirements of the dealers as an excuse for all his departures from a wise and conservative course; and while he might not confess in so many words that he considers himself of secondary importance in his trade to the man who sells at retail, he frequently makes this confession in effect when he says anything about his policy and advances his reasons for it. Evidently there is a misunderstanding somewhere. The manufacturer often imagines that he is bulldozed into making what he does not in all respects like, nor in all ways approve; and, on the other hand, the dealer often imagines that he must take what is given him by the manufacturer as he would a dose of medicine. Why is it that the makers entertain notions so far from the truth about the demands of the dealers?

The answer to this question is found in the fact that, to a very great extent, the communication between manufacturers and dealers is conducted at second hand, through the medium of the traveling salesman. For the traveler the Cycle Age has every respect and has more than once defended him against unjust aspersions on the ground that he is a necessary agent, without whose help the distribution of cycling products could not be effected so rapidly, economically or satisfactorily as now. But the traveler is in a position which forces him to look after his own interests as well as he can. It is he who interprets the demands of the dealer, and from him the manufacturer gains, largely, his impressions of what the dealer wants. The traveling man also interprets public opinions to the dealer who, often in spite of his better judgment, orders what his customers do not exactly demand, or out of proportion to the possibilities of his trade. While the traveler may be perfectly honest, he may at times deceive both manufacturer and retailer, and establish between them a false relation, which accounts for much of the misunderstanding which may be seen in the trade today.

The dealer's true position in trade is that of a middleman. He does not control the trade; he does not dictate styles or fashions, and he usually accepts them mainly because he feels that he must. The real arbiter of the whole matter is the traveler, and this fact explains many of the anomalies of the bicycle business. So far as the dealer is concerned, he will buy whatever he can sell to advantage, and he can sell whatever there is a demand for. If the manufacturer creates a demand, the dealer will buy and ask no questions.

## BRAZING BY IMMERSION

### Patent Granted on Columbus Bicycle Company's Method of Dipping—Table of Brazing Expenses

Members of the bicycle manufacturing trade have lately received letters from the Columbus Bicycle Company of Columbus, O., notifying them that if they are using the process of liquid brazing and immerse the joints to be brazed in the spelter bath by first passing them through a superposed body of flux and subsequently subject the joints to the action of the flux by holding them in the flux for a determinate time or withdrawing them slowly—then they are infringers on the rights secured by letters patent No. 611,922 issued to Thomas Midgley and Lewis Fink, assignors of one-half to the Columbus Bicycle Company.

#### Essential Features of Patent.

In order to enable the recipients of the letters to judge of their legal position the essential portions of the patent document referred to and the illustration accompanying it are herewith reproduced, as follows:

References being had to the drawing and the letters thereon, A indicates the masonry of an ordinary brass-founder's furnace; B, a crucible in the well of the furnace; C, the gas and blast supply pipes.

"The flux is preferably placed upon the surface of the molten bath for economy of operation; but it is obvious that for some purposes it may be heated and used in a separate vessel.

"For the purpose of illustration, F indicates the hub of a bicycle-wheel immersed in the bath D.

#### Cleaning Effect of Flux.

"The articles or joints to be brazed are prepared in the usual way—namely, by carefully removing all grease or other foreign matter, then assembling the parts and securing them in position by suitable means, such as pins or clamps. The article or joint is then preferably passed down through the flux E, which is maintained at a depth of three or four inches and properly fluxed. Then without exposure to the atmosphere it is immersed in the molten metal and allowed to remain until the metal parts to be brazed or soldered have all reached the same temperature, when the article is slowly withdrawn from the bath and without exposure to the atmosphere allowed to remain in the superposed body of a flux a determinate time either by permitting it to rest in the flux or moving it through the flux more slowly when it is withdrawn from the molten metal, the effect of which is that the chemical action of the flux at its high temperature drains or wipes off the surplus metal adhering to the article without loss of metal and produces a clean, bright finish with all the crevices and pores of the article filled, and the surfaces have nothing more than a thin film or wash on them, the borate having acted as a stripper to the excess of metal on the surface and the surfaces being in a superior condition for a subsequent coating of metal by electroplating or nickelplating or galvanizing.

"Having thus fully described our invention, what we claim is—

"The process of brazing or soldering metals, which consists in immersing the joint in a bath of molten metal through a superposed body of flux, then stripping or wiping off the excess of metal by subjecting the joint to the action of the said body of flux for a determinate time while being withdrawn from the bath of molten metal."

#### Cost of Brazing in Columbus Factory.

The Columbus people are old hands at immersion brazing and have brought the process by systematic practice to a low point of economy. At least they have given such attention to it, used it so constantly and on such a broad scale, that they have been enabled to figure out with comparative exactness the cost of performing the operations necessary after the frames are taken from the frame building department and before they are turned over to the enamellers for the ground coat of enamel. The table of such

costs as compiled by the company is substantially as follows:

	Per 100.
Dipping rear ends . . . . .	\$ .21
Grinding rear ends . . . . .	1.50
Dipping rear stay tips . . . . .	.19
Grinding rear stay tips . . . . .	1.25
Dipping steering heads . . . . .	.41
Grinding steering heads . . . . .	2.50
Dipping remainder men's front frames . . . . .	1.00
Grinding remainder men's front frames . . . . .	3.00
<b>Total dipping and grinding on men's frames . . . . .</b>	<b>\$10.06</b>
Flame brazing cross braces and rear forks to bracket . . . . .	\$ 3.00
Filing braces and hanger . . . . .	28.00
<b>Total flame brazing and filing on men's frames . . . . .</b>	<b>\$31.00</b>
<b>Total cost of brazing and finishing men's frames . . . . .</b>	<b>\$41.06</b>
Additional cost of dipping women's front frames . . . . .	\$ .33
Additional cost of grinding women's front frames . . . . .	1.25
Additional cost of filing women's frames . . . . .	3.00
<b>Total additional on women's frames . . . . .</b>	<b>\$ 4.58</b>
<b>Total cost of brazing and finishing women's frames . . . . .</b>	<b>\$45.64</b>

Dipping seat posts . . . . .	\$ .33
Grinding seat posts . . . . .	1.50
Polishing seat posts . . . . .	.50
<b>Total cost of brazing and finishing seat posts . . . . .</b>	<b>\$ 2.33</b>
Dipping handle bar stems . . . . .	\$ .26
Grinding handle bar stems . . . . .	1.25
Polishing handle bar stems . . . . .	.75
<b>Total cost of brazing and finishing handle bar stems . . . . .</b>	<b>\$ 2.26</b>
Dipping fork crowns . . . . .	\$ .50
Grinding and strapping fork crowns . . . . .	2.00
Polishing crowns and tips . . . . .	2.00
<b>Total brazing and finishing forks . . . . .</b>	<b>\$ 4.50</b>

#### Spelter Removed By Grinding.

It will be noticed from the foregoing that while sand blasting and pickling are not included in the company's practice, the amount of filing necessary in finishing the frames is lessened by the use of the grinding wheel. Though several factories use the grinder to remove large lumps in certain easily reached places on the frame, its extensive use is but seldom adopted. There is, however, one other notable instance of the use of the wheel.

The White Sewing Machine Co., of Cleveland, has in its frame department a number of grinding wheels, each intended for some especial purpose, by means of which the main portions of nearly all of the joints in the frames can be ground clean. The use of the grinder is but another point for consideration in the important question of frame cleaning which is at this time receiving much attention at the hands of factory superintendents and frame room foremen.

#### Flame Brazing an Expensive Fad.

In the Columbus factory the front frame parts are assembled, brazed together and finished before the rears are attached. Though no exact reason can be gathered from the table, it is evident that the men in charge in this shop consider it good practice to braze the rear forks to the hanger on a flame brazing table. The figures also show that while the entire cost of brazing the front frame together by the dipping process is less than one and one-half cents, the cost of brazing the rear forks to the hanger and the cross braces in the rear frame by the flame method is three cents, or more than twice as much. It is thus apparent that if there is no objection to the practice of those factories which braze the entire frame in the immersion crucible a large proportion of frame brazing cost is wasted by using the flame in brazing the rear forks to the bracket. With justice to the Columbus people, however, it may be said that their reason for attaching the rears after the fronts have been

dipped is doubtless to make more extensive use of the grinder in clearing the hanger from brass after dipping. The attachment of the rear forks would limit to a certain extent the areas which could be reached by the wheel.

The question, taken as a whole, thus resolves itself into one of those logical circles in which the many points to be considered are so related to each other that the course of reasoning employed keeps coming round to the starting point and leaves the reasoner in doubt as to the ultimate policy which had best be followed. It is still an open question as to whether means should be developed by which spelter can be economically removed, or whether such means should be disregarded and attention given to the production and application of anti-fluxes which make spelter removal and frame finishing practically unnecessary.

#### Comparative Filing Costs.

Without doubting the statements of cost in the foregoing table it appears that, other considerations being dropped, the

price mentioned for filing the crank bracket and cross braces after flame brazing is somewhat high, it being given as twenty-eight cents per frame. There are many factories where all the joints of the frames produced are brazed by immersion and where the total cost of filing the frame is but thirty-five cents; in fact it is doubtful if there are many factories where more than this latter amount is paid for filing complete frames. The Columbus company, while it has not compiled any figures on the subject, is authority for the statement that immersion brazing systematically operated results in a saving of all materials used in frame brazing and finishing, such as spelter, fuel, files, etc., and roughly estimates this saving to be at least one-third.

**DRUM UP COUNTRY TRADE**

**Cut-Price Buffalo Concerns Make the Most of Bad Weather—"Big Store" Tactics Win.**

Buffalo, March 27.—The stormy weather of the past week had the effect of taking much of the cycle enthusiasm out of the riding public and as a consequence business has fallen off temporarily to a considerable extent, but notwithstanding these conditions the general business shows a marked increase over that of the same period last year and the prospects are good for an early return of activity as soon as the weather clears.

The inclement weather put a sudden stop to the advertisements of those cut-price concerns that had been indulging so freely in the use of printer's ink, and they bent their efforts in another direction, sending their employes into the neighboring country towns to drum up trade. This was anything but a successful experiment, for with a foot or more of snow on the ground and the wind blowing a gale from every quarter, it was found a difficult matter to interest the country folk in anything pertaining to the bicycle.

A story is going the rounds of the Buffalo cycle stores that has to deal with the introduction of a representative of one of the prominent out-of-town manufacturers into department store tactics. As the story goes, the store in question contracted for a certain number of cycles last season and as the season progressed and the stock did not diminish as rapidly as was anticipated, the proprietors decided to reduce the prices of the different models. A sale was announced in display type in the daily papers, and the manufacturer, becoming cognizant of the contemplated slaughter of his reputation and product, dispatched an emissary post haste to Buffalo with instructions to head off the sale. Upon arrival the representative informed the head of the concern in no uncertain terms that his tactics would not be tolerated. "It's an outrage," he is reported to have said, pointing his finger at a machine that was decorated with a placard in letters that could be read across the street, "to sell a wheel like that for that money." The merchant replied, with a look akin to contempt: "We bought and paid for these bicycles and it is our purpose to dispose of them at our best advantage. We advertise to sell them at those prices and we purpose doing so. If our methods do not meet with your views we stand ready to sell them to you at the same price that we offer them to the public." And the sale went on.

**Elgin Bicycle Co.'s Affairs Adjusted**

The legal differences between M. C. Epenstein of the Illinois Watch Case Company of Elgin, Ill., and Mr. Duncan, formerly a stockholder and director of the con-

cern, have been settled out of court, the action begun by the company against Mr. Duncan for an alleged sum owed to the company having been withdrawn.

The company is directing its efforts at present toward retiring from the bicycle business as speedily as possible.

**PAY JUNK DEALERS' TAX**

**Dealers Who Trade in Second-Hand Cycles Held to Be Subject to License.**

Washington, March 27.—The Court of Appeals for the District of Columbia handed down a decision last Friday in the test case brought by John D. Lasley against the district to determine the validity of the act of Congress, approved March 3, 1891, imposing a tax of \$40 per annum upon every dealer in second-hand personal property. The court held it to be compulsory for all such dealers to secure a license in order to conduct such business, although they may have already procured a license to carry on the sale of new goods of the same kind.

The court, in delivering the opinion, stated that the law on the matter is conclusive and plain, and requires a dealer to procure a license before engaging in the purchase and sale of second-hand goods. The only substantial point to be settled, it was stated, is whether or not the act of Congress giving the District commissioners authority to make such municipal regulations is valid. In reference to this the court says there seems to be no reason for contention, and the decision in the Stoutenburg-Hennick case, in which the point raised was whether or not a commercial traveler could be compelled to pay a license, was cited. The case was taken on appeal to the Supreme Court of the United States, and the regulation was held to be valid. The fact that Mr. Lasley was conducting a principal business of dealing in new bicycles, the court maintained, does not relieve him of the duty and obligation of obtaining a license to deal in second-hand machines, or any other class of second-hand goods. The regulation, the court said, is explicit.

In accordance with this decision, all dealers in bicycles in this city who handle second-hand machines will be required to pay a tax of \$40 per year as all dealers in second-hand goods are required to do. They will comply with the law and will not take the case to the Supreme Court. It is probable, however, that the matter will be brought to the attention of Congress at the next session and an effort will be made to have the law so amended as to relieve bicycle agents and other legitimate dealers from the tax.

**Michigan Bicycle Bill Defeated.**

The Davis bill to make bicycle stealing a felony and punishable as such has received temporary defeat at the hands of the rural representatives in the Michigan legislature. The farmers denounced the bill as class legislation, forgetting the special rulings for the protection of orchards, etc. Adherents of the bill managed to get the vote reconsidered, however, and the bill tabled so that it is liable to come up again at some more auspicious time.

**Machine for Making Spiral Gears.**

The increasing favor with which spiral gears are being considered in the machinery world is evidenced by a patent secured by W. G. Burnham and assigned to the Brown & Sharpe Manufacturing Company. It is for a machine designed for cutting small spiral gears accurately and automatically. Even for bicycle gearing the spiral gear meshing with an-

other spiral gear has been proposed and the old prejudice against this form of gear arising from its similarity to a worm-gear and the assumption that an excessive end-thrust is inseparable from its use, is giving way to a better understanding of its usefulness for transmitting power at angles near to 90 degrees. With the end-thrust largely absorbed in ball-bearings and the gear teeth scientifically cut two spiral gear cylinders with the teeth at 45 degrees with their respective axes may apparently drive in mesh with one another without any but rolling contact. The patent is No. 621,519, dated March 21, 1899.

**LOW TRADING-IN PRICES**

**Nashville Dealers Make Cash Sales by Discouraging Exchange Custom—Repair Charges.**

Nashville, March 27.—The second-hand exchange problem was worked out very satisfactorily to the dealers here last year. The allowance on second-hand machines traded in was from \$10 to \$20, never exceeding the latter figure on the best-make of machines. This resulted in comparatively few trades being made, as a great many riders preferred to sell their old machines themselves and then make cash purchases from the dealer. As a consequence the demand for second-hand machines exceeded the supply and the dealer was enabled to clear from \$2 to \$5 on all bicycles exchanged and invariably had a clean stock.

The riders have now become educated to the fact that their old machines are worth little and show a disposition to trade in at the dealer's figure. The generally lower list prices will help matters this season, for although the rider gets little for his old machine he has a smaller difference to pay than formerly.

Altogether the experience of the dealers last year and the outlook for '99 with regard to accepting second-hand machines in exchange, are considered by the dealers as very satisfactory.

By common consent the following charges for repairs and rentals are recognized as standard here:

Repairing broken top or lower tube, frame re-enameled . . . . .	\$5.00
Broken top and lower tube, frame re-enameled . . . . .	6.50
Broken seat post tube, frame re-enameled . . . . .	5.00
Broken rear fork, one side, frame re-enameled . . . . .	5.00
Broken rear fork, both sides, frame re-enameled . . . . .	7.00
Inserting one new fork side, re-enameled . . . . .	2.50
Two new fork sides, re-enameled . . . . .	3.50
New fork stem, re-enameled . . . . .	2.50
New fork crown, re-enameled . . . . .	3.50
Enameling, plain, any color . . . . .	3.00
With decorations, any color . . . . .	3.50
New rim . . . . .	2.00
Wheels re-spoked . . . . .	2.00
One spoke put in . . . . .	.25
Each additional spoke . . . . .	.10
Truing wheels . . . . .	.25
Repairing puncture in double tube tire . . . . .	.50
In single tube, one plug, guaranteed . . . . .	.50
In single tube, one plug, not guaranteed . . . . .	.25
Putting metal base stem in single tube tire . . . . .	.75
Valve stem vulcanized in single tube tire . . . . .	1.00
Valve stem in double tube tire and cementing . . . . .	.65
Cementing tires, each . . . . .	.25
New cranks, regular stock . . . . .	.75
Brazing front sprocket . . . . .	1.00
Fitting new rear sprocket . . . . .	2.00
Crank axles made and fitted . . . . .	2.50
Front axles made and fitted . . . . .	.50
Rear axles made and fitted . . . . .	.75
Pedal pins made and fitted . . . . .	1.00
Cleaning bearings . . . . .	1.00
Adjusting all over . . . . .	.25
Oiling all over . . . . .	.10
Link put in chain . . . . .	.25
Lacing chain guards . . . . .	.25
Rear wheel guards . . . . .	.25
Renting—One hour or less . . . . .	.25
Each additional hour . . . . .	.15
Six hours . . . . .	.75
Twelve hours . . . . .	1.25
Twenty-four hours . . . . .	1.50
At night, per hour . . . . .	.50

## SUBJECTS OF GENERAL INTEREST

### INDUSTRIAL SECURITIES OVERVALUED

In two months this year there have been placed on the market \$1,048,800,000 of industrial or new trust securities. This does not include \$403,000,000 in various projects, planned, started, often organized, but not completed.

These issues, made in only two months, put on the market and sold to the public, are larger in the aggregate than all the industrial securities floated in all of 1898, which were in all \$916,176,000. These issues in two months are greater than all the listings, shares and bonds together, made in any year on the New York stock exchange, except one.

In two months, of one particularly risky class of security, valued and organized on a new basis, whose future cannot be predicted, the American investor has been asked to take more in sixty days than he has before taken in a year of all securities, including the soundest. The peril of this sort of thing is plain. The end is inevitable. These vast, swollen overcapitalizations may be kept at their present prices for a season, but a day of reckoning is sure to come. Their management is not open to investigation. Those who control them are making money now by marketing them at a high price, and when that is done there will be just as much money for inside managers in breaking the price.

Nothing can be clearer than that these securities do not offer the proper field for the small investor or for small savings. The craze for them will pass, as have all other like lunacies.

### INTERESTING MECHANICAL FRAUDS

The mystery of Keely's motor has quickly followed its inventor to the grave. The opinion generally held by scientific and practical men, that it was grounded in fraud or fallacy, has at last been proved beyond a reasonable doubt. Since the discovery of metal tubing artfully concealed in the walls of Keely's laboratory and of a large iron or steel sphere adapted to serve as an air or gas reservoir, under the floor, together with other corroborating evidence, it is morally certain that the machine supposed to turn in sympathy with the vibrations of a tuning fork, was, in reality, operated by ordinary air under pressure, and that the wires said to convey the subtle currents of etheric energy were, in fact, minute tubes through which the air flowed.

Keely's imposture has had many prototypes. Some interesting examples of mechanical frauds have been collected by President Morton, of Steven's Institute of Technology. One of them, which acquired publicity at the beginning of this century, in Philadelphia, was the Readhefer perpetual motion machine. In 1812, the Pennsylvania legislature, being applied to by Readhefer for funds to develop his invention, appointed a committee to investigate it. On that committee was Nathan Sellers, who was accompanied to the inventor's shop by his son, Coleman Sellers, later the father of the present distinguished engineer of that name. When they arrived at the shop they found the door locked, and had to make their investigation through a barred window. Young Sellers, though a mere boy, was observant enough to notice that the teeth of certain pinions ostensibly driven by the machine were frictionworn on the wrong sides, which indicated that instead of

having power transmitted to them these wheels must have transmitted the power to the motor from a hidden source, which subsequently was shown to be a fact.

Twenty or more years ago an inventor in Newark, N. J., exhibited an apparatus in which mechanical operations requiring several horse-power were performed apparently with the current generated by a small galvanic battery, which, according to the laws of nature, was inadequate to accomplish such results. Several prominent men were induced to advance capital for the enterprise. It worked well for a while and then stopped. The peculiarity about its stopping was that this occurred just at the time the steam engine, which furnished power for sundry purposes in the building, was wont to shut down for the day. Subsequently, when the inventor had fled from his stockholders, his machine was found to have a hollow frame permitting the introduction of a belt to convey from a lower floor the power that ran it.

### REMARKABLE RAILROAD INVENTION

Ever since the railroad became a necessity in the life of civilized nations the invention of a feasible plan by which a railroad could be constructed and operated, using a single rail, has been the hope of many engineers of the highest attainments. Several single-rail roads have been devised and some of them have been tested with indifferent success; but cheapness in construction, rapidity in the moving of trains and reduction in cost of operation have made the single rail especially desirable in solving many of the perplexing problems in transportation. Since the greatly increased use of electricity as a motive power the exertions of engineers to hit upon a safe, cheap and practical road using one rail have been redoubled and it seems they have finally been successful.

The credit of this discovery, or invention, belongs to an Englishman named Behr, who has put his plan into successful operation in Belgium, over a short line of road near Tervuerne, over which he has moved his trains at the rate of two miles a minute, the cars being of ordinary size, capable of seating 100 passengers. The invention has attracted the attention of practical railroad men to such an extent that a line is to be constructed from Manchester to Liverpool, a distance of sixty or seventy miles, the construction of which is to begin within the next two months. Fabulous stories are told as to what may be expected when the new line is built, and it is affirmed that 1,000 miles in twelve hours will not be more than the ordinary speed of the trains.

From the rather condensed descriptions of the new road that have been published it appears that the trains run upon a single rail, supported upon a trestle some feet from this ground, which avoids the necessity of an ordinary roadbed of earth. The cars are sixteen feet in length, suspended from the rail and kept in place by guide wheels that bear upon the top and sides of the rail. Each car has four electric motors, weighing three tons each, supplied by a contact rail, laid parallel with the track, having 150 horse-power each and capable of 600 revolutions, each of which would give the car a speed of 100 miles an hour, and this speed is capable of being indefinitely increased. From the contact rail electricity is conveyed to the

motors in the car by copper wires. The cost of this mono-railroad is estimated at from \$50,000 to \$100,000 a mile, which is considerably more than that of the ordinary surface double-rail road, but the inventor claims that the greatly reduced expense of operating the former will far more than compensate for the increased cost of construction.

The invention has passed beyond the experimental stage, and while all that is claimed for the new system may not be immediately realized there is little doubt that it marks a very long advance in the solution of the problem of rapid transit for long distances.

### PLATINUM PRODUCTION IN AMERICA

It is predicted that this country will soon be the greatest producer of platinum in the world. As yet four-fifths of the supply of this product is obtained from mines on the slopes of the Urals, near the boundary line between Russia and Siberia. The principal reason why the bulk of the platinum used in this country has been hitherto derived from the Urals is that labor is much cheaper there. Gravels which have been washed down from the mountains for centuries contain the deposits. Miners dig into the ground to a depth of fifteen feet or so, and then tunnel in all directions. The stuff they throw out accumulates in summer, and in winter it is washed. Gold is what they are searching for in reality, and the platinum is merely a by-product. Twenty-nine hundred cartloads of gravel yield only about fifteen pounds of platinum.

The difficulty and labor which is entailed in separating it from the accompanying substance is so great that the product itself is necessarily very expensive. Its present market price today is \$9 per ounce. Rich placer mines of platinum are frequent on the Pacific coast of the United States, especially in Oregon and California. Both of these states would long since have become great producers of platinum but for the cost of separating it from a mixture with which it is always associated.

In this mixture is found osmium, which is one of the most interesting substances in nature. If a little of it is exposed to the air it is instantly transformed into osmic acid, which is a most deadly poison. This peculiar quality may be utilized in a most advantageous manner, for if the filament of an electric lamp be saturated with it, it will carry a current about four times as strong as can be passed through it without the same treatment. With the same strength of current it will give much more light. The reason that the current is increased by this treatment is that osmium will not melt in a vacuum, and so an indefinitely strong current can be passed through it.

In 1879 five pages of Harper's Magazine were devoted to the exploitation of a magnetic motor devised by one Gary, of Boston. It was supposed to operate through the periodical introduction of a shield in front of a permanent magnet, and to produce effects which would have been inconsistent with the principle of the conservation of energy. As a matter of fact, the magnetic shield, made of iron, was moved by hand, and its manipulation against the attraction of the magnet must necessarily have put into the machine all the energy that was given out through this device.

## "BUILT LIKE A WATCH"

### THE STERLING BATHING GIRL IN A NEW ROLE.

STERLING BICYCLES have acquired the enviable reputation of being the most substantial, the lightest running, and the most favorably spoken of machines on the market, because of the quality of material and class of workmanship used in their construction, and the careful attention given to details and finish.

STERLING ADVERTISING has been extensive but judicious, and the attractive matter supplied to agents has been largely instrumental in bringing the wheel into prominence.

### THE BEACH SCENE IN THE ACCOMPANYING CUT

is from the famous Sterling poster, the best known and most talked of poster ever before the public.

It now appears upon an edition of handsome PLAYING CARDS of the best quality, which will be furnished broadcast at less than a third of their value. A background in Sterling olive surrounds the halftone in the center, the "ad." being confined to the back of the cards, and the faces free from fancy designs.

Sample package by mail for 20 cents in stamps, one dozen by express for \$1.75.

A WORD TO BICYCLE DEALERS. The present year will be the best in bicycle history, with a vastly increased demand for the acknowledged high grade makes. If you are not already satisfactorily provided for, we would like to say a few words to you upon the subject of agency, and your correspondence is invited.

### Aligning Holes in One-Piece Head Tubes—Half-Hearted Experimenting with Dip Brazing

Many manufacturers using flush joints make their steering heads from a single piece of tubing in each end of which is punched a hole through which is subsequently passed a flashed reinforcement which laps around the inner wall of the tube. The frame tube is then slipped on over this reinforcement, or branch, the end being scarfed to fit against the head tube. The punching of the holes in the head tube is very simple as it is done in a regular vertical press, the tube being slipped on over a horizontal mandrel and up against a shoulder during the operation. The first hole is punched without

regard to alignment, of course, but the punching of the second hole, at the other end of the tubing, must be done in perfect alignment with the first one and, as the eye of the workman cannot be depended upon in such a case, mechanical means must be employed. The accompanying illustration shows two methods that have been used in factories.

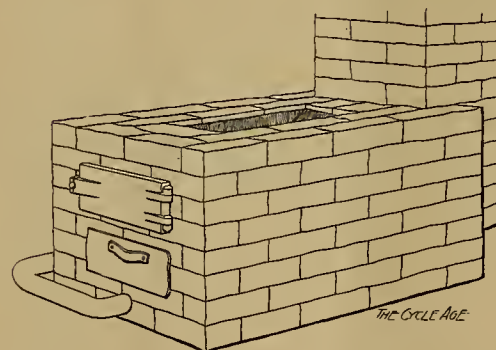

According to the first plan a horizontal rod is rigged up on supports from the frame of the press, the rod being parallel to the mandrel holding the tube and a short distance below it and to its left. A collar is fitted to slide back and forth upon this rod and may be fastened with a set screw at any desired point. An upward rigid projection or arm from the collar connects by a vertical hinge joint at its upper extremity with a swinging arm having a hand piece at its free end and near its middle a vertical hub bored to receive the arbor of a gauge matching the holes which are punched in the tube. The swinging arm can be adjusted, by moving the lower supporting collar on its inclosed rod, so that when it is dropped to its lowest normal position the attached gauge piece will enter the punched hole in the head tube. When not in use the gauging arm may be swung back till the small stop lug near its hub rests against an engaging lug on the vertical support. After the first hole in the hub has been punched the tube is pulled off the mandrel and turned around. The gauge is then lowered and the tube turned on the mandrel till the hole al-

ready punched is in such a position that the gauge piece will drop into it. The other hole is then punched.

A simpler form of gauge is illustrated in the two lower views. The horizontal rod is placed about even with the top of the tube mandrel and holds a sliding block with a flat horizontal top face. To this face is fastened by a screw a long flat spring which extends somewhat to the right of the mandrel. On the lower side of the spring and over the mandrel the gauge block is fastened. The spring in the flat bar tends to press it downward. As it may be swung horizontally from its left end the bar may be sprung upward enough by lifting on its free end with the hand to allow it to be turned from an out-of-the-way position at the left to its gauging position over the mandrel. Then when the hand is taken from the right end the spring will force it downward and when the head tube is turned till the hole is in the correct position the gauge block will drop into it. The hole in the other end of the tube is then punched.

#### HOW DIP BRAZING IS REJECTED.

A bicycle manufacturer who felt bound to experiment a little with dip brazing, but did not have the heart to go at the work systematically, was approached by a workman, who claimed to know the art, and commissioned this person to erect a furnace and teach the factory men what he knew. The builder of the furnace had the very general knowledge about immersion brazing furnaces that there should be a crucible supported over a fire box, the whole to be contained in a fire brick structure. The accompanying illustration shows the exterior view of the furnace as erected. The crucible was supported by the brick work, which entirely covered the top, leaving only the crucible open. The crucible was tightly cemented in place, no provision being made for expansion or warping after heating. The fire box was directly under the crucible and was reached by a door

in the front end of the furnace. Below the grates a space was left for the accumulation of ashes to be cleaned out through an opening directly below the fire box door. This opening was closed by a thin iron plate. The draft came into the furnace through a single pipe leading into the front of the fire box. The fire when built produced a sufficient amount of heat but this heat instead of being forced up around the crucible and over the top of the molten metal, could, on account of the restraint of the fire brick top and walls, reach as high only as

about three inches from the bottom of the crucible. It was then forced out by the rear of the furnace and through a chimney arranged for the purpose. The chimney, it is said, was the hottest part of the entire furnace, while the top position of the spelter was chilled too much to flow. By heating up more the zinc was burned out and the spelter again refused to flow. After this experiment the bicycle manufacturer temporarily rejected brazing by immersion.

#### THEIR TROUBLE FOR THEIR PAINS.

Few factories exist that have not one or more special shop schemes for obtaining accuracy in the making and assembling of parts, but though the motive is a worthy one the results are frequently incongruous with the aim.

In a large factory the finishing work done on slots in the rear end lugs of the frames presents an example of such wasted pains. Following the common method the rear stays and forks are brazed to the rear lug before they are joined to the front frame. That is, a rear stay cut to the proper length is pinned to the lug, to which also the mating rear fork is secured. The three parts are then brazed and the joint filed up. In order to get an accurately filed, properly

shaped slot for the reception of the rear wheel axle the joint is sent to a second filer whose sole duty it is to file out the slot to the gauge of a metal templet like that shown in the accompanying illustration. When subsequently the rears are put into the frames, the entire frames have been brazed and filed and sent to the liner, it is unfortunately found in ninety-nine cases out of every hundred that a rear wheel if put into the frame will not lie centrally between the rear stays and between the forks at the same time, and the liner is now required to file off some metal from the upper side of one of the rear slots according to the direction in which the wheel inclines. In so doing he enlarges the slot and places at naught the carefully gauged work of the filer with the templet.

#### Every Rider an Agent.

They have a new scheme in England for selling bicycles, whereby each customer becomes an agent. Certain makers advertise to supply customers with bicycles for \$1.25. On the payment of this sum the customer is given a coupon, and this coupon is returned to the makers with \$7.50. For the \$7.50 a certificate is issued containing six coupons, each valued at \$1.25. These six coupons the purchaser is expected to sell to six friends for \$1.25 each, which repays him for the \$7.50 which he has paid. Then the customer's friends are expected to do what the original investor has done. Supposing, however, that only four friends in place of six send in their applications for machines and agencies; the first purchaser is blandly told that there is nothing to prevent him from paying \$18 more, on receipt of which the machine will be sent to him.

to the Senate, have been compelled to recall the bill and shelve it for indefinite postponement. The concerted opposition of the cyclists of the state was so strong that the assemblymen did not dare send the bill to the Senate, upon whose members the wheelmen had been showering petitions and personal letters from the time that the adherents of Guth first began to gather dangerous strength. Chief Consul Van Valkenburgh was instrumental in stirring the cyclists up to action. The measure was a direct blow at cycling outside of cities and towns and provided that every wheelman should turn aside upon meeting any other form of vehicle and give that vehicle the entire roadway.

### NEW YORK SPRING CYCLE SHOW

Dealers' Exhibition Opened Thursday—Fifty-One Retailers Represented—Sundries Prominent.

New York, March 27.—The Dealers' spring cycle show opened at Grand Central Palace last Thursday night. It will continue throughout this week. It is a dealers' show pure and simple, the management having had it in mind all along to make it such and having so advertised the affair. The booths contain the exhibits of fifty-one representative dealers, each of whom in most cases shows several different makes of bicycles. Sundries and specialties of all descriptions form an important part of the show and in many booths are side lines that cycle dealers have found to be suitable for their business.

Some of the local dealers refused to attend the show, giving as an excuse that the spring activity demanded their attention at their stores, but the number of dealers exhibiting and the interest shown by the visitors are satisfactory both to the management and to those dealers represented.

A fair proportion of the admission is paid and the visitors as a whole show more buying spirit than has been common at shows. One exhibitor reports that he has already made twenty sales and nearly all of the dealers say that there has been direct selling value obtained from the show. One of the side features of the exhibition is a small track in the building on which intending purchasers may try any machines which have taken their fancy. The management has arranged such special features as fancy riding and races on home trainers to maintain the interest of the spectators and several interesting exhibits of cycle curios and the like attract that portion of the visiting crowds which is not commercially inclined.

The L. A. W. and the C. R. C. both have booths and many of the local cycling clubs have thus far been present either in bodies or as groups of individual members. On the opening night ex-President Potter of the L. A. W. delivered a short address. Other speeches were made the same evening by local cycling lights and State Road Commissioner Budd of New Jersey gave a brief talk in the interest of good roads.

### PARTS FACTORIES BURNED

Dangler Plant Destroyed and Cleveland Machine Screw Co. Injured—Work Resumed.

Cleveland, March 27.—One of the fiercest fires ever experienced in Cleveland's manufacturing district destroyed the plant of the Dangler Stove & Manufacturing Company, on Perkins avenue, and damaged the stamping plant of the Cleveland Machine Screw Company, early last Friday morning. The fire spread rapidly from the testing room of the Dangler fac-

tory to all parts of the main building and the west wing and then jumped to the adjoining buildings occupied by the stamping department of the Cleveland Machine Screw Company. The Dangler company includes the well known Kells Manufacturing Company and the Kelly Handle Bar Company and nearly everything belonging to both concerns was destroyed or damaged. As soon as it was seen that the Dangler plant could not be saved, all efforts were directed to the stamping plant and the east wings of this factory were saved.

President Moore of the Cleveland Machine Screw Company, when seen by a Cycle Age representative, stated that his company's loss was about \$100,000, insured for more than double that amount. Said he: "The insurance adjusters will commence work in the morning and as soon as their investigations are completed we will be able to tell how we stand. The fire does not affect our automatic machinery and ball departments, as they are in an entirely different plant at some distance from the stamping department. Had the fire occurred some weeks ago a number of manufacturers who use our goods would have been seriously embarrassed, but we have made shipments earlier this season than ever before, so that only a few concerns will be delayed. We have already arranged to have the damaged building rebuilt and the work will be pushed to completion with as little delay as possible." An outside plant was at once secured and work was resumed this morning, Monday.

Mr. Dangler of the Kells and Kelly companies, stated that the saddle and stove departments had been completely cleaned out and the handle bar department badly damaged, but he thought it probable that they would be able to save the handle bar tools and dies. Their loss will probably reach \$350,000. The Kelly Handle Bar Company made arrangements the same day whereby it will be able to take care of all orders after this week, and began work in another factory today.

### IMPORTANT BANKRUPTCY DECISION

Entry of Judgment and Advertising Property For Sale Can Force Debtor Into Bankruptcy.

Buffalo, March 27.—A decision of importance to debtors and creditors throughout the United States was handed down by Referee Hotchkiss in Bankruptcy Court last week. It grew out of the proceedings in the matter of an alleged bankrupt. The gist of the opinion is that, whereas under the old bankruptcy law, if a judgment was entered against a failing debtor in favor of one creditor, the other creditors could not stop the creditor who had the judgment from proceeding and possibly getting the whole estate, short of proving intent or collusion, under the new law, the mere entry of a judgment and the advertising of the property for sale by the sheriff, without any intent or collusion, is sufficient to force the debtor, against whom the judgment is secured, into bankruptcy.

After stating the issue and the dates when the alleged bankrupt was insolvent, the ruling states, that on January 18, 1899, a judgment was entered and docketed in an action in the Supreme Court, in which Levi W. Rubenstein was plaintiff and Aaron Meyers was defendant; that on said judgment an execution was issued to the sheriff, who, on the same day, levied upon the stock of goods belonging to the judgment debtor and duly advertised the stock of goods for sale on January 26, 1899, and posted notice of such sale on January 18, 1899; that the judgment debtor, or any other person, did not, at least five days before the

date when the sale was advertised to take place, vacate or discharge said judgment or attempt to do so. On motion of the creditors, after the levy and before the sale, the sheriff was restrained by the District Court from selling under his execution, but was later permitted to sell as the representative of all parties on notice to the creditors of the alleged bankrupt, and the money realized from the sale, some \$1,200, was deposited to await the final decision of this controversy.

After an exhaustive review of the law and many interesting comments on the history of bankruptcy legislation, both here and abroad, the ruling concludes:

"It would be ridiculous to hold that creditors wishing to avail themselves of this act of bankruptcy must wait until a sale has taken place before filing their petition and in many cases would amount to a denial of justice. The bankruptcy act is a remedial statute and should be construed liberally to effect the purposes of its enactment. The phrasing of the act is not so accurate as that of the Canadian or the English acts, but that the words 'before a sale' must mean in a case like this the same as 'before the time fixed for a sale,' seems to follow from the general scope of the act and the uselessness of the third act of bankruptcy unless an interpretation be given."

### Week's Exports from New York.

The exports of bicycles and bicycle materials from the port of New York for the week ending March 21 are recorded as follows:

	Bicycles.	Mtls.
France . . . . .	\$13,016	\$11,543
Argentine Republic . . . . .	14,176	675
Australia . . . . .	7,019	2,729

By This Stamp

You May  
Know  
Them

**W**HEN you see an attractive saddle you generally look for the name of the maker, and nearly every time you find that it bears one or another of the familiar stamps here shown.

A saddle to be satisfactory must have beauty, style, durability and correct shape. These attributes are absent unless the goods are manufactured by experienced workmen under the supervision of men who make a study and have a thorough knowledge of the business, and who have the capital and the facilities to put together the finest materials in the best manner known to the art.

The American Saddle Company makes saddles that *satisfy*.

The evidence of it lies in the fact that such an overwhelming majority of the riders buy them, ride them and believe in them.

It is safe to trust the judgment that is so nearly universal and be governed by it in laying in your stock.

Buy the products of the American Saddle Company and you will need few others.

Saddle Company**

American Trust Building

Cleveland, Ohio

## COMMERCE IN FOREIGN MARKETS

**PHILIPPINES AS A MARKET**

The Philippine islands are looked upon as a good field for the bicycle manufacturers to unload their old stock in. The bicycle of '96 production is as popular as that of '99. At present Hong Kong is the distributing center for the Philippine trade. The market wants a low-priced machine, one that will sell at about \$20 gold in America, wholesale. The high-grade American machines are now selling there for \$185, Mexican money, but where one of these is demanded there is a call for 100 of the cheaper grade.

Brakes, lamps and bells must be attached to the bicycle in the Philippines. The streets are crowded with jin rickshas and sedan chairs and darkness comes on suddenly.

In Hong Kong from 5 to 7 o'clock each night the streets are covered with bicycles. The Chinese are the most faithful riders, and are wholly indifferent to the make or the reputation of the wheel.

**DUTCH WHOLESALERS COMPLAIN**

It is generally supposed in Holland that American bicycles, when broken, cannot be repaired and that their owners must have parts made, as they cannot be replaced. It is advisable to eradicate this impression. Catalogues should be printed in French. Wholesale dealers in Holland complain bitterly against the habit of some American manufacturing concerns in sending catalogues which give the wholesale prices to small dealers supplied by these large wholesale houses. The manufacturer's catalogue is looked upon abroad as a document of a strictly confidential character, and it is considered a breach of good faith for a maker or a wholesale dealer to let a retail dealer become acquainted with its contents.

In this connection it is interesting to note that a protest has been made by the export association in Rotterdam against the custom of American exporting houses publishing papers in the interest of their trade and sending their publications to retail bicycle dealers who "do not buy more than a dozen machines a year, and who, by receiving these papers, get acquainted with all the large manufacturers and export houses in America." The burden of this complaint is that the market is spoiled for the large buyers.

**DOES IT PAY TO DAMAGE SAMPLES?**

One of the first questions asked by a commercial traveler going into South American countries is: "Can I damage my samples in such a way as to make them unsalable in the opinion of a custom house officer without having their sightliness lost?" If samples can be damaged and still be useful, then another question presents itself: "Is the sum to be saved in duties and bonding expenses more than equivalent to the loss incurred in damaging the samples?" In answer to both questions it may be said that if the samples would sell at \$500 and the total expense of paying duties in Brazil and Uruguay and bonding in Argentina would not exceed \$500, then it is useless to carry a damaged line unless such a collection could be made from damaged stock on hand. On the other hand, should the total amount of duties equal or almost equal the valuation of the samples, then carry a damaged line because of

the saving of time, money, trouble in appraising, custom house delays, etc.

Samples should be packed in crates or boxes not weighing over 150 pounds, nor containing 15 cubic feet of space. At all ports in South America, with the exception of Buenos Ayres, Argentina, passengers and their baggage are sent ashore in small boats, and weighty or cumbersome trunks are very liable to get bad usage and cause delays. Baggage of this nature is usually carried about town on men's shoulders, and portable packages invariably facilitate the delivery of samples. Then, again, but few hotels or buildings in South America have elevators. On the contrary, all baggage must be carried upstairs through narrow hallways and doors, which also causes the necessity of a limit to the width of trunks.

Do not have your own or firm's name attached to your baggage; it often leads to trouble. Use locks and not nails to seal packages. In custom house examinations the superficial work must be done as quickly as possible; there are no packing tools about when wanted, and nails offer no security from theft while trunks are being stored in the custom house. Have on each trunk a detachable plate of some sort suitable for directions in case you wish to forward your goods ahead consigned to an agent.

### TRADE IS JUST OPENING IN SIAM

The demand for bicycles has just begun in Bangkok owing to the king's trip to Europe, where he became familiarized with the use of the bicycle and as a result ordered several for himself and his establishment. Bangkok is about the only city in Siam, with the exception of one or two small places, where a bicycle can be ridden at all. There is no basis for determining how many might be sold should the people decide to use them. There are many obstacles to be met in the cycle business there—referring to the American production exclusively. A large majority of the manufacturers demand cash, not considering that it requires from three to four months to land the shipment there; firms in Europe allow ample time for delivery before expecting settlements. This discrepancy accounts for American business (not only in the cycle line) being so small. Another detriment is the excess freights from America compared with rates from European ports.

The white population in Bangkok is composed principally of Britishers, Germans, French and Danes, the majority of whom would have to be educated to appreciate the superiority of American machines. The greater number of cycles in use have come from England, while the sundries are purchased in Singapore. Bicycles retail at from \$55 to \$100 in United States gold. The demand is mostly for cheaper grades; there is, however, a limited demand for high grade machines. Cycles are sold by Indian shopkeepers, hardware dealers, grocers and dry goods merchants. Siamese, Chinese and English are the principal languages spoken. The business is done on thirty to ninety days' time after the arrival of the goods; the merchants can hardly be induced to pay cash.

All the merchants in Bangkok are Chinese, with the exception of three or four Europeans. Except in a few cases, it would be impossible to do business with

them direct unless someone was on the spot to guarantee payments of accounts. A merchant who may be good today is no good tomorrow. This statement fits the majority of merchants anxious to do business with American firms. The course pursued by all European and American firms up to the present has been to appoint representatives there on buying terms who sell to the local dealers. A certain machine made in Chicago is prime favorite in Bangkok. An American missionary has opened a store for the sale of another well known American machine and is the only exclusive bicycle dealer in Siam. The importers in Bangkok are Germans and discourage trade of any kind except with their own country. In particular do they discourage the use of American goods.

### GOOD FIELD IN THE TRANSVAAL

There is a great field in South Africa for the American manufacturer and exporter, there being many rich concerns there which send practically all their business to Great Britain and the Continent, a large share of which might be diverted to American channels if our exporters and manufacturers had only the same confidence in the African dealer that they have in those at home. The dealer in South Africa has an equal amount of honesty and undoubtedly more means at his command, the question of remoteness being the only thing against him.

The question has been asked, "Why does the foreign dealer give the preference to European manufacturers?" This may be answered very simply with another question, "Why does the American manufacturer or jobber exact from the foreign customer a settlement of account for goods purchased, long before the goods are received and frequently before the goods have ever been shipped, when the European manufacturer is willing to extend a credit for at least thirty days?"

Again, the English and German manufacturers canvass for trade through the medium of clever commercial travelers, who visit the dealer personally, and none of whom carries more than five or six different lines. Above all, they are thoroughly acquainted with every line they carry. Contrast this with our American manufacturer. He makes a contract with an export commission house and sends the house a line of expensive samples, besides inserting a costly advertisement in the columns of its monthly or weekly export journal. What is the result? The commission house has on hand from seventy-five to 150 different lines of goods, not 5 per cent. of which it knows anything about.

### GREEKS DON'T LIKE OUR BICYCLES

In Athens, Greece, the sale of bicycles has fallen off greatly of late. The condition of the main roads is good. There are no domestic manufacturers of bicycles. Machines are imported from Germany and Austria. Some American machines were imported, but were of inferior make and dealers dropped them. The receiving port is Piraeus, five miles from Athens. There are no port charges. There are bonded warehouses.

If you wish to exchange hay, corn-stalks, corn, oats or wood for a boy's new pneumatic bicycle, call at this office and investigate.—Kingsville (O.) Forum.

# Prompt Shipments

Mr. Dealer—One of the reasons why the manufacturer can't fill your orders promptly is that he can't get the handle bars—if you didn't specify the Claus.

Every time you make a customer wait you give him a chance to change his mind—to buy another wheel.

If your customer didn't specify the Claus he didn't know anything about it.

Show him how it works—tell him it's guaranteed forever.

Tell him he needn't wait so long for his wheel if he takes the Claus.

Tell him if he isn't satisfied with the Claus after he gives it a trial he can exchange it.

We will back you up in all these promises.

We are up with orders and the manufacturer will equip the Claus if you say so.

## DIRECTION OF DRIVE THRUST ALWAYS UPWARDLY INCLINED

The Wind as a Factor—Error in Previous Article Corrected—No Argument for Low Frames.

To the Editor:—"Many men, many minds," and "minds differ as men differ." Much of our best judgment is founded upon a composite of the differing opinions of others. In your issues of March 9 and 16 you published two views taken upon the question of design in bicycle wheels with special reference to the ability of the wheel to surmount obstacles lying in its path. Two views were expressed and sustained by arguments, but there is more to be said upon the subject than yet brought out, and here we have still another argument from a different standpoint.

The principal friction which the wheel has to contend with is the roughness of the surface of the path along which it rolls, although this may not be the principal resistance overcome by the rider. Traveling at ordinary speed over smooth roads, the air resistance is as great and sometimes greater than the energy necessary to maintain progressive movement and overcome the machine friction and the rolling friction due to surface roughness combined. It may be considered as concentrated at the center of the vertical projection of the moving surface or probably not far from the pommel of the saddle, which is also the location of the center of gravity of the rider and wheel combined. This air resistance must be taken into consideration, and this will bring the line of thrust up so far that it will probably strike the ground some distance in front of the fore wheel.

To the mind of the writer, if the wheel is to be made to surmount obstacles more easily and with less violent vibrations, it will be accomplished by increasing the diameter of both wheels and adjusting the position of the rider in such a way as to more nearly distribute his weight, always letting the fore wheel bear the lesser weight, and retaining a low frame. With a larger wheel, in comparison with one of less diameter, the tire will come into contact with an obstacle sooner, will surmount it more slowly, and, although the rider may receive the same elevation thereby, the motion will be more in the nature of easy oscillation than of sharp vibration. As to just where this increase must stop when limited by appearance, ease in mounting, weight, cost of building, and other considerations, it is difficult to say, and any alterations which may be made in this direction will probably develop in the same way the bicycle itself has done—not as an engineering structure, but as an empiric design, one that has been developed by the rider and the mechanic. If the engineer has been consulted we would not today have 20-pound bicycles, and probably not so many repair shops, either; but that has nothing to do with the present question. W. K. L.  
Brooklyn, March 24.

In connection with the question of bicycle design to which this correspondent refers, the writer of the article which appeared March 16 feels bound to state to the readers of Cycle Age that an error in reasoning—besides that of overlooking the wind resistance to which the correspondent calls attention—slipped into that article. The error did not in any way weaken the refutation of Mr. Renouf's theory in favor of small rear wheels, but does weaken the assumption that bicycles with low-built frames will pass over inequalities in the road with smaller resistance than bicycles with high-built frames. It was stated that the thrust caused by the momentum of a bicycle would travel from the center of gravity of rider and mount combined—if the two were considered rigidly connected—toward the front wheel axle, and would therefore make the scaling of an obstacle in the road more difficult the higher the rider was perched.

### Momentum Operates Parallel to Ground.

Upon second thought the writer sees clearly that this was wrong. The momentum operates in the direction of travel and, when the machine and rider are approximately rigid, the direction of the thrust is transmitted to the front wheel at the axle in a line parallel with

the road surface. The other force which determines the impact with an obstacle travels, as shown in the previous article, from point of ground contact of rear wheel to front wheel axle and the resultant of the two forces must always be a line slanting upwardly to the front. Wind resistance which is always smaller than the driving power further increases this angle.

The well-known fact that a car-track is scaled with less of a jolt when the speed is increasing than when the rider allows the machine to slack up and pass over it by the momentum, may find its explanation in the greater upward angle of the thrust when a great surplus of power is being applied from the rear wheel tire.

### Road Inequalities Determine Wheel Size.

The best size of front wheels for either smooth or rough roads must apparently be determined according to the average size of inequalities in the road surface. There is evidently no gain in having the average line of thrust representing the force with which the bicycle is driven at any given moment, rise to the front wheel axle at an angle greater than the small angle between the wheel base and a line drawn from the point of ground contact of the front wheel to a point near the top of the obstacle to be scaled. The same reasoning applies of course to any roughness of the road which does not take the shape of distinct obstacles in the path of travel. Ruts, holes, cobblestones, etc., are all to be considered as obstacles, and it seems as if it must be very difficult to decide in favor of any certain size of wheel as being better adapted than any other to scale them and at the same time produce good results on smooth roads.

### More Millions for Automobiles.

Articles of incorporation of the Columbia Automobile Company, with a capital of \$3,000,000, have been filed. The company is authorized to manufacture and operate vehicles propelled by electricity, compressed air and other power. The incorporators are Elliott Mason, Andrew H. Scoble, John M. Scoble, Louis R. Moore, Anthony N. Jesbera, Sherman N. Granger, Francis R. Foraker, Roland B. Harvey, of New York; W. B. Greely, of New Rochelle, N. Y., and E. S. C. Young, of Jersey City. Mr. Mason is the manager of the Pope company's New York branch.

Articles of incorporation have also been filed for the New England Electric Vehicle and Transportation Company, with a capital of \$25,000,000. The company is authorized to manufacture appliances for operating vehicles and to manufacture and operate vehicles themselves. The incorporators are: James E. Hayes, Camden, and Arthur Phillips and Augustus Treadwell, Jr., of New York.

### Labor-Saving Plan a Success.

The success of the Cycle Age's catalogue department has been instantaneous. The manufacturers replied with alacrity to the invitation to forward the necessary literature and, since the announcement of the plan in last week's issue, there has been a steady demand from agents. Those readers who are not already familiar with the details will find particulars on the Cycle Age's page. It is designed to save the agent the trouble of writing a number of letters for catalogues when one will do.

The police department of Mayence, Germany, has adopted a regulation compelling all motocyclists to pass an examination upon their efficiency as automobile operators before being allowed to drive machines through the streets of the city.

## STANDARD CHAINS FOR MOTORS

### FRENCH TOURING CLUB RULES

To Facilitate Repairs and Exchange of Driving Chains Certain Standard Dimensions Are Recommended.

A commission of engineers appointed by the Automobile Touring Club of France has recommended certain standard dimensions for sprocket chains to be used on motor vehicles, with a view to securing interchangeability. The measurements are given according to the metrical system and it has evidently been one of the aims of the commission to devise a system which would help to exclude English and American chains in which the English inch is the basis of measurements and by the same stroke place an obstacle in the way of importing English or American motor vehicles unless their makers conform to the established standards.

In selecting the standard sizes it has been the object of the commission to place as few restrictions upon the freedom of the designer of motor vehicles as possible and to make every allowance for the varying requirements that depend upon the power and weight of various types of vehicles.

To enable owners of vehicles to immediately and without uncertainty replace a broken chain with a new one has been the main consideration.

The features which have been regulated are therefore only: Pitch, interior width between sideplates and the length of blocks or rollers. In chains with single roller blocks the last dimension is equal to the diameter of the roller. In those with double rollers it is considered to be the diameter of the two rollers plus the play between them. The play has been fixed at two millimeters.

It has not been considered necessary to provide for more than one width of chain for each variation in pitch.

### Dimensions of Single Roller Chains.

The table agreed upon for single roller chains is as follows:

Pitch.	Width.	Roller.
25 mm.....	13 mm.....	11 mm
30 mm.....	15 mm.....	13 mm
35 mm.....	20 mm.....	16 mm
40 mm.....	20 mm.....	18 mm
50 mm.....	25 mm.....	22 mm
60 mm.....	30 mm.....	27 mm
75 mm.....	35 mm.....	33 mm

For block chains or double roller chains the dimensions are as follows:

### Block and Double Roller Chains.

Pitch.	Width.	Blocks.
35 mm.....	20 mm.....	24 mm
40 mm.....	20 mm.....	28 mm
45 mm.....	20 mm.....	32 mm
50 mm.....	20 mm.....	36 mm
60 mm.....	25 mm.....	42 mm
70 mm.....	30 mm.....	48 mm
85 mm.....	35 mm.....	60 mm
100 mm.....	40 mm.....	70 mm

For the dimensions exceeding 70 millimeters pitch the commission found no precedent to work upon in the French motor vehicle industry.

### First Italian Motor Vehicle Shown.

The motor vehicle exhibition and road contest at Verona, Italy, held March 1, was well attended. There were thirteen competitors in the prize competition for vehicles of one seat, won by the Conte wagon of French build. Non competitors entered for the prize for the best vehicle with more than one seat, and this prize was won by Giusi, an Italian builder. The 100-mile road race was the first motor vehicle race run in Italy. There were nineteen starters, while eighteen contestants entered the race for motor bicycles and tricycles. The first race was won by Aquilli in 5:03:23 and the other by Ruggati in 4:05:02.

**T**HE rider of a National is always proud of his machine.

It's handsome and well made.

Like a good horse well groomed it adds to its owner's pleasure in simply being "all right."

The real satisfaction in the purchase of a National comes when the buyer finds that his first expenditure is his last. No repair charges or delays later to reduce his cash or spoil his pleasure.

One season on a National and he says—

*A National Rider Never Changes His Mount.*

Better join the procession.

# THE PASTIME AND SPORT

## DISSENTION IN C. W. A. FOLD

Many Matters to Be Decided at Friday's Annual Meeting—Official Organ the Bugbear.

Montreal, March 27.—The annual meeting of the Canadian Wheelmen's Association, which occurs on Good Friday in Toronto, will probably be a notable one. The affairs of the association have drifted along indifferently for some time and a crisis is at hand. The rock upon which the organization has split is the official organ, The Canadian Wheelman, which for many years has been the subject of much acrimonious discussion. Hal B. Donly, the secretary-treasurer of the C. W. A., tried for several years to publish the Wheelman on a basis that gave him a tremendous amount of work for an inadequate remuneration. Last year the publication of the journal passed into the hands of a joint stock company of cyclists, who have found that there is no money in its publication. On Good Friday the C. W. A. will have to face the fact that the Wheelman company will abandon its present arrangement with the association, and it is certain that no one will step in with any offer which will mean the supplying of a paper such as the Wheelman for less than fifty or sixty cents per member. Yet it is considered by every one familiar with C. W. A. history and affairs that the association membership cannot be kept together without a paper.

### Compulsory Membership Disliked.

Again, a number of large city clubs that have club houses, and to which C. W. A. affiliation is only an incident, feel strongly against the compulsory clause that every member of a club in affiliation must be enrolled as a member of the C. W. A. On this ground the association will this year lose some of its oldest and largest clubs unless a change is brought about, and a few clubs in this city talk strongly of dropping out of the association in any event.

Most serious of all is the fact that the present income of the association falls short of its needs. Outside the few unattached riders, the members pay in over the cost of their Wheelman, 26 cents each, and with this sum it is certain the association work cannot be carried on with sufficient effectiveness to command the support of cyclists in any considerable numbers.

### Plan for Two Departments.

In the meantime Secretary-Treasurer Donly has formulated the following plan and will move for its adoption at the annual meeting: "That the Canadian Wheelmen's Association shall be divided into two departments, to be called respectively the "Sporting Department" and the "Touring Department." Membership in the sporting department shall be confined to amateur bicycle and athletic clubs, which shall pay an affiliation fee of 10 cents per member for clubs under 100, 7½ cents per member for clubs of 100 and under 200, and 5 cents per member for clubs of 200 and over. The department shall control the government of the cycle racing and cycle racers to be licensed, all race meetings to pay sanction fees.

The touring department would issue individual membership certificates which would carry subscriptions to the official

gazette, customs privileges, legal protection, C. W. A. hotel rates, the new road guide, a share in the association's good roads work.

The fee for this would be \$1 per annum, with, perhaps, a small reduction to clubs sending in a number of names. The touring department would be open to unattached wheelmen and members of affiliated clubs. In the annual meetings affiliated clubs would vote their entire membership on questions pertaining to the sporting department and in the touring department one vote for each full privileged member.

### No Contest Over Presidency.

There will be no contest for the presidency, Louis Rubenstein, of Montreal, the present vice-president, having been the only candidate nominated. There will be a hot contest between A. B. Rattray, of Montreal, and J. W. Prescott, of Vancouver, B. C., for the vice-presidency, with the odds largely in favor of Prescott.

There seems to be a foregone conclusion that the city of Guelph will be awarded the Provincial meet to be held on July 1 next—Dominion day. Guelph has one of the finest tracks in the Dominion and a grand stand capable of seating more than 6,000 persons.

### New German Racing Union.

A meeting of track owners was held recently in Berlin at which it was decided to dissolve the German united racing societies and the German track owners' association and to form in its stead the "Union of German Tracks," of which Franz Langenscheidt was elected president. The following race courses were represented: Halensee track of Berlin and the tracks at Bremen, Breslau, Geissen, Hamburg, Einbeck, Leipsic, Mayence, Oldenburg, Neubrandenburg and Weisenfeld. The managers of the tracks of Cologne, Hanover, Darmstadt and Mannheim had written in advance that they would abide by all resolutions adopted. The riders' syndicate was represented by one member.

Resolutions were adopted fixing the membership fees of small tracks at \$2.50 annually, middle sized track at \$5 and large tracks at \$7.50; providing for the publication of a weekly official bulletin; making it obligatory for professional and amateur riders to pay annual licenses before being allowed to ride on affiliated tracks; and agreeing not to pay riders any more appearance money, allowing them only their actual traveling expenses and the prizes won.

### To Promote Outlaw Races in Chicago.

It is the avowed intention of John West to vigorously oppose the L. A. W. racing interests in Chicago. The trainer will be manager of a cycle track to be centrally located in one of the densest residence districts of the city. This will be an N. C. A. track and three Grand circuit dates in addition to a monster meet July 4 will be applied for. Mr. West will establish a training colony for amateurs and will charge the riders nothing for superintending their training. They will have to pay for the rubbers. The training quarters at the track will be the most complete in this country.

The municipal council of Marselles has voted \$500 for the creation of an annual "great prize of Marselles" race meet.

## WILL CANADA RECOGNIZE N. C. A.

Insistence That Johnson-McLeod Match be Run on Montreal Track Points That Way.

Tom Eck blew into Chicago last week and stimulated local interest in racing matters. Incidentally he showed a letter which has much weight on the attitude of the Canadian Wheelmen's Association toward the National Cycling Association. This was a communication from Manager Danderand of the Montreal track regarding the match race between Johnson and McLeod, the Canadian champion, in which the track manager insisted that the race be run on the Montreal track. As Johnson is known by Mr. Danderand to be an "outlaw," the letter can have but one meaning, and that was made plain when Tom Eck said: "The International championships will shortly be declared open to the N. C. A. riders of the United States, you mark my word. When they asked for the Johnson-McLeod match at the International meet they knew that it would mean the throwing down of the bars and the formation of an alliance with the N. C. A. by the C. W. A.

### Want American Stars at International Meet.

"Those people up there are giving their races for the big men and do not count upon a very strong representation of the foreign cracks. They want to see the American sprinters ride and may even decide to give the races for the Americans anyway and allow the foreigners to race if they wish to break away from the I. C. A. Why, when McLeod leaves the C. W. A. control to enter that of the N. C. A. at a time when his own country is to promote such important contests, he must have reasons for believing that the N. C. A. will be recognized, for McLeod, next to our own leading riders, is the most wanted rider at Montreal. When they demand this match race at any price they realize what it means and it is my private opinion that within the next thirty days we shall learn that both the Montreal and Charles River Park tracks have declared for the National Cycling Association."

### Martin Writes of African Tracks.

"Plugger Bill" Martin, writing from Durban, Natal, states that after his defeat of Van Heerden, the South African champion, at Cape Town, he rode at Graff Reinets, where he was beaten owing to the puncturing of his tire in the race. Continuing, he writes:

"I won at Grahamstown, also at King Williamstown, but was beaten at East London, where I got two bad falls. We were given a reception and dinner here by the Amateur club and got the same at Greenstown, where I was the winner. I have had a splendid time and have been well received everywhere. There are very few professionals in this country. There is a pretty ground at Cape Town and a nice three-lap cement track. The stand is a good one and the only one in South Africa. The others are mostly bleachers. The Cape Town track is about the only good one, according to the American standard. The rest are not unlike that famous death trap at Mahanoy City, where we all met our just deserts for riding on such a track. Yet I am riding on as bad here and doing well enough. But then, look where I am. These tracks are

Martin says nothing of having paid his fine to return to L. A. W. protection, although the letter was written after it was reported he had done so.

#### Plans for Chicago Six-Day Race.

The proposed Chicago six-day race is now scheduled for the second week in May. John West, who is promoting the affair, will clear the track for half an hour at the end of every six hours, forcing the men to rest for two hours out of every twenty-four. There will be two half-hour resting spells, and one of a full hour during the evening, when sprint races will be put on to fill in. The Tattersalls building will be the scene of the race. A ten-lap track will be constructed and everything possible done to help the riders break the San Francisco record. The entry list will include most of the riders from San Francisco, excepting Gimm and Fredericks, and others from New York and Chicago. The Illinois law against continuous racing will be evaded through a flaw in construction of the wording. Lawyers have passed upon the law and say that it will never hold water. The mayor and city police, however, assert that the law will be enforced as it stands, but this does not seem to frighten in the slightest the promoters, who are liberally backed and whose offer of a purse is generous in the extreme.

#### Six-Day Race at Houston.

The professional riders who have been following Jack Prince's Texas circuit are now riding in a two-hour-a-day six-day race at Houston. Prince is managing the race, which is creating no little local enthusiasm. The leaders are Bob Miller, Walthour, Repine and the Kreamers. Several local riders are also competing. The race was started March 21 and ends next Sunday afternoon.

The Lords Cycle Club of Houston kept the Sabbath, March 19, by holding a race meet at the Coliseum track. The races were competed by local amateur riders. The programme included nine events ranging from one-quarter mile to five miles.

#### Seattle Cyclists Help Themselves.

There are more than twenty miles of exclusive bicycle paths in Seattle at the present time, which will be largely increased in 1899. The cost of these paths was about \$6,100, which was raised by voluntary donations and a license fee of one dollar per year on each bicycle, 80 percent of which went to the path fund. Bicycles have increased from 300 in 1896 to nearly 4,000 at the present time. Cycling is an all-the-year-round recreation in Seattle.

#### Prince's Riders at Galveston.

Bicycle races under the management of Jack Prince were held at Galveston, Tex., March 19. The events included a number of races for local riders and two open professional races. The ten-mile professional was a paced event and was won by Bob Walthour in 23:38, with Miller second and Repine third. Bob Miller won the half-mile in 1:08 1-5, Walthour taking second and George Kreamer third place.

The irrepressible John Chinaman is making himself obnoxious as a cyclist in Shanghai. He evidently fancies himself a trick-rider, and is anxious to show off his dexterity regardless of the safety of the general public.

## RACING SITUATION SUMMED UP STRENGTH OF OPPOSING SIDES

Unless Union Riders Weaken the Fight  
Must Be Decided by the Race  
Track Owners.

Discussion is inopportune now as to whether it would not have been better policy for the L. A. W., in view of the troubles the racing game has brought the organization as a whole the past year, to have quietly dropped it at Providence with some such minute on Secretary Bassett's books as this: "Racing had no part in the objects of the L. A. W. as mapped out by its founders, who had only the furtherance of good roads and wheelmen's rights as the goal to be striven for by this union of bicycle riders. The control of racing, a function utterly foreign to the original intent, was assumed out of pure philanthropy to a fatherless sport. The child has proved ungrateful and unruly and has brought only trouble to our once happy family, diverting our attention from the real objects of the League and prejudicing it in the minds of many members and people who would otherwise be staunch and useful friends to it and its legitimate ends. Race control having become a nuisance and ceased to be even an advertising benefit to the League, it is hereby dropped."

#### What Might Have Been.

Probably the League's thankless and unlucky connection with it would soon have been forgotten. Perhaps its racing-made enemies would soon again have become valuable friends. Cycling columns devoted to condemnation of L. A. W. racing domination might soon have been replaced by helpful sermons for good roads and other practical and useful objects of League endeavor and there might have been no need of a national press committee to force such literature into newspaper columns which would be already filled with it through the voluntary contributions of their own writers.

The die, however, was cast at Providence when a majority of the delegates decided that the L. A. W. should endeavor to continue its control, and the fight is on. The outcome of the battle, for which the L. A. W. and the N. C. A. have locked horns, is the absorbing feature of discussion now in the cycle racing world, not only in this country but the world over. The international championships are to be run at Montreal the coming season and there has been, is, and will be to a greater extent than ever before an interchange of visits among the champions of all countries, so cosmopolitan has cycle racing become. Of course there can be no real claim of advantage on either side until there has come the "show down" of meets actually promoted and the relative participation of the racing men therein. Until then there can be but a comparison of organizations and a setting forth of little more than mere claims and promises.

#### The Two Sides of the Matter.

A comparison of these rival claimants for racing control is even now interesting and the claims and promises of each are worthy of critical consideration by the followers of the game, be they promoters, racing men or spectators. The L. A. W. seeks to govern on the ground that it always has governed and so has a title through long possession. Its theory is that the best interests of the sport demand that it should be controlled by those not financially interested in it and it needs the backing of a disinterested organization of great numerical strength and undoubted reputation with the gen-

eral public. The N. C. A. sets up as its *raison d'être* first and foremost a charge of gross mismanagement of racing by the L. A. W., either through the ignorance or wrong motives of officials accused of having been appointed largely as rivals for political services or as a punishment to political opponents. In opposition to this alleged mismanagement by appointees alleged to be purely political it sets up what it regards as the business-like proposition that racing should be governed by those directly interested in it, either as track owners, individual promoters, race promoting clubs or racing men.

#### Relative Strength of Opponents.

Now, what of the prospects? The L. A. W. has behind it the prestige of a great body, the experience and machinery of long and exclusive control, and the loyalty of thousands of racing amateurs and members—a no mean advantage. It is a very natural outcome of the wish that is father of the thought that the L. A. W. should claim that all tracks and bodies that have not sought membership or declared allegiance to the N. C. A. are to be counted upon as still loyal to the L. A. W. It may be that they are, but it must be remembered that owners of tracks and promoters of races may be very prudently waiting to see which way the cat is going to jump before naming the side of the fence on which they will be found the coming season. It is said that Chairman Gerlach claims a larger number of applications for National circuit and other sanctions than ever before. On the other hand, the opposition sets up definite claims by which a conclusion by exclusion can be arrived at.

#### N. C. A. Strongest in New York City.

The nucleus of the N. C. A. and its greatest strength lie in the membership of the American Racing Cyclists' Union, embracing all the leading professionals in the country save one, Major Taylor. It is in the metropolitan district that the N. C. A. shows its greatest strength so far as the undisputed allegiance of tracks, amateur clubs and riders goes. All the four tracks—Manhattan Beach, Berkeley Oval, Ambrose Park and Vailsburg—are numbered among the organizers and members of the N. C. A. and all are backed up by ample capital and stand ready to furnish purses and prizes sufficient in number and value to maintain high class professional and amateur racing in the district throughout the season. Most of the amateur riders in and around New York have already ridden under N. C. A. colors and the majority of the amateur racing clubs were represented at a meeting to frame the amateur rule. The new track at Washington and the cycledrome at Baltimore are also members. So is the track at St. Louis. Affiliation with the California and Southern racing associations has been effected. Walt W. Wilson, the member of the board of control of District B (New York and New Jersey), is a stockholder in and has exclusive control of the only track at Buffalo. The Inter-State Fair track at Trenton, on which one of the greatest meets of the year is given, was the first to break away from the L. A. W. and wring from Chairman Mott mitigation of the fines of the outlaws and pay them itself with notice of suit for recovery. Richard Kelsey, the former New England handicapper, is in charge there now for the N. C. A. and gives assurance of the allegiance of the New Haven, Hartford, Bridgeport, Waterbury and other New England tracks. The Fountain Ferry track management at Louisville has notified the "outlaws" that they need not go to Cape Girardeau to train. This leaves Chicago, Philadelphia and Boston as the fighting ground. The L. A. W.

claims all three and the N. C. A. prefers to say nothing as to them in the absence of definite promises and uncompleted negotiations.

#### All Depends on Riders.

But after all the key of the situation lies in the hands of the best professional riders. If they continue in allegiance with the N. C. A., the new body will control the cream of the big racing events. If the new body fails to put up the promised purses or shows inability to hold promoters to their promises, former alleged wrongs at the hands of the L. A. W. will soon be forgotten.

The racing union in the United States leaves the Canadians in an embarrassing predicament in their promotion of the international championships at Montreal next August. As a member of the I. C. A. the C. W. A. owes its allegiance to the L. A. W., a fellow-member. An international meet, however, is a business proposition and so expensive a one that racing attractions and gate receipts must of necessity cut a much larger figure than mere sentimental loyalty. The C. W. A. officials are reported to believe that they can run a successful championship meet without the presence of the American cracks. The track owners, who have to bear the larger part of the financial burden, are said to fear otherwise. Their fear is far from groundless. A championship meet on this side of the water with the American cracks absent would furnish very little sentimental inducement for foreign top-notchers to come over. It is hard enough to get them here even by paying their expenses and offering them big purses. It is doubtful whether the public in the absence of the Yankees would give sufficient support to pay the monetary inducements that would have to be offered. Such a situation is much to be regretted and unless the L. A. W. proves an out-and-out winner long before then there seems to be only one way out of it without abandoning the meet altogether and that is for the I. C. A. to elect the N. C. A. to exclusive membership as representing this country or to a joint membership with the L. A. W. if the constitution permits. But the N. C. A. might demand the former and refuse the latter. The complete victory of the L. A. W. and the exclusive recognition of the N. C. A. seem, therefore, to be the horns of the Canadian dilemma.

#### Trade Men Encourage Path Project.

Washington, March 27.—The local end of the project to build a cycle path between Washington and Baltimore took definite shape Friday evening in the formation of the Washington Cycle Path Association, which will co-operate with similar associations in Baltimore and in the several cities along the proposed route in the building of a forty-mile path. Permanent officers were elected for the ensuing year. A delegation from the Baltimore association was present and took an active part in the proceedings. The local association starts out with a large membership and with generous encouragement of the project. The Business Men's Association and the Washington Board of Trade have promised to lend their aid. The proposed path will be of great benefit to the cycle trade. Every movement calculated to improve the condition of the roads tends to increase the use of the bicycle, and with this idea in view the trade will get in line and give substantial encouragement to the enterprise.

#### Death of Frank Pearson.

Frank Pearson, the speedy Chicago amateur rider, accidentally shot and killed himself while hunting near his suburban

home at River Forest, March 23. His six-year-old son was with him at the time and it was through the child that the accident first became known. Pearson was one of the organizers of the Bankers' Cycling Club and at one time was its president. He was well known in local cycling circles, held the Illinois mile record and was regarded as one of the fastest amateurs in the city.

#### Suspended Riders Win in France.

A big meeting was run at Nice, France, March 12, in which Jacquelin and Deschamps, who had been disqualified for one month the week before, competed against Verheyen, the German, and many others. Jacquelin won most of the events, capturing the 2,000-meter scratch race from Verheyen by twelve lengths, and winning the pursuit race with Deschamps after going eight laps.

#### NEWS IN BRIEF.

L. A. W. press agents have announced that the League officials have restored to good standing under L. A. W. colors outlaws McDuffee, Nat Butler and Waller.

A bill has been introduced into the New York legislature providing that a cyclist who rides no faster than six miles an hour shall not be required to carry a lighted lantern, or if he is riding faster, he may escape the penalty by ringing his bell at every 30 feet.

Tom Eck is again anxious to match J. S. Johnson against running horses and has accordingly issued a general challenge through the daily press. The challenge is for mile races in heats and provides that Johnson be given the first eight feet around the pole and be allowed such pacing as is deemed best.

W. J. Stafford, the Bostonian, who set out on January 1 to out-Edward Edwards by riding one century per day during the year, has abandoned his task. He has completed thirty odd centuries, when grip caught him. He fought it for several days, but was forced to surrender after his fortieth hundred.

Miller's latest decision on future plans is to go to France. He has cabled to Paris that he is ready for an engagement of several weeks on foreign tracks and that he will sail some time in April so that he can ride in the Roubaix event in May. He also expects to enter twenty-four-hour paced races while in France.

The Wisconsin bicycle baggage bill is not receiving a very hearty welcome from the state representatives now at Madison, it having been tabled several times. Chief Consul Van Valkenburgh has been doing all in his power to get the bill through the legislature, but does not express himself as very confident of success.

J. S. Johnson has finished skating now and will soon begin training for cycle racing, at what track has not been determined. It may be Cincinnati, as Johnson expects to race there against Harry Gibson at a middle distance, probably fifteen miles. Johnson has shown improvement of form this winter and his skating has prepared him for a hard season on the path.

Floyd McFarland has decided to accept the challenge of Harry Elkes and will ride the latter a match at any distance provided the purse is large enough to insure the winner \$1,000 after the pacemakers have been paid. McFarland has also received a challenge from McDuffee which he will treat in exactly the same manner as that of Elkes. In no case will he consent to a division of the purse.

The touring board of the League of South Australian Wheelmen has arranged a monster camp to be held in a seaside locality during Easter time. The encampment is for the benefit of that faction of the League whose interests are not concentrated on the track. All of the cycling clubs in the League have been requested to send delegations and the proposed plan of laying out the camp is to set aside a large tent for each club.

The report had been spread by an overzealous press agent of the L. A. W. that Fountain Ferry track would be closed to the outlaws, but when questioned on the subject, Tony Landenwich, manager, replied: "They can train on Fountain Ferry track as much as they like." Consequently Bald, Cooper, Kiser, McFarland, Stevens, Kimble, Gardiner, Fisher, Johnson, McLeod, Elkes,

Ziegler, Gibson, Downing, Cotter, Munroe and others of the band of "outlaws" will be found at their work early in April. It is probable that about the middle of May the entire party will move to Berkeley Oval, there to take up their work again until they leave New York city on the state circuit, which starts at Ambrose park May 20, has a meet at Newark May 21 and at Berkeley Oval May 30.

Large purses will be common at the great circuit meets the coming season, track owners having reached the decision that nothing else will draw the best riders and attract large gates. It is promised that no less than seven meets during the opening weeks of the season will have handicap races for \$1,000 purses. One of the first races announced with a grand prize for first is the \$500 handicap which opens the season at Manhattan Beach.

The wheelmen of Cincinnati have petitioned the Board of City Affairs to abolish the present system of sprinkling asphalt streets. The cyclists claim that in addition to being a nuisance to cyclists, the heavy sprinkling is very injurious to the asphalt. The board received the petition favorably and turned the matter over to the street cleaning committee, which will doubtless experiment on one street at least by cleaning the asphalt without sprinkling.

Bald, who arrived in Buffalo from the Pacific coast last Saturday, said to the Cycle Age correspondent: "I will stay in Buffalo for a week and will then go to Fountain Ferry track, where I will get into condition. You can state positively that I will race in Europe this year, and will start for the foreign lands about the middle of May. I will do some racing here prior to leaving, so as to fit myself to meet our cousins across the sea. I have assurances of good support in Europe, but will confine myself entirely to match races."

Edouard Taylore, the French middle distance cyclist, will return to the United States next spring. He has done no racing since his arrival in Europe, an attack of malaria having laid him up since he reached home. He is now recuperating in England, where, unlike other foreign racing men who have returned from a visit to this country, he is painting glowing pictures of the money to be made here and the good treatment he received while in the United States, laying special stress on the fact that he received every cent he earned or won while here.

McDuffee will follow the action of Charles River Park track, where he expects to be stationed this season. Should the track management remain loyal to the L. A. W., then McDuffee will be the first white man to pay his fine and return to the L. A. W. Tom Linton will race under the L. A. W. when he comes, and it is also rumored that Edouard Taylore will do the same, he having applied for reinstatement in France. McDuffee has asked that his fine be remitted, or at least be reduced, and believes that this will be done to get him to return to the fold. He is in Boston now.

Tom Eck has gone to Hot Springs, Mo., with John S. Johnson, Angus McLeod and Ben Munroe. The latter is from Memphis and is looked upon by Eck as a coming man. Munroe is a stocky little fellow, but nervous and full of life. In build he is not unlike Stillman G. Whittaker, according to Eck. Last fall Munroe made a name for himself when he defeated Bald in a heat of the five-mile national championship at St. Louis. He was not given the decision, but competent judges said that victory was rightfully his. Munroe shot along from the rear and fairly out-sprinted Bald. He will follow the New York state and Grand circuits of the N. C. A. During the past winter Eck had him in the north on skates, a new experience for a Memphis boy, and the white-haired veteran says that his charge has developed most remarkably and is in prime condition to do wonders this season in the fastest company.

That Toga and Woodside Park will remain loyal to the League is practically assured. As to Willow Grove, it is hardly probable that the A. R. C. U. can guarantee a sufficient number of meets there during the year to warrant the managers of that record-breaking track destroying all chances of securing their shares of the local club meets by allowing races to be run there under any but League sanction, for every Philadelphia race-promoting club will stand by the League. A trolley line has just been laid to the gates of Point Breeze track, and it is hardly likely that the owners of the track will give up the first reasonable chance of making money. The A. R. C. U. cannot offer local track-owners one-quarter the number of money-making opportunities the League can give, and sentiment cuts no ice with the capitalists, whose object is the pursuit and capture of the nimble quarter-dollars of the race-going public.

## AWHEEL ON THE LEVEE

### Interesting Sights Along the Artificial Banks of the Mississippi in Flood Time

Cyclists who visit New Orleans hear a great deal about the crevasses of the Mississippi. The writer once made a 50-mile excursion a wheel to see one of these devastating breaks in the river's artificial banks. At the outset of the journey the ground traveled over was soil that had been reclaimed from the Father of Waters about eighty years ago and was moist and sandy alluvium, which effectually clogged the front forks, but the sun soon dried the upper crust of the road into a fine dust and made cycling a little more enjoyable.

The levee tops proved better, for they are used as foot paths by the country folk and are well trodden and smooth except in places which have been newly raised.

Occasionally a ride upon the levee was ventured in secluded spots and enjoyed until a guard ordered a halt or a gang of workmen, propping and strengthening weak places, compelled a return to the sandy stretch.

#### Scene At a Crevasse.

One of the illustrations on this page shows an interruption of the kind just mentioned. The workmen are busily engaged in strengthening the levee by the best means known to engineering science in the south. These breaks in the levee are, as is well known, exceedingly dangerous when they get beyond control. The roar of this crevasse was audible to the writer, on the special occasion when he undertook a visit to the scene, for the

of some other tree which had been torn down, and send the water splashing and roaring in every direction. It was a fascinating display of the marvelous force of a pent-up body of water turned suddenly loose.

#### State Road Appropriation Increased.

The New Jersey house of representatives passed Senator Johnson's bill increasing the annual appropriation for

should not become operative until an appropriation of \$1,000,000 for highway improvement had been made by the state. The amendments will, if passed by the legislature, remove this restrictive clause, and the bill will at once become operative. The Hamilton bill provides for a radical change in the system of road building and inspection throughout the entire state.

#### THE ROADS OF HONOLULU

Built on the Principles of McAdam and Topped with Lava—Are Practically Perfect.

Years of travel have made the streets and roadways in and around Honolulu almost as smooth as floors, and the highways of our new island possession are a credit to the whole nation; in truth, they can hardly be excelled anywhere, according to M. Vance Prather of Toledo, who

BRACING A WEAK LEVEE.

recently returned from the Hawaiian islands.

The process of road making in Honolulu is interesting, though it is now seldom carried on except in the outlying districts where new territory is being opened to traffic.

First of all, blue stone, which comes from the quarries in abundance, is broken to the size of walnuts and liberally spread over the thoroughfare from curb to curb. Then, with a ponderous machine propelled by steam, this is rolled until so smooth that save for the sloping from center to sides, a spirit level could hardly detect an unevenness. When reduced to a compact state, this foundation is covered with enough gravel to conceal it, and this, too, is rolled by the same weighty engine.

Finally, a reddish-brown coat of lava dust is spread over the surface and when rolled it is almost as hard as asphalt, and is pronounced to be far superior to it for practical worth and wearing qualities. There is much heavy traffic in Honolulu, and although showers are frequent, they do not seem to have any damaging effect on the roadways, which defy both traffic and weather and are only baked the harder by the sun's scorching glare.

It is due to this most excellent system of highways that the rubber tired equipment has found such popular favor and gained such a firm foothold in the island capital.

LEVEE FRONT AT JACKSON BARRACKS

distance of almost a mile. The engineers had given up all hopes of closing it and had done all they could by building a breastwork around each broken end, so that the water flowed through with all its force in the center of the opening and the remaining levee was protected from being further eaten away.

#### Fascination of the Waters.

The scene was appalling. The water was flowing through rapidly and its surface was smooth except when the trunk of a big tree would drift near and be sucked into the opening as though it were a straw, lodge for a while against the root

stone roads to \$150,000, on March 9. The governor, it is said, will sign the measure.

#### Making Good Roads Bill Operative.

The bill introduced into the state legislature by the highway improvement committee of the Pennsylvania division, L. A. W., amending (so as to make operative) the Hamilton road bill, which was passed at the last session, was favorably reported on March 2 from the committees of both houses to which it had been referred. This bill was pushed through the last legislature, but on its final reading was amended with a proviso that it

## RETAIL MISCELLANY

## General Information Concerning Cycle Agents and Repairmen Throughout the Country

## Alabama.

Henry Brown and George Houston have bought a controlling interest in the bicycle establishment of the Marvel City Cycle Co. of Bessemer and will continue business at the same stand. The first bicycle ever built in Bessemer has been placed on exhibition at their store.

## Arizona.

Gandolfo & Sanguinetti of Yuma have dissolved partnership. Bicycles were handled as a side line.

## California.

The San Diego Cycle & Arms Co. has on exhibition a mounted giant white pelican, weighing 42 pounds and measuring nearly 11 feet from tip to tip, which was killed in southern California.

## Canada.

M. J. Baker has opened a bicycle livery in the Grand Central hotel block, St. Thomas, Ont. The place is nicely fitted up and Mr. Baker has 55 new Brantford machines in stock, 20 of which are for hire. He also has a full line of sundries, tires, etc.

F. H. McLean of Winnipeg will open a bicycle livery in the Stobart block early in April. Mr. McLean will have about twenty Brantford machines on hand.

William Whittaker is arranging to open up his bicycle livery in Sarnia again for the coming season.

## Connecticut.

George H. Stevens is about to open a first-class bicycle store and repair shop in New Canaan. He states that he desires prices and discounts on bicycles and specialties from manufacturers.

A. D. Elster of Meriden has opened a new bicycle store at 123 Hanover street, where he intends to carry on business in the latest and most improved manner of repairing machines known to that profession. Mr. Elster is agent of the White bicycle.

## Illinois.

George S. Webb, who has for many years conducted a bicycle store and repair shop on "the island" at Aurora, has rented the same to Arthur King of Chicago, who will carry on the business. The store will be opened about April 1.

The building occupied by L. F. Hyneman as a bicycle store at Lexington has burned. The building was uninsured.

Hynes' bicycle store at Rock Island has been brightened and touched up in a manner that makes it more inviting than ever. A large assortment of models is being shown. The usual line of sundries will be handled and repairing will be looked after in a thorough manner.

Roy H. Jarrett & Co. have reopened their bicycle house at 721 Maine street, Quincy, and have on exhibition the best line of machines in the city.

George C. Heyde has bought out his brother's interest in the firm of Heyde & Bro., Marlon, and will continue the business in his own name.

Gibler Bros. of Harvey have dissolved partnership. They handled bicycles in connection with furniture, etc.

## Indiana.

Atz & Stuckey is the name of a new business firm in Decatur. They will carry a stock of harness, buggies and bicycles. Both men are hustlers in their line of business.

## Iowa.

The Cedar Rapids Cyclery, which was announced in these columns as having filed incorporation papers with the secretary of state in Des Moines, is located at 122 South Third street, Cedar Rapids. They are wholesale and retail dealers in Tribune, Deere, Eagle and Crawford bicycles and sundries. They repair, rent and store machines.

The bicycle store of Jackson Bros., Cedar Rapids, was entered by robbers and about \$75 in money and bicycle sundries and tools taken.

Stevens & Myers have bought out the business of Ira L. Thomas & Co., bicycles, musical instruments and sewing machines, in Oskaloosa. Increased capital and energy will be put into the business, making the establishment one of the foremost in its line in southern Iowa.

Clifford Feese will start a bicycle repair shop in Villisca next month. He will be

prepared to do good work, as he has had a great deal of experience in this line.

Korns & Faulks succeed Moses Korns in the hardware and bicycle business in Hartwick.

## Kansas.

Frank York of Salina intends to start his son in the bicycle business.

Lynch & Hart will succeed W. P. Lynch, a dealer in agricultural implements and bicycles in Wetmore.

## Kentucky.

The hardware store of G. Dreher & Son at Louisville has been damaged by fire. The loss will amount to about \$800.

## Louisiana.

Dalstrom Bros., bicycle dealers of Amite City, have opened a branch house in Roseland, where all kinds of bicycle work will be done. Cycle sundries of all descriptions will be on hand for sale.

## Maine.

Hall & Knight of Lewiston will open a bicycle shop and store on Lisbon street April 1.

## Massachusetts.

F. A. Hentz, formerly manager of the Boyleston Cycle Co., has joined the Boston forces of H. A. Lozier & Co. at their store at 396 Boylston street. Mr. Hentz is an old timer in the cycle trade. He was with the Pope Mfg. Co. for nearly a dozen years and later represented the Dayton Wheel Co. at Bar Harbor, Me.

W. J. Knowlton has rented a store on Main street, Palmer, and will engage in the bicycle business.

F. E. Wing, a bicycle dealer in Salem, has had wide experience in the bicycle business. In 1892 he had charge of the Ranny Cycle Co. of Akron, O., since which time he has been identified with the following firms: Hickory Wheel Co., John P. Lovell Arms Co., American Waltham Mfg. Co., Dame Stoddard & Kendall. He is now in business for himself at 74 Washington street.

Richard O'Brien has bought E. F. Dakin's bicycle repairing outfit and will open a repair shop in the old bicycle club rooms on Elm street, Southbridge. Mr. O'Brien will be assisted by E. D. Brown and for the present will conduct the business during the evenings.

E. D. Tufts of Palmer is making improvements in the arrangement of his bicycle store. His repair shop will be in the basement, his business office in the rear room on the ground floor, and the salesroom in front. A bookkeeper will be employed.

## Michigan.

Ed. Atyeo of Belleville has opened a bicycle store.

Some of the bicycle dealers of Kalamazoo have made complaint to the aldermen that a member of the fire department is conducting a bicycle agency on a small scale. They object on the ground that he is getting a regular salary from the city, besides being at no expense for store room for his machines, and say that it is hard enough for them to pay taxes and rent without such competition.

Hunter, Glenn & Hunter, a dry goods firm in Detroit, have dissolved partnership. They handled Iver Johnson and Erie bicycles.

Cyrus Reimer of Owosso has sold out. He handled hardware and bicycles.

Twogood & Bristol of Durand have sold their bicycle and general repair shop business to H. M. Cowley.

## Minnesota.

A. B. Fullerton of Livermore, Ia., an expert tinner and bicycle repairer, has accepted a position with F. B. Volz, Janesville, for the coming summer.

Wieland & Wade, the West Duluth merchants, have opened a bicycle store at 14 Lyceum building, where they will sell Crescent bicycles.

P. Martinson of Detroit City has put in a general bicycle repair shop and is ready for all kinds of work in that line.

Frank Goettsche has admitted F. W. Frank as a partner in his hardware and bicycle business at Sleepy Eye.

W. A. Sorg and H. H. Rutter of Winona have formed a partnership as the Gate City Plating & Cycle Co.

## Missouri.

Ostemeyer & Hill succeed Slack & Ostermeyer in business at Calhoun. Bicycles were handled as a side line.

## Nebraska.

F. C. Lyon has gone out of business at Wausa. Furniture and bicycles were the goods handled.

## New Jersey.

Walter H. Merritt has opened a bicycle repair shop at Middletown in connection with his wheelwright business.

The Quick Cycle Co. of Paterson is moving its repair shop to the Voorhies building on Washington street in order to allow more room for the display of bicycles in their store on Broadway.

The Ridgewood Cycle Co. has rented a store in Ridgewood and expect to open about April 1.

## New Mexico.

J. R. Hudson, a jeweler at Santa Fe, is dead. He dealt in bicycles.

## New York.

The business of Spencer, Lord & Co. of Dunkirk has been extended and they now sell bicycles both at wholesale and retail. Their business location has also been changed. The repair shop has been fitted up with all the conveniences necessary for the display and repairing of bicycles.

Alex. Smyth, formerly with the Erwin Mfg. Co., has gone into the bicycle building and repairing business at 74 Broadway, Rensselaer. He handles cycle supplies of all kinds.

Samuel M. Lawrence has sold out his hardware business at Cato. He had bicycles in stock.

Frank M. Mahan has opened a bicycle repair shop on Steuben street, Bath.

Glenn Curtiss' bicycle palace in Hammondsport is now nearly completed.

Strong Bros., Owego, are putting a new front on their store, which will enable them to make a better display of their bicycles.

C. H. Turner of Binghamton, at one time editor and one of the proprietors of the Herald, has purchased the bicycle business of H. E. Tiffany, 148 State street. Mr. Turner is now renovating and decorating the store and expects to open for business with a complete line of cycles and sundries about April 1.

Stephen Houk and J. E. Terwilliger will open a bicycle store at 83 North Avenue, Owego.

## North Dakota.

George D. Brown of Fargo is having the big store room of his bicycle house remodeled and thereby secures a much better display.

S. D. Bostwick of Bathgate has just purchased the repair shop outfit of Fiedler & Perrault and will enamel and repair machines on short notice.

## Ohio.

Grabler & Aslakson of Mansfield, who have been doing bicycle repair work in connection with the manufacture of plumbers' supplies, are preparing to locate in Cleveland, where they have purchased a brass foundry.

Mr. Eggerdinger of New London is fitting up a shop where he will sell bicycles, sundries, etc.

A quantity of rubber caught fire from a gasoline stove and ignited the interior walls of the bicycle repair room of Burgert & Banister's hardware store, Gallon. The damage was trifling.

## Oregon.

Dilly, "the fixer," of Corvallis, has enlarged his quarters and added a great quantity of bicycle supplies to his stock.

## Pennsylvania.

Richards & Nesmith, agents for Columbia bicycles at Warren, have rented the ground floor of the Y. M. C. A. building and will convert the same into a bicycle store.

M. D. Reynolds will occupy the addition to Warren Perry's building in Edinboro as a bicycle store.

Edward E. Hertzels has opened a bicycle repair and machine shop in the Mill building, Liberty street, Warren. The shop is well equipped for doing first-class work. In addition to repairing and light machinery work, a full and complete line of bicycle sundries will be kept on hand.

Alva Stewart has opened his bicycle shop in Ridley Park.

C. A. Conaughey has rented a business room in Ligonier and will run a bicycle repair shop the coming summer. He expects to have some fine high-grade bicycles for sale.

The Tivy Bicycle Mfg. Co. of Williamsport has just finished enlarging one of the best nickeling plants in the state. The company is well and favorably known, its machine has a famous reputation, and, together with the immense trade in repair work, is giving

the firm a leading place in the cycling business.

The Drake Cycle & Electric Co. of Huntingdon has disposed of its repair department to R. O. Johnson, a good mechanic, who has been in the employ of the company for two years. He is equipped to do all kinds of light mechanical work.

**South Dakota.**

The Dell Rapids Implement Co. of Dell Rapids will handle a fine line of bicycles in connection with its farm implement business. The company has engaged A. C. Anderson of Omaha, an expert bicycle maker and repairer, to take charge of the bicycle department, and will fit up a shop for him equipped with tools and extras for all kinds of repairing. Everything in the bicycle line will be supplied.

**Tennessee.**

The Biddle Cycle Co., Mabry street, Knoxville, has begun the manufacture of bicycles to supply the spring and summer demand. The firm desires to dispose of all its product to the retail trade direct. The company has agencies throughout the state as well as in other cities in other states.

**Utah.**

Bolitho & Lewis, hardware dealers in Richfield, have dissolved.

**Washington.**

O. R. Haight of Ritzville has sold out his harness and bicycle business.

**West Virginia.**

Harry Rogers has opened a bicycle repair shop in the Opera block, Bridgeport. He expects to handle all kinds of supplies.

**Wisconsin.**

E. T. Wiggins, foreman of the Warner cycle repair shops, had a close call. An emery wheel which he was operating burst while running at a high rate of speed. One piece of the wheel struck the floor between his feet and another the ceiling above him. He escaped uninjured.

The bicycle repair shop of C. F. Dunbar & Co. of Wausau has been opened. All work is warranted. S. T. Durant, who has been secured to do the work, comes very highly recommended as a first-class mechanic.

W. E. Miller, a practical, all-around bicycle man, has opened a bicycle store and repair shop at 54 North Franklin street, Janes-

ville. Mr. Miller will handle several grades of bicycles and a complete line of sundries.

Mr. Sorenson has placed an electric light plant in his bicycle factory at Ripon.

The Hoeffler Mfg. Co. has opened a bicycle store in the Atwell building, corner of Main street and Strongs avenue, Stevens Point.

Frank Trist of Racine has made preparations to do first-class enamelling and nickel plating and will make a specialty of renting bicycles.

**ROTARY CRANKS OR LEVERS**

**Reciprocating Levers Disagree With Rapidity of Foot Motion—Pronounced Antagonism.**

W. H. Bennett, Auburn, N. Y., has constructed the bicycle shown in the accompanying illustration and desires to sell

the patent. He states that he has a cable as large as a lead pencil, tested to stand 1,200 lbs. pressure without stretching and unaffected by moisture. It is made of fibrous material. The inventor has one bicycle built upon this plan in working order.

In reply to the inventor's inquiry in

regard to the commercial chances for the machine, the following may be said:

There has never been any great mechanical difficulties in constructing cable-operated bicycles on the plan shown in the photograph, except to obtain a cable with the necessary properties. Such a cable may be worth more separately than in connection with the mechanism—easier to introduce and sell.

Looked upon as a purely mechanical contrivance, it is generally admitted that a bicycle with lever propulsion instead of rotary cranks shows a higher efficiency per pound of pressure applied to the pedals, but the trade and the public stubbornly insist that the rotary motion is in better accord with the nature of man as a source of power. There is something in the complete stop of foot travel after each stroke which disagrees with man's physical nature. It might be different if a cyclist were always taxed to the utmost of his capacity for power exertion when cycling. But he is not. His capacity for rapidity of motion is what is taxed most heavily. For merchandise carriers and similar purposes the cable and lever system may be preferable, but hardly for a bicycle.

The cable system must ordinarily be supplemented by a brake, as it operates only one way. And to apply a brake on all occasions when the cyclist on a chain-driven bicycle would slow up by back-pedaling or merely allowing his feet to be dragged around by the pedals, is at best awkward, especially in large cities or where street traffic is congested.

**Woodruff & Little Bankrupt.**

George E. Woodruff and George L. Little, doing business as the Woodruff & Little Cycle Company, of Towanda, Pa., have filed petition in bankruptcy in the United States District Court. The liabilities are \$17,307, with no assets. Woodruff gives his liabilities as \$20,523 and no assets, and the liabilities of Little are \$11,480, with \$100 assets.

The landlady of a London hotel recently refused admission to the house to a lady cyclist clad in a rational costume. The Cyclists' Touring Club has taken the matter up and intends to prosecute the landlady.

**AN EXTRACT**

"Of all the bicycles made and sent from the Chicago market the greatest bargains are those offered by the Chicago Tube Co. Their 28-inch, 30-inch and 3-crown wheels with Fauber one-piece hangers beat them all. They are up to date in design and equipment and are exceedingly highly finished, and their agents control the market with them in their respective territories."

IN ADDITION to bicycles referred to in above extract from a letter by a prominent dealer we make and sell frame sets and frames and also all material to build or to repair or to equip a bicycle, and have, for the past six years, a constantly increasing business, and are in a position to give the best for the least money. Particulars, catalogue, etc., to any address.

**CHICAGO TUBE CO.**

217 East Washington St.,

CHICAGO, ILLS.

# INFORMATION FOR BUYERS

## NEW WRINKLES IN THOMPSON'S FITTINGS.

Some trouble was experienced last year with bicycles built with sheet metal fittings, owing to the unscientific formation of the lugs on the connections, which in pressing were stretched and made too weak at the junction of the lug with the shell. To guard against all possibility of such a fault in the widely known Thompson's fittings, the Geo. L. Thompson Mfg. Co., 6128 La Salle street, Chicago, has given especial study to this point, with the result that by the method of pressing now in use at this big plant every lug is in effect reinforced at these points to allow more than the usual margin of safety. The bracket shell, for instance, is of 13-gauge metal and in pressing the lugs outward this same thickness is retained at the point of juncture and does not diminish until the shoulder on the lug is approached. From that point the thickness decreases until at the end of the lug the gauge is only 17 or 18. By this method of production all danger of weakness in the lugs is obviated and a thoroughly strong, safe bracket provided.

The head lugs have been similarly strengthened and the angle of the shoulder, against which the tube end abuts, is not so abrupt as in some fittings of last year, consequently there is much less danger of disaster in manufacture than was the case with the old pattern joints. Instead of the usual right angle, the shoulder has a wide oblique angle and the tube end is belled to fit snugly against same, and at the same time to form a flange, which more readily conveys the spelter to the joint in brazing and is afterwards filed off. An internal ferrule is provided which is placed so as to lend strength to the joint at its weakest point, the shoulder. In this instance the ferrule is a piece of tube, fitted and pressed when the shoulder is made. In this way it forms prac-

tically a part of the lug, even before brazing is accomplished, and necessitates little or no attention in building.

The head is swaged down to fit inside each of the head connections and extends to the extreme end of each, reinforcing the lug where it starts from the head by the addition of brass gathered in brazing. Where dip brazing is in vogue, and Thompson fittings are used, care should be taken to punch holes in the ends of each lug so as to allow the free circulation of the spelter.

The Thompson company has equipped its plant for the manufacture of fittings for both flush and outside joints and the factory is now running full time. While the demand is for the flush connections in the majority of cases and the company has taken the greatest care to make them perfectly safe and accurate, it believes that the outside joints are superior.

The company has also provided fittings for thirty-inch wheels of the three-arch-crown pattern, although it is held that it is a fad which will soon go the way of others. There is a demand for the fittings, however, and the Thompson company has taken the greatest care to make them sufficiently strong to withstand the additional strains placed upon them by the enlarged design. No chances have been taken at all.

An expander has been placed before the trade in which some new ideas are incorporated so far as cycle construction is concerned. The seat post or handle bar stem is slotted on one side and a split steel ring inserted; this ring is about three-quarters of an inch in width and carries a bolt, the head of which is V-shaped on the side fitting into the slot in the ring. It carries a nut and washer on its outer end, the latter fitting against the face of the frame as shown

in the illustration. When the nut is tightened the V-shaped wedge is drawn into the slot in the ring, which expands against the inside of the seat post, forcing the latter against the inside of the frame tube. It is simple in construction and also in operation.

A comprehensive catalogue has been issued in which all the parts made by the company have been illustrated and described, and which will be mailed to any builder upon application. The factory is capable of supplying any demand that may arise. Although not so long in the trade as some others, the company points with pride to the immense business it has worked up as an evidence that it stands in good faith with the trade and gives good value for the purchaser's money.

## BUILDING ADDITION TO ORIENT PLANT.

Each year the increased demand for Orient bicycles has made it necessary to add to the facilities of the Waltham Mfg. Co. of Waltham, Mass. This year is no exception, as the company has within the last ten days been compelled to add a large wing to its already extensive works. Men are working night and day to complete this structure, which is greatly needed, as the factory is running twenty-four hours a day in many departments to keep up with the high tide of orders.

It will be recalled that it was this concern that took the initiative in establishing beyond the question of a doubt the speed efficiency of the chainless bicycle, for it was upon an Orient Sager chainless that last October, under most adverse circumstances, Major Taylor, assisted by the Orient pacing outfit, established the phenomenal record of 1:31 4-5 for the mile. This was only a crowning climax to the large number of world's records established during the preceding season, amounting to a total of 278; obtaining for the first time in the history of the bicycle on an American track the world's record for the hour. As a natural result of efforts directed in these channels, the Orient company today is reaping its reward. It is doubtful if in the history of the trade there is any better example of what can be accomplished by enterprise than is exemplified by the great demand for Orient bicycles.

## SUNBEAM SPOKE A PATENTED ARTICLE.

The American Specialty Mfg. Co. of Hartford, Conn., which originated and introduced the now popular "sunbeam" twisted spoke, states that this form of spoke is fully secured by United States letters patent 598,620, dated February 8, 1898. It has come to the knowledge of the company that the increasing use of the "sunbeam" spoke has invited imitation and that orders are now being solicited from the trade for a similar spoke of unlicensed manufacture. It is the purpose of the company to prosecute all infringers of its patent rights and it thereby cautions dealers, jobbers and users against any and all imitations of the original "sunbeam" spoke with view to saving them from future legal consequences of participating in infringements.

## NEW DEPARTURE IN NAMEPLATES.

One of the latest original patterns of nameplates turned out from the factory of S. D. Childs & Co. of Chicago is finished in royal blue and gold, the raised letters and scroll work being in burnished gold and the background being treated to a bluing process which is a new departure in the plating line. Another notable feature of this form of plate is the height to which the letters are raised above the sunken background. Even the smallest letters on the plate stand out in a bold relief which gives the plate a rich and substantial appearance that cannot fail to appeal to the eye favorably. The company has been in the nameplate business since the early days of the industry and has all along been a leader in the production of new patterns of plates and is recognized as originator of novel ideas in nameplate design and finishes.

## THE CRESCENT GAS LAMP.

The accompanying illustration shows the exterior appearance of the new Crescent acetylene gas lamp manufactured by Herman Boker & Co., 105 Duane street, New York city. The main features of the lamp are its simplicity, readily cleaned water valve and gas burner and even distribution of water to the carbide. At the lower extremity of the tube leading to the gas jet is a threaded opening closed with a knurled thumb screw. By removing this screw and turning off the water so that gas generation will cease, an ordinary tire pump may be screwed into the end of the tube and by

a few strokes of the pump the gas jet thoroughly cleaned out. The water feed tube being merely a straight tube inclosing an adjustable and removable needle, the cleaning of the feed becomes merely a matter of taking out the needle and thus allowing the unhindered downward flow of water to wash the impurities from the inside of the tube. The water tube is surrounded by a perforated tube in the carbide chamber which brings the water in contact with the carbide at several points at once and thus causes an even generation and flow of gas. The carbide cup is fitted with a false bottom so that consumed carbide can be re-

moved in a lump and without having to scrape out the inside of the cup. Any form of carbide may be used and the makers state that the lamp will burn six hours at one charging.

## IMPROVED GENTRY CHAINLESS GEAR.

Since the Reading Chainless Gear Co. of Reading, Pa., has obtained new and ample factory facilities to take the place of the original factory which burned down last year, much activity has been displayed in perfecting the Gentry chainless gear in order to get it upon the market in a satisfactory form both from a commercial and from a mechanical standpoint. As a result of the company's efforts the gear is now furnished to the trade as a complete set ready for building into a bicycle and is also offered the dealer as a regular driving equipment of all Vindex bicycles manufactured by the Reading Cycle Mfg. Co., also of Reading, Pa. The present mechanical design and construction of the Gentry gear shows much improvement over the original pattern and after rigid tests on more than seventy-five machines made and fitted with the present form of gear the makers feel confident in offering it as a reliable chainless gear possessing both easy running qualities and durability. The driving mechanism is in the form of a regular star sprocket and fits to the sprocket hub of the Crown hanger manufactured by the Reading Cycle Mfg. Co. The intermediate gear or idler runs on a ball race made in the form of a ring and attached to the bicycle frame by two blocks integral with the right rear fork, the rear support being on the inner side of the fork and the front support on the outer side. The gears and pinion are but five-sixteenths of an inch wide, so that the entire

mechanism when incased in the dust-proof sheet steel casing is narrow and does not add in the least to the tread of the cranks. The face of the casing is easily detached and replaced and the meshing adjustment of the gears is readily accomplished.

When the gears are sold in sets for building into bicycles, both front and rear hubs are included in the outfit as well as the gears proper, the hanger parts and bracket and the rear forks and fittings. The hubs supplied are of the Star disk adjusting pattern, made by the Reading Cycle Mfg. Co., and the gear parts will not be sold without

# CYCLE AGE

Vol. XXII. No. 22.

THE CYCLE AGE OFFICE.

March 30, 1899.

## Advertisers and Advertising.

There is a great deal of talk about advertising being something hard to understand.

Advertising is the least mysterious of all things.

There is no secret about advertising. It stands for itself.

There is more mystery about "no advertising." Once and a while a fellow can plug along, and make a small competence, and retire from business fairly well-to-do. The wonder is, "How did he do it?"

He is generally a man who keeps open from 5 o'clock in the morning until 11 at night, burns coal oil, does his own sweeping out, squeezes a penny as if it were his all, never enjoys himself socially, and is known in the community as an old moss-back, but—"he is honest, and does what he says."

But the man who advertises comes out in the broad daylight—with each issue of the paper. Everybody knows why he is making money—that he isn't afraid to tell what he has to sell, and what he sells it for—and they go to him with the confidence instilled by continued publicity; for no one could advertise to sell gold dollars for 50 cents and do it right along, because either the gold dollars would be counterfeit, or the man would bust up in business.

And did you ever notice that the advertiser has a bright, tidy store? That he is a public-spirited citizen? That he and his family enjoy themselves socially?

That's the reason that advertising is not mysterious.

It makes a man of a man. It makes him a power in a community.

Once in a while some men who advertise don't succeed. It is their fault, not advertising's fault.

One of these same men might get a bolt of seasonable cloth, and shove it back on a shelf until the edges got faded, and the goods musty and dusty, and it would be valueless.

Run your advertising as you do the rest of your business. It takes common sense to do either.

Do not buy up the sides of barns, and cover them with white and black paint; do not buy little tin signs to tack around; do not disfigure farmers' fences; do not go into fake schemes.

Use the newspapers.

Use the best—the one that goes to thousands of buyers each week, and is read by them.

That paper is the Cycle Age. It is at your service. Our advertising experience is at your service. Space we charge for; advice we give freely.

## Cycle Age Foreign Department.

The growing demand for American goods makes it desirable that someone be prepared to supply prompt replies to those questions which confront shippers.

The Cycle Age has organized a foreign department for the benefit of its advertising patrons.

It can furnish reliable information rela-

## The Cycle Age Catalogue Department.

Every agent may save the time and expense involved in writing a dozen letters for catalogues. The Cycle Age has on hand the catalogues of nearly all its advertisers. When you want one or more, write to the Cycle Age, giving a list of those you require and enclose postage. They will reach you by return mail. You will have saved yourself considerable time and trouble.

tive to the more remote as well as the more important countries.

Its investigation has extended to every country in the world.

It has on its lists over 17,000 agencies in foreign countries.

The advertiser who desires information concerning tariffs, port charges, ports, packing, freight rates, express rates, bonded warehouses, steamship lines, population language is invited to apply to The Cycle Age for particulars.

## Sticking to It.

Newspaper advertising is not an experiment in any sense of the word. It is a common sense, business transaction. Returns the first week or month are not always encouraging, but it is the sticking at it that brings success. No business was ever built up to be a success in one week or one month. Continuous advertising in the right mediums is the best and safest and surest road to business success.

Ask advertisers who use it whether the Cycle Age is one of the right mediums.

## What do you want?

Why don't you, like other wise men, tell the trade about it through The Cycle Age small ads. column. The charge is 5 cents a word for one insertion—3 cents a word for subsequent insertions. . . . Other people find it profitable.

## What have you to sell?

## Modern Cycle Repairs an Immediate Success.

Copies of the Cycle Age's repair book were mailed last week. Every mail since has brought some expression of appreciation from a satisfied purchaser. Here are a few samples:

We are more than satisfied with Modern Cycle Repairs and would recommend it to any one who is in the repair business. It is worth ten times the price.

F. DECREMER,  
Green Bay, Wis.

No mechanic ever gets too old or wise to learn. I have spent 14 years in the cycle business and am learning yet. Modern Cycle repairs is the best thing I have ever seen in this line.

HARVY R. GEER,  
ST. LOUIS ALUMINUM CASTING  
COMPANY.

Modern Cycle Repairs is the best work on the subject I have ever read. It is complete in every detail.

CHARLES HENDERSON,  
Vinton, Iowa.

Every repairman, every factory superintendent, every mechanic may find something of value in Modern Cycle Repairs.

Cycle Age subscribers pay \$1.00 for it; other people, \$2.00. The repair book and a 12 months' subscription to Cycle Age costs \$3.00.

them, as the gear company believes it is the best policy to see to it that as smoothly running hubs as any are used with the gear in order to prevent unfavorable opinions being formed on the running qualities of the gear because of poor wheel bearings. The materials used in the various parts have been selected after careful consideration with view to obtaining the best for the purposes in each case, and the workmanship has been closely watched so that the completed gears may be as mechanically perfect as possible. The gear of a bicycle fitted with this mechanism may be readily altered by changing the rear pinion, which can be done within reasonable limits without interfering with the rear portion of the gear cover. The gear is covered by broad patent claims granted to the inventor, O. H. Gentry. J. E. Blackman is general manager of the company.

#### MAKING JUVENILE CYCLES ONLY.

The Hero Cycle Co., Ontario and Wells streets, Chicago, is confining its efforts entirely to the production of juvenile bicycles this season. The manager of the company inclines to the belief that there is a good field for this variety of machines, and has concluded to leave the construction of adult bicycles to other manufacturers who are devoting their time to that class. So far this year 2,500 juvenile machines have been made by the Hero company and it is the ambition of the manager to make and sell 6,000.

The machines are not of the ordinary juvenile construction; they are made symmetrical and proportionate at all points. The usual child's machine has tube lengths shortened, but the diameters and connections are the same as those used in adults' machines. The product of the Hero factory has been made to take a high standard of excellence and is being taken up by the best trade throughout the country.

The latter day improvements are incorporated in the machines, such as internal expanders in handle bars and seat posts. The frames are supplied in different colors, with nickel plated crowns.

#### NEW BRUNSWICK CO.'S COMPLETE LINE.

The New Brunswick Rubber Co. of New Brunswick, N. J., is making a very full line of tires this year. It makes one high grade line, as follows: Fenway, corrugated; Meteor, smooth, and Messenger, rough. These tires carry the fullest guarantee.

It makes another tire—the Raritan—in the three different treads, which carries a 60-days' guarantee. This is a new tire just introduced, and is proving immensely popular.

Then it continues to make, as it has during the last two or three years, the popular Regal, which carries no guarantee but which is a good, serviceable tire. This is also made in three different styles of tread—corrugated, smooth and rough.

#### TIRE BELL ATTACHED TO REAR STAY.

The Frank Mossberg Co. of Providence, R. I., is calling the attention of the trade to the fact that the Mossberg tire-actuated bell may be applied to the rear as well as to the front part of a bicycle frame. Though the common practice is doubtless to place the bell on the front forks so that it may be operated by a cord running directly to

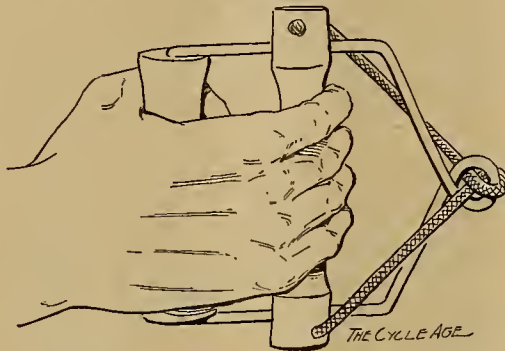

the handle bar, many riders now have their machines equipped with front wheel brakes, thus making it necessary to place the bell on the rear stays above the rear tire. No special fittings are required to attach the bell to the rear stays and the operation is exactly the same as when the bell is attached in front. A patent has just been granted covering the construction of the Mossberg bell and applying to both the single and double chime movements. One of the features of the bell which insures long

life to the working parts is the absence of springs, the return of the strikers being effected by the combined tendency of gravity and rebound.

#### LITTLE GIANT WRIST MACHINE.

Cycle dealers looking for profitable side lines which can be handled without a heavy outlay of capital will be interested in the Little Giant wrist machine, manufactured by the Little Giant Wrist Machine Co., 335 Decatur street, Brooklyn. The machine is designed to develop the muscles of the hand and of the forearm. The handles slide on the wire frame and are held apart by the tension of a double elastic cord. When the handles are gripped in the hand and alternately brought together and separated by closing and opening the hand, it will be

found no easy task for an untrained person to continue the work for more than twenty-five or thirty seconds. By timing one's self the person using the machine can notice daily improvement in the "grip" of his hand, for after constant practice he will be able to keep up the motion for a much longer time without tiring out. The wrist machine is said to be a good cure for such hand cramp as that with which typewriter and telegraph operators and accountants are often troubled.

#### HENLEY'S SKATE INTERESTS GROWING.

Since the revival of roller skating the Henley roller skate and bicycle factory at Richmond, Ind., has been taxed to the utmost to keep up with orders, and has been running day and night a large portion of the time. M. C. Henley, proprietor of the works, who is also interested in one of the largest and finest rinks in the country, located in Richmond, writes that the attendance at that rink throughout the entire season has been exceedingly large, the rink having two or three sessions almost every day excepting Sundays. Attractions of different kinds are offered at the rink, and at the mask carnival on roller skates, held at the rink a fortnight ago, there were more than 2,000 paid admissions. It attracted a large number of competitors and developed unbounded enthusiasm.

Mr. Henley also states that the outlook for the Henley bicycle works for the coming season is better than for years past. There are eleven models in the Henley line and indications are for a very active season's business in these popular goods.

#### STERLING PLAYING CARDS.

The well known bathing girl poster of the Sterling Cycle Works of Kenosha, Wis., now appears in a new role, the company having used the design as the decorative design on the reverse side of playing cards which it is sending broadcast over the country at a nominal price per pack. The cards are made by the U. S. Playing Card Co. and are of the maker's regular fifty-cent quality. They differ from many advertising playing cards because there is no fancy designing or advertising matter on the face, such matter being confined to the backs. This renders the cards suitable for card clubs and for the use of confirmed card players. The ace of spades and the joker have small advertisements on their faces, but this is common to all cards, the manufacturer usually placing his own advertisement on these cards. The poster design on the back is surrounded by an ornamental background in Sterling olive green.

#### TWO TUBE TESTS.

Some interesting comparative tests were recently made between two kinds of bicycle tubing, the tests not merely being comparative in the sense of comparing the different makes of tubing, but in that of comparing the results of tests made in different manner. The makers of the Clincher brazed tubing have been forwarding to those who are interested in the matter samples of their tubing brazed to seamless tubing. The two short pieces of tubing were in each instance brazed side by side so that the party to whom they were sent could place the two together in a vise, one jaw of the vise striking the Clincher tubing and the other jaw touching the seamless tube. In this way by tightening the vise gradually and

watching to see which tube flattened first, the comparative strength under compression of the two tubes could be determined. The result of this test when made from the samples sent out was that the seamless tubing flattened before the Clincher began to crush. From mere curiosity as to the reliability of the test, a piece of regular stock Clincher tubing was placed in a vise alongside of a piece of seamless tubing, the pieces being each one and one-eighth inch in diameter and 20 gauge in wall thickness. The Clincher tubing was crushed about half of its normal diameter before the seamless tubing began to give. The result was seemingly a demonstration of dishonesty on the part of the Clincher people with regard to the character of the stock used in the samples sent. Either the Clincher tubing used was of a better grade than that sent out in stock, or the seamless tubing was of an inferior make and not of the kind stated. However, the reputation of the Clincher makers being such that they could not well afford to stoop to such practices, another solution for the radical differences between the two tests was looked for and a third test made.

It is a well known fact that seamless tubing is often sent out from the mills in a hard-drawn condition. So it was reasonable to suppose that the seamless tubing used in the second test might have gained in stiffness over the Clincher because of it not having been annealed. Another piece was cut from the same bar of seamless tubing and, being found to be in the hard drawn condition, was annealed in a brazer flame, it being heated to about the average brazing heat and then allowed to cool slowly. This placed the seamless and the Clincher on the same basis as far as annealing was concerned, but, in order to make sure that the Clincher was annealed to the extent that it would be by being heated in a brazing flame, it, too, was placed in the flame and annealed in the same manner as the seamless. The two pieces were then placed in the vise side by side and the vise tightened. The seamless tubing smashed nearly flat before the Clincher began to crush. The result showed that when both were in the annealed condition, as either would be at points around the frame connections after having been built and brazed in a bicycle frame, the Clincher tubing was much more able to resist compression strains than was the seamless, thus carrying out the maker's original statement.

#### GROSS SECURES POPE'S MILWAUKEE AGENCY.

After maintaining a magnificent emporium in Milwaukee for a number of years, the Pope Mfg. Co. has made arrangements to place its Milwaukee agency for the entire line with the Philip Gross Hardware Co. Ira D. Lundy, well known to the trade for many years as the manager of the Cream City Cycle Company, has been secured to take charge of the cycle department.

#### ADJUSTS TO ANY POSITION

The Frederick adjustable handle bar manufactured by the Frederick Mfg. Co., 220 Broadway, New York city, may not only be adjusted within ordinary narrow limits, but is capable of being lowered to the deepest scorching position and of being raised to a position correspondingly high. The locking screw, being furnished with a hexagonal slotted head, may be turned with either a screw driver or a wrench, thus allowing the rider to change the adjustment of the bar with whichever tool he has at hand.

There being both a front and a back lug at the top of the stem, the appearance of the bar at the hinge is symmetrical and the head almost if not quite as strong as that of a rigid bar. The taper ratchet plug draws the hinge parts together with ample security and at the same time does not bind when the locking nut is released. The bars are sold both to manufacturers buying in large quantities and to dealers and repairers. The former may obtain them either black or finished. The bar tubes are 7-8 inch in diameter and the forged stems are furnished either 7-8 or 13-16 inch in diameter.

#### FAUBER HANGERS IN GROWING DEMAND.

Fauber hangers continue to be in ever increasing demand. The sales have already doubled those of last season. The factory is

# Fittings

Detroit,

Mich.

working 23 hours a day; 300 hands are now employed and as soon as the rush deliveries come the force will be increased to 400. Mr. Fauber estimates the output of hangers for this season at 300,000, this estimate being based on the orders already booked. There may be an increase over this, but he has stock on hand for this quantity and is pushing the production as rapidly as possible.

### IVER JOHNSON CYCLE REVOLVERS.

Cyclists desiring revolvers which furnish ready protection on the road against vicious dogs and tramps and which may be conveniently carried in the pocket have had their wants anticipated by Iver Johnson's Arms & Cycle Works of Fitchburg, Mass. The company is now making a small, reliable 32-calibre cycle revolver in both hammer and hammerless patterns. One of the desirable features of the weapon is that the operating mechanism is such that it cannot be discharged except by pulling the trigger.

### BUNDY LAMPS IN THE WEST.

The Frank E. Bundy Lamp Co. of Elmira, N. Y., has placed the Bundy acetylene lamp in the hands of H. W. Coolidge & Co., 135 Lake street, Chicago, for representation in northern Illinois, Wisconsin, Iowa and Minnesota. W. F. Coolidge of the latter firm is now on the road in the interests of the lamp, being at present in Minnesota, whence he reports an excellent business in his line.

### REMINGTON TRAVELERS RECALLED.

The orders received up to the present time for Remington bicycles are so much in excess of the early anticipations of the Remington Arms Co. of Ilion, N. Y., that the company has taken its entire traveling force from the road and is devoting all its energies toward filling promptly the orders now on the books.

There has been a change at the rubber tire factory of H. N. Wayne of Watertown, Mass., and the concern will hereafter be known as the Watertown Rubber Co. C. G. Macaula, representing them, is traveling New England.

H. M. Putnam, formerly connected with the Simonds Rolling Machine Co., and later with the Fitchburg Steel Ball Co., has accepted a position with Iver Johnson's Arms & Cycle Works of Fitchburg, Mass.

### J. P. THOMAS Revolving Hubs and Hangers

**DOUBLE BALL BEARINGS**  
with Inner Revolving  
Sleeve Increases the  
Speed 40 per cent with  
the Same Power.

Patented in U. S. Dec. 28, 1897.

These bearings have created such a demand that we find it necessary to increase our capacity. In nearly every instance where sample orders have been shipped we have received regular orders for stock. Large manufacturers and supply houses are figuring with us on quantities.

We are determined to reach all riders and dealers that have not yet tried the J. P. Thomas revolving hubs and hangers, and have therefore decided to offer a better discount from the list to manufacturers and dealers on any size orders from one set or more.

Oscar Holdberg, 3,000 Wentworth Ave., Chicago, rode a bicycle fitted with J. P. Thomas revolving hubs and hangers in a contest and won the three first prizes.

NOTICE these great points of interest: Travels 40 per cent faster with the same power; a dust proof cap prevents dust entering the bearings; oil feeder, needs oiling but once in a season; no cleaning or repairing the entire riding season; lasts twice as long as the ordinary bearings; we guarantee what we claim or money refunded; we have no traveling salesman. Furnish dealers with all advertising matters. Write for terms and catalogue.

Pat. in U. S. Dec. 28, 1897

## ACCOUNTANTS HARD AT WORK

### Factory Options Are All in—Guessing at Intentions Towards Parts and Equipment Makers.

For a week past expert accountants have been at work in the bicycle factories upon which options have been given to the syndicate of capitalists who wish to effect a consolidation. They have made their appearance simultaneously in several large centers of the industry and should have their work completed within three weeks. Mr. Spalding is of the opinion that all the options required are now in hand, although it is plain to outsiders who have a turn for investigation that there are many concerns of considerable importance which as yet have not been asked to sell.

#### The Jobbers Are Uneasy.

Much speculation is rife with respect to the part which the leading parts, material and equipment makers will play in the consolidation. The jobbers and the firms which make for them, too, are being discussed, and that these groups of the trade are not disposed to sit idly by and see their trade dissipated is evidenced in the following communication:

We most sincerely hope that some successful method can be devised that will cement firmly all deserving manufacturers, those who are making a good article and have their money invested in finely equipped plants. There are, comparatively speaking, very few who have plants equipped for the manufacture of bicycles, a great majority being simply assemblers; and these people have made it hard for the legitimate manufacturer to market his goods at a reasonable profit during the past three years.

If the part makers were bought up, and their plants locked up, we could do away with the competition from the assemblers. Our factory is fully equipped to enable us to manufacture bicycles without buying a dollar's worth of goods from the part houses, if necessary, and we would be very glad to do so if the part makers were to close down. This would make it necessary for the assemblers to either invest a large amount of money in machinery and tools to manufacture the parts for their machines, or retire from the business, and such competition would, of course, very naturally be shortened, and the legitimate manufacturers would be on an equal basis.

For the proposed bicycle combination to meet with success they will be obliged to include in the combination a great many undesirable concerns. If they do not do this they will find the capital of the jobbers pouring into these concerns, operating them at as lively a rate as ever, building machines for themselves. We ourselves have had two propositions from large buyers to take our plant off of our hands at a fair price, we to operate the plant solely in their interests. We are also familiar with the fact that this same proposition has been made to two other concerns, and as the jobbers in question have millions of dollars, they would be able to operate without any trouble twelve or fifteen plants, and prove warm competitors for the combination.

Kenosha, Wis. CHAS. H. SIEG MFG. CO.

#### Correcting False Impressions.

In order to correct false impressions the following bulletin has been issued from headquarters:

My attention has been called to certain misleading statements relative to the proposed bicycle alliance that have recently

appeared in the press in the way of special articles and alleged interviews with various men in the trade, and I am prompted to say that nearly all such articles and so-called interviews, so far as they relate to the future policy of the proposed combination, are entirely misleading and without authority or direction of those in a position to speak for the new company.

An interview with a gentleman prominently identified with the trade, to the effect that in towns where ten agents are now located the new company would get along with two, is entirely misleading, and the gentleman in question denies ever having given expression to such a thought. Other statements of a similar character are equally as misleading.

It is not the intention of the new company to crush anybody, but it is the hope that with such a combination many of the evils that now beset the bicycle trade can be diminished and an improved condition all around obtained. Knowing, as I do, the general intentions of those identified with this movement, I feel safe in assuring the bicycle trade generally that the policy this new company will adopt will tend to improve present conditions, be better for the manufacturers, better for the agents, better for the parts makers, better for the riders and, in fact, better for everybody identified with the trade.

Matters in connection with the alliance are progressing as rapidly and satisfactorily as could be expected, and just as soon as there is anything definite to announce the press will be fully informed, but in the meantime it will be well to make allowance for any misleading statements and so-called interviews that may appear.

A. G. SPALDING.

New York City, April 1.

#### Union Label on Sieg Product.

After a four-years' struggle with the trade unions, the Charles H. Sieg Manufacturing Company, of Kenosha, Wis., has just made an agreement with President Mulholland, of the Bicycle Workers Union, to place the union label on every bicycle sent out of the factory. This action on the part of the managers will put an end to all the differences between Mr. Sieg and his employees.

#### Sheriff's Sale of Rex Stock.

The sale of the stock of the Rex Cycle Company, at Seventy-second and Sherman streets, Chicago, was ordered last week by court to satisfy a judgment in favor of creditors of the concern. The entire stock, valued at \$3,000, was purchased at sheriff's sale Friday by Robert Thacker for \$1,405.

## TRADE ASSOCIATION BOOMING

### Good Feeling Prevails Among Minneapolis Tradesmen—Fewer Frames Cut Down.

Minneapolis, April 3.—Ninety-five per cent of the cycle dealers of this city have agreed to maintain the schedule of prices for repair work and rental rates recently adopted for the season of 1899. Those who have not agreed to it are unimportant and are located in the suburbs of the city. The Minneapolis Cycle Trade Association has been organized for about sixty days. Its meetings are well attended and much interest is taken in them. They are "free and easy," not too formal, and the best of feeling exists among the members. A bonus of \$25 is put up by each member as a guarantee to maintain prices. Dues are 50 cents per month. Meetings are held in the various places of business.

#### Want St. Paul Dealers to Come In.

Benchmen tried to form a union, but could not get together on it, seemingly, and the dealers took hold of it. An effort is being made to include St. Paul dealers in it also and the chances are good of doing so. The intention later on is to rent a hall and fix it up for meetings and as a general club room. Members signing the agreement number about sixty-five and more are coming in all the time. The benchmen are all inclined to think that it means better wages than in the past. Good all around men, able to do all kinds of lathè work, brazing, etc., are getting about \$3 per day; others from \$9 to \$12 and \$15 per week; boys to wipe off, \$2.50 and \$3 per week. Employment throughout the year is given to very few now. The majority are able to work only during the very busy season, probably six months in most cases.

#### Reduced Lists Affect Repair Work.

The disposition of dealers to employ men only for a short term has resulted in the springing up of repair shops all over the city. A number of shops have been busy all winter building machines to order for riders who want to select their own fittings, but there has not been so much of this kind of work as there was a year ago on account of the reduced prices of standard bicycles. Fewer frames have been cut down also on account of the reduction of lists, riders preferring to trade in their old machines for new machines. Many of the larger houses that carry bicycles as a side line have done away with their repair shops and made arrangements with some nearby shop to do their work on a fixed scale, say 20 per cent. below list. They think it will be a much more satisfactory way of doing. There is one concern that does nothing but repair tires, and it is doing well.

The commissioners of Fairmont Park, Philadelphia, have made a rule prohibiting the running of motor vehicles of any description within the park limits.

## BIG STORES IN NEW ROLE

### Chicago Department Houses Seek Repairing at Cut Prices —Venturing on Sale of Fittings

It is now the repairman's turn to endure with what equanimity he can the plaguing competition of the department store. This by no means implies that the bicycle dealer has known the last of such competition. On the contrary, it is his lot to be a powerless spectator of the

crippling of his co-worker, while at the same time his own business in sundries and cheap models is being undermined. The wings of the department store have been clipped, but its talons have not yet been drawn.

#### Fifty Per Cent Prices for Remodeling.

In no city of the Union does the department store fare better at the hands of the people than in Chicago, and naturally it is here that one looks for the early outcropping of that trade enmity which through custom is annually anticipated by the bicycle trade. One of the

HAVE YOUR WHEEL  
CUT DOWN AND REMODELED  
TO 99 STYLE \$4.85

big establishments, which from its earliest identification with the bicycle business, has played havoc with the Chicago retail trade, this year grapples with the repairman and placards its sporting goods department with announcements which show pretty plainly that it is the intention to fight to the last ditch rather than be edged out of the bicycle trade. Nickel plating work is solicited at prices which dismay repairmen. Glancing down the table of prices, it is observed that current charges have been cut almost 50 per cent, on the average. The offer to cut down and remodel bicycles for \$4.85 is another evidence of the bitterness with which this big store is waging war against its humble competitors, for the usual price for such work in Chicago is \$7, depending, of course, upon the nature and difficulty of the work. The enameling prices which are quoted in this store show a reduction of more than 50 per cent.

One of the largest department houses in the western metropolis is venturing

cautiously and quietly into the sale of fittings, and is offering a few eccentric hangers complete for \$5 and rear hangers for tandems at \$7.50. A special hanger with gold plated sprocket wheel and cranks was marked \$12. Only one sample of each was displayed, and it is not known how large a stock is in reserve. They are this year's production of one of the largest and most reputable parts making concerns in the country and it is exceedingly improbable that the hangers were purchased direct from the makers.

#### Thirty-Inchers at Cut Prices.

Taking advantage of the fact that there is considerable talk about 30-inch wheel models, the department stores are quoting such patterns at \$29.75, guaranteeing them for one year, giving any options which the purchaser may desire, and certifying, in the language of one of the eclectic salesmen of these establishments, that the connections are made of "malleable steel." As a matter of fact, these machines look well, though to the practiced eye there is roughness in finish upon close examination. Not all of the

department stores in Chicago are handling 30-inch wheel machines. There is as much diversity of opinion concerning the demand for them and as much rivalry in running them down among such establishments as is displayed in antagonizing the movement in favor of the use of chainless models. There is but one big store in Chicago where any serious pretense is made to sell bicycles of a reliable brand, and in this house this virtue is offset by the slaughter prices which are quoted on sundries. The most diligent search does not disclose a single

pattern of high grade or high price. In this respect the department store trade of Chicago is in marked contrast to the policy which reigned in such establishments at this time a year ago.

It will not be the fault of the Chicago department stores if acetylene gas lamps are not in wide use this year, for there are few houses in which capable demonstrators are not at work all day long, explaining the method of generating gas, regulating water flow, cleaning tips, etc.

#### Fire Fights Fire.

A few days ago one of the large stores announced a sale of bicycles at such a low price that a competing store was

thrown into a paroxysm of jealousy, the ill effects of which did not disappear until it had advertised machines at \$4.98. The details of this "special cash sale" are displayed in this page. The aggressors had advertised machines at \$9.98 complete. The concern which advertised machines at \$4.98 complete had the best of the competition until it was discovered that employes of the rival store had purchased twenty out of the twenty-five machines for sale and that the machines were again on sale in the store of their employers at \$9.98.

Naturally the trade is curious to know something about the appearance of these machines. A glance at the group of mechanical drawings will eloquently express the method of construction employed in the important visible parts. The ordinary cheap machine of modern manufacture is as superior to the models offered for sale as Hyperion is to Satyr. They were constructed of old-fashioned parts which had evidently been resurrected from the scrap heap. They were equipped with ancient saddles and handle bars, but they were guaranteed for a year—by word of mouth.

## SPECIAL CASH SALE

TO SHOW THE PUBLIC WE ARE IN THE BICYCLE BUSINESS.

At 10 o'clock Monday we will sell 50 high-grade BICYCLES, at....

**\$4.98**

NO MORE—  
NO LESS.

We have the best values on earth at \$9.75, \$12.98, \$13.25, \$15.48, \$17.48, \$19.95, \$20.48, \$23.48 and \$27.50.

**WILL BEGIN WITH A SCRAMBLE****PUBLIC IS FEVERISH TO BUY**

**Brisk Sales May Create a Brief Shortage in Assembled Stock—Trade Awaiting Good Weather.**

Cleveland, April 3.—With a foot of snow on the ground, the bicycle business is almost at a standstill here in all its branches. The material makers have filled nearly all of the first orders for supplies and are now anxiously trying to induce the bicycle makers to furnish more specifications or to allow them to ship goods already completed. Most of the bicycle makers have shipped the first stocks to the dealers and still have a fair number of completed machines on hand; hence they are not inclined to receive more supplies until they are assured of a steady demand for more machines. All of the local dealers have a good supply of bicycles in the warehouses, but it will take only a few days of pleasant weather to dispose of these, and then there will be a grand rush. A prominent maker of parts who has recently visited all of the factories in this section states that the cold weather has put a decided damper on the energy of the bicycle manufacturers and that the prospects are there will be a decided shortage of machines when the season has fairly opened.

**Hustling While They Wait.**

Despite the cold weather there are plenty of visitors and some buyers at the retail stores. Nearly every store in town reports a sale or two every day and the long-headed dealers are making especial efforts to induce prospective buyers to allow them to set aside machines in order that they may have them in readiness, fully equipped to suit their wishes, in time for the first day of open weather. One enterprising concern is succeeding in corraling a number of early orders by the pass-book savings bank scheme. The prospective buyer is given a book in which are entered amounts paid in, and when the rider has paid one-third the price of the machine, he is allowed to take it, giving a mortgage for the balance. Another agent has been very successful in inducing riders to visit his store "early and often" by a guessing contest as to the plurality which will be received by the successful candidate for mayor at the coming election. The scheme not only brings riders into the store, but after the contest is over the dealer will have the names and addresses of several thousand wheelmen which he proposes to thoroughly circularize.

**Good Call for Second-Hand Stock.**

While the majority of the early sales are in the better grades of machines, there seems to be an unusually strong demand for good second-hand bicycles, especially of the drop-frame variety. The demand for ladies' second-hand machines is so pronounced that the old stocks have all been sold, and as very little trading has yet been done, the shortage will continue until warmer weather.

Local dealers are at a loss what move to make regarding the sale of sundries, and several of the prominent concerns have decided to carry only enough stock to fill immediate demands and to confine themselves only to the most popular lines. Last year the dealers were induced by very low prices to patronize a leading department store which had gone into the sundry jobbing business on quite an extensive scale. By purchasing in large quantities this concern was enabled to secure rock bottom prices and it offered very attractive figures. But, no sooner had the retailers laid in large stocks than the "enterprising" department store cut

its retail prices, offering its goods at practically jobbing prices, which of course did not tend to improve the business of the retailers. This year the concern in question is attempting to carry out much the same tactics. Hence the dealers have decided to go slow on sundries.

**PASS-BOOK PLAN SUCCEEDS**

**Many Early Sales Made in Buffalo Through Advance Installment Scheme—Will Try Renting.**

Buffalo, April 3.—Five hundred bicycles were sold by one local branch store, it is claimed, through the passbook system between January and March 1, when the offer closed. Of this number not more than fifteen took advantage of the agreement whereby the money paid in could be drawn out if for any reason the depositor desired to do so.

Renting will be made a regular branch of the retail business here by most of the reputable stores this season. Up to last year the Buffalo dealers, with one or two exceptions, made no effort to cater to this remunerative branch of the business, but the revenue derived by those dealers who conducted such a department last season was so gratifying that it led to the determination on the part of the majority of the trade to operate a fully equipped livery department this season. The livery business, it is believed, not only affords a neat income but also acts as a good stimulus to sales.

Second-hand bicycles will be largely used for renting, but only such stock as is in the best of condition will be put into service. "It was a noticeable fact last year," said one dealer who did renting last season, "that that portion of the public which hired bicycles did not want nor would it ride any but a good looking mount, and as was frequently the case a buyer would often be found among those people by simply paying a little attention to their wants." Those of the trade who have not already accumulated a stock for this purpose will recruit up to the desired equipment through the "trading-in" plan.

Of the machines rented out last year a theft seldom occurred, and as a rule the machine was returned in as good condition as when it was sent out. Tandems were in great demand last year, and as there were not more than half a dozen available, reservations were frequently made a week in advance.

**Gotham's Spring Show a Success.**

New York City, April 3.—The dealers' cycle show, which came to an end last Saturday, proved a decided success in point of public attendance. The management made money and the exhibitors were satisfied. It is the intention to repeat this show next year, when it is expected the number of exhibitors will be three times as large as on the recent occasion.

**Enameling Machines for 75 Cents.**

From present indications there promises to be a good sized rate war this season among bicycle dealers and repairers in Winona, Minn. As the result of an announcement by one establishment to enamel bicycles for \$1 each, the dealers' association now offers to do the same work for 75 cents. Prospects are excellent for a cut in other lines.

During the last nine months of 1898 the number of bicycles imported into Switzerland rose to 2,146, of a value of \$642,940. Such high figures have never been reached before. The exports of cycles has also made a jump, the fifty-seven factories exporting to the value of \$17,800.

**SUNDRIES IN THE ANTIPODES****GAS LAMPS BECOMING POPULAR**

**English Tire Repair Outfits Expensive—Thumb Operated Brake—Growth of Home Building.**

Sydney, March 10.—The acetylene lamp is becoming popular in Australia. Bennett & Wood, Limited, of Sydney, sold 100 in January. The lamp they push is the Phenomenon, made in England, and the price charged for it is \$3.60. The weight when fully charged is 22 ounces. Other acetylene lamps have been given exhaustive trials, but considerable trouble has been experienced with them owing to the burners getting clogged with the soot generated by the gas. In the Phenomenon a purifier has been introduced in the shape of a small bag of carbon through which the gas passes. The reservoir is a little larger than usual. When fully charged it will burn for from four to five hours.

**No American Repair Kits.**

If a person calls at a cycle agency and purchases a "repair outfit" he is always supplied with one of English manufacture. How is this? Are there no American repair outfits on the Australian market? The price charged by the agents for a repair outfit is exorbitant. They are never sold for less than 24 cents. And what are they composed of? Simply a small tin box, enclosed in which is a very small tube of solution, a small box of chalk, a small piece of sandpaper, a few small pieces of rubber, about two inches of canvas and three or four valve rubbers. And this is what riders are asked to pay 24 cents for.

The lamp brackets fitted to some American machines are really a disgrace. They are too weak and some of them bend under the mere weight of a heavy lamp. Such unimportant and inexpensive attachments as the lamp bracket are nevertheless taken into account by purchasers. The American manufacturer should fit a solid lamp bracket. The Australian roads are not smooth, and when a machine is ridden at a good pace over rough roads it soon "plays up" with a weak bracket when a lamp weighing 1½ pounds is attached to it.

**Growth of Local Industry.**

It is remarkable how the local manufacturers have sprung up in Australia, more especially Victoria, where there are hundreds of them and the number is daily increasing. The majority build their machines from English parts and all seem to get a good living. They never build a wheel for less than \$60 and some charge more than \$110. There are also many firms springing up for the manufacture of tires, all of which are made on the double tube, Dunlop principle. One firm lists its tire, the Reliance, at \$12, a big cut under the Dunlop price.

Machines with wood rims do not find such a ready sale as the steel rimmed bicycles. The Westwood (steel) rim is in almost universal use. Ninety-nine purchasers out of a hundred specify Westwood rims for their mounts.

**Thumb Operated Australian Brake.**

The most popular brake on the market is what is known as the "thumb brake." It is fitted in the ordinary way to the fork crown, but instead of being made so that it is used from the handle grip it terminates at the head of the machine. The rider puts his hands on the middle of the handle bars close to the head and sets the brake with his two thumbs. The brake is exactly the same as the ordinary one in all other respects. It is just as effective as other lever brakes or even more so.

# THE BEST SELLING WHEEL

Nobody wants a poor wheel at any price, but thousands are looking for a high-grade wheel at a low figure. . . . There has never been anything fancy about CRESCENT prices, but the wheel itself has proven more than fancy painted it. The record, the quality and the price keep Crescents spinning.

COPYRIGHT 1898 BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.  
PRESENTING TESTIMONIALS.

JOHN A. DADD & SON, Druggists and Pharmacists  
221 GRAND AVENUE  
MILWAUKEE, WIS., June 9, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen: Replying to your favor of 6th inst., would say that the Milwaukee Patent Puncture-Proof Tire is O. K. I have ridden them since the beginning of the season. They ride easily and I have proven their puncture-proof qualities. Enclosed please find a tack which I found driven into the tire its full length, and it must have been in the tire some time, as you will see upon examination, as the head is ground off on one side. Yet on pulling this out I found no leakage and rode 25 miles that morning and have used it ever since without trouble of any kind. I am perfectly satisfied that they fill a long-felt want.  
Sincerely yours,  
(Signed) ROBERT M. DADD.

JOHN I. JENNINGS  
With Chicago Lumbering Company  
MANISTIQUE, MICH., November 21, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen: Having ridden a wheel fitted with your Puncture-Proof Tires the past season, I can recommend them to be what you claim for them—a strictly puncture-proof tire.  
Yours respectfully,  
(Signed) JOHN I. JENNINGS.

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## REPAIR PRICE SCHEDULES

On another page there is presented a list of the repair prices prevailing in various towns in Illinois and Michigan. The towns vary in size from two millions to three hundred inhabitants. The smallest are Algonquin, Princeville, Atlanta and Fairfield in Illinois and Dayton, Central Lake, Paw-Paw, Alma and Mason in Michigan. The rest are of sufficient size to be supposed to afford all necessary facilities for economical bicycle repairing and sufficient patronage for developing the skill of repairmen.

In looking over the list it is at once apparent that great irregularities in prices prevail; that the same piece of work is estimated as being worth very much more in one town than in another. In several instances towns in which greatly varying prices are charged, are so close together on the map that it must happen frequently that cyclists from one of the towns visit the other town and have occasion to become acquainted with the variation in charges.

The moral effect of this condition is, of course, to prime the public thoroughly with the idea that all repair prices are arbitrary and extravagant and thereby bring about a general suspiciousness which ultimately forces prices all over to the lowest notch. When that point has been reached, as in Chicago, the ambition to do good work, on the part of the repairman, must gradually vanish and give way to a desire to do as little as is absolutely required for obtaining the depressed price which the customer grudgingly pays.

If a somewhat uniform scale of prices could be adhered to the downward tendency which has already gone too far, might perhaps be arrested and a higher standard of workmanship would eventually follow.

The experience with uniform price schedules has, however, not been altogether successful except in places far removed from the centers of the bicycle and parts-making industries, and before any attempt is made to reach a general and fair estimate of what each of the most common repair jobs is worth, the causes of previous failures should be looked into.

One of these causes has already been referred to. The schedules which have been adopted have been too purely local. The cyclist who went to a neighboring town with his repair readily found that the prices charged in his own town were founded more upon agreement between repairmen than upon the nature of each case and the work or skill required.

Comparison of the columns in the table in this issue will show that the prices are usually highest in the very small towns, where competition is readily restricted and where facilities, or skill, are at a low ebb. Price schedules prevailing in such places or in towns where very few bicycles are in use or where wages are much above the average, can hardly afford any criterion for computing a reasonable charge in places differently located.

Prices in western mining camps and in the extreme western states generally cannot probably be made subject to rules which would fit other localities nearer to the industrial centers.

In trying to arrive at fair and tenable estimates for such states as Illinois, Michigan, Ohio, etc., neither western prices nor village prices can be considered, and probably it might be found practicable to divide the entire country into four or five districts, each with its schedule suitable to its requirements. The village repairman can take care of himself. It cannot hurt the general trade if he charges somewhat in excess of an otherwise generally prevailing rate.

Reverting to the troubles with previous schedules it is first of all noticed that the repairmen's associations which promulgated them, in all cases when trouble ensued, elected to fix a

minimum rate to which the members were expected to adhere, under penalty for going below them. They were clearly intended to restrict competition and were in opposition not only to the public's desire for the cheapest possible repair, but also to the desires of those repairmen whose skill or facilities enabled them to turn work out below such fixed rates and yet earn a good profit.

In all probability the main cause for their inefficiency is to be found at this point. A repair price schedule should be flexible enough to suit existing conditions, and it should not be plainly inimical to the interests of the public who are expected to pay the charges.

Better results may be expected from a schedule which gives maximum prices for the information and protection of the public while leaving the repairman all the latitude which he may desire for showing special favors to customers by lower quotations when circumstances warrant them. Such a list of standard prices may be compiled, without fear of doing anybody injustice, from the information conveyed in the tables printed in this issue of The Cycle Age and others which will be printed later, by selecting the highest charge made and obtained for each job, respectively, in, say, three towns of large and medium size and making it the limit or standard for all repairmen in the same district.

A table compiled on this plan may be kept tacked up in a conspicuous place in every repair shop, accessible to the public, and while it would be futile to expect that the prices specified on it would always be obtained, it would indicate the spirit—if properly worded—of aiming to protect the cyclist against extortion and would gradually establish an upward tendency of prices toward the standard set, instead of the downward tendency which at present results from the declared antagonism between the trade and its supporters and which draws the repairman irresistibly toward botch work and trickery and diminishes the pleasure and safety of the cyclist.

## AGENTS CULTIVATING BANKERS

It is to be most earnestly considered if the relations between cycle dealers and their local bankers are of the nature and order calculated to work the utmost good and benefit to the business of the former, and inspire the latter with all desirable confidence. In other words, are cycle dealers such regular and valued customers of their local banks as their business would safely warrant? It is not believed that, as a general thing, they are. Yet they should be.

Retailers who can, without assistance, cash discount bills for sufficient stock to equip their stores in good shape for the opening of a heavy buying season, or who can even restock as necessity and convenience require, with their own unaided capital, are a very small minority among the whole. Installment selling, when practiced to any great extent, adds, for weeks or months, to the amount of capital required for the conduct of the business. Rent and office expenses, help and miscellaneous items, draw still more upon the same source, to say nothing about new improvements in the store, new equipment, perhaps greater stock than heretofore carried, etc. Any person or firm having command of enough ready and free capital to meet all current needs, and profit by every opportunity presented, usually puts it otherwise than in such a retail cycle store as would be denominated the average. Ergo, to seek outside assistance, at carefully determined times, and in conservative amounts, is perfectly natural. No citizen of a community knows and appreciates this fact better than the banker. Indeed, there is no reason why the credit of a cycle dealer at his bank should not be equal to the best.

Cordial and confidential relations with local bankers hold one opportunity of positive advantage which, strangely enough, seems never to have been brought to the particular attention of cycle tradesmen. To the bankers of a small city or town especially, the financial standing and responsibility of nearly every person in the community or vicinity is apt to be quite accurately known, and this intelligence may usually be drawn upon by borrowers on reasonable, timely and well-planned inquiry.

Do not be nonplussed if some of your own customers happen to discover that you are a borrower; the fact that the state of your credit and the estimation in which you are held, allows it, will do you more good than harm.

## BRAZING BY IMMERSION

### Open-Top Furnaces Operated Successfully—Even Distribution of Draft—Sunken Ash Pits

It is almost the universal custom in building immersion brazing furnaces to cover the top of the brick structure with tiles, or with a series of fire bricks, so that the heat and flame arising from the fire box will be directed horizontally across the crucible. Such construction has been deemed necessary that the brass in all parts of the crucible may be kept at a uniform heat and the cold drafts from above may not cool off the surface brass. There are two known instances

of furnace building in which the attempt was made to do away with the horizontally projecting cover of flame and heat by laying the upper brick work in such a fashion that the top of the furnace was tightly closed against the passage of heat. Both furnaces were failures.

Doubtless the only instance of successfully operating furnaces in which the common horizontal or slightly inclined cover tiles have been dispensed with is found in the three furnaces now in constant operation in the factory of the Black Mfg. Co., of Erie, Pa. The furnaces are of two styles, one of them having an ordinary brass founder's round crucible and being used for brazing small parts. The other two, which are used for brazing bicycle frames, have the regular oblong trough crucible. The crucibles in these two latter are supported in the common way above a fire box fed with coal and raked down through doors in the ends of the furnaces. The inner side walls of the furnaces are far enough apart to leave slightly more than one inch space between the side of the crucible and the walls. The brick work is not discontinued when it has reached the same height as the top of the crucible, but is extended upward for about six inches further, leaving a longitudinal opening six inches deep and slightly wider than the crucible along the top of the furnace. The flame and heat arising from the fire thus come upward alongside of the crucible in the same manner that they do in the Fulton, Chicago, Welland-Vale and other standard furnaces, but instead of being projected laterally when the upper edges of the crucible are reached, they continue to rise along the wall of the extended brick work until gradually lost in the constant exhaust draft in the hood above.

#### Tube Not Exposed to Fire.

The Black company has experienced no trouble in operating these furnaces, but is not prepared to say if more heat is required than would be necessary were

the cover tiles used. It is probable that the original reason for allowing the flames to rise unhindered and thus lose a part of their efficiency was to obviate passing the frame joints to be dipped through a cover of flame before immersion began.

The point thus taken by the company is a meritorious one from a theoretical standpoint but the value of this caution depends upon the decision of the question regarding the possible injury to the metal when it is lowered through a thin cover of flame, it being kept in mind also that the possibility is lessened in importance by the utility of the flame cover both in keeping the surface spelter in the crucible at the desired temperature and in preventing to a certain ex-

tent the oxygen in the air above from attacking the spelter and causing the volatile zinc in the alloy to burn out.

#### Round Crucible Banked With Coals.

The third furnace in the Tribune factory—that having the round crucible and used for brazing small parts—is quite simple in construction, the crucible being unsupported by aught else than the coal in the fire box, which is banked around the crucible to within an inch of its upper edge. The heat in this furnace covers the entire top of the crucible on account of the small size of the latter in comparison with the large uncovered fire surrounding it. In both styles of furnaces the crucibles have given satisfactory service for three weeks or more, the heat during use being maintained at a temperature sufficient to keep in a molten condition spelter containing from 65 to 75 per cent copper. The furnace with the round crucible presents a somewhat crude appearance in comparison with some of the more elaborate furnaces in use, but the operators state that it has given perfect satisfaction in every respect, and that it is very easily managed.

#### Distribution of Air Draft.

In each of the Tribune furnaces the incoming draft under the fire box is distributed in an original fashion. The inlet pipes are two inches in diameter and carry air under a six-ounce pressure to each end of the furnaces. From there the diameter of the pipes is reduced to one inch, these inch pipes extending inwardly below the fire box in a longi-

tudinal direction. The ends of the pipes are closed, but each is perforated along its upper side, there being on each pipe a series of one-eighth-inch holes. Direct air draft is thus furnished every part of the fire box, the distribution being much more even than if the draft were fed through a couple of comparatively large openings. The fuel used in all three of the furnaces is coke, it being preferred to anthracite coal by the operators because no clinkers form in the fire box when it is burned.

#### Ash Pit Below Floor Level.

The company realizing that systematic and easy handling of work is of as much importance in successful immersion brazing as well heated spelter, designed its furnaces so that the workmen would not be compelled to lift the frames and parts to be brazed to an undue height in dipping them. So the ash pits below the grates were sunk below the floor level, and an exterior pit in front of each furnace end left in the shop floor that the ashes from the interior pit might be conveniently raked from the furnace. This feature is new, and where dip brazing furnaces are installed in ground floor rooms of factories can be adopted with but little added expense or trouble. The top of the crucible can thus be lowered about six inches and the operator saved the work of raising each frame just that much.

#### Removing Impurities from Spelter.

But little attention is generally paid to the iron which scales from the frame tubing and mixes with the spelter in a crucible used constantly. Just what percentage of iron is thus mixed with the brass is hard to determine, and to what extent it becomes a detriment to the spelter is a question upon which no exact data has as yet been gathered. The Black company, however, in order to be on the safe side endeavors to flux out every second day what iron has been left in the brass, and uses in doing so a specially prepared flux which attracts the particles of iron and draws them to the surface, where they may be skimmed off with an ordinary ladle.

Dip brazing has proven an unqualified success in this factory and while the managers are too conservative to make bold statements concerning lightened brazing expenses beyond the matter of reduced fuel costs, they believe and say that the quality of the brazing turned out is so superior to the results from ordinary flame brazing that the immersion process is worthy of wide adoption regardless of the financial side of the proposition.

## BEEBE STRIKE ENDED

### Difficulty Settled by President of Bicycle Workers Union—Men Return to Work.

The piece workers in the factory of the Beebe Mfg. Co., of Racine, Wis., who went on a strike March 25 because demands of discontented frame filers had not been acceded to, have all returned to work, the matter having been amicably settled. The cause of the strike was the installation in the Beebe plant of a chemical frame cleaning process which took away part of the filers' work and so necessitated a reduction in the piece work scale for filing frames. The management states that at the time of the change the filers agreed to a readjustment of wages and were able to make as much, if not more, money per day than formerly. Later on, however, the filers became dissatisfied and declared that if their wages were not raised the entire factory force would be called out on a sympathetic strike. The demands of the filers were not granted and the men went out.

In effecting a settlement slight changes in the factory system of handling the work which is cleaned of part of its

superfluous spelter by chemical means and afterward finished by filing, were suggested and adopted, so that the relations between the filers and their employers should be more pleasant in the future.

### DIP BRAZED FORK CROWN

Fork Sides Securely Brazed to Tubular Crown—  
Method Employed by Ariel Cycle Mfg. Co.

The accompanying half-tone illustration is a reproduction from a fork crown brazed by immersion and then sawed in two to note the flow of brass on the inside. The work was done in the factory of the Ariel Cycle Mfg. Co., of Goshen, Ind. Though the exact appearance of the coating of brass cannot be seen in the illustration, it was nevertheless noticed in the original that but few lumps formed on the inner walls of the tubular crown and tubing, the brass having filled the joints and then flowed out of the part as it was lifted from the crucible, leaving only a thin coating over the interior surfaces of the fork. The Ariel Com-

pany uses the dipping process exclusively in brazing fork blades to the crowns. The fork stems are afterward brazed to the crowns on an ordinary flame brazing table.

### MONEY IS PLENTIFUL

Local Industrial Conditions in Milwaukee Presage  
Large Sales of New and Second-Hand Cycles.

Milwaukee, April 3.—Bicycle riding will be more popular here this year than ever before if indications count for anything and the usual signs by which dealers are wont to base their prognostications upon do not fail. While there have been few actual purchases as yet, inquiries have been many and from people in all walks of life. There is one noticeable feature this season, and that is the fact that everybody seems to have plenty of cash. There are various reasons for this. The town has not quite recovered from the savings bank panic and the failure of several building and loan associations recently, so that the people have little confidence in these institutions. This, together with the fact that factories and shops have been running full nearly all winter at better wages than for the past five years, has operated to give Milwaukee people, particularly the working classes, a surplus of cash such as they have not known for years, and in consequence bicycle dealers are anticipating a good season.

Another peculiar feature and one that shows that hundreds of people will ride this year who never rode before, is that most of the dealers are requested to figure on second-hand machines. Dealers came out about even on second-hand ma-

chines last year, but they are expecting to make money out of the trade this year because there have been numerous inquiries with but small supply. Agents will allow only what they think they can sell the old machines for, in making trades. Second-hand bicycles at from \$7 to \$15 go fast, though as high as \$20 has been received for a machine of the vintage of '96 in good condition.

A careful canvas of the cycle repair shops and the smaller establishments reveals that Milwaukee has exactly eighty-three places where sick wheels can be cured. As a result of the work that has been done in the interests of the Milwaukee Repairmen's Protective Association, seventy-three out of the number have agreed to join the association and a committee is now hard at work mapping out a constitution, one that will be sufficiently effective in guaranteeing its members protection by punishing those who do not observe the rules and regulations. At the present time nearly every dealer has his own list of prices, and no two are alike, which is demoralizing to the trade. A schedule will be made up at the meeting this week which will be uniform and which will determine what prices shall be charged during the season.

### VARIABLE PRICES A BOON

Peculiar Conditions of Repair Trade in Lynn Justify  
Refusal to Adopt Standard Prices.

Lynn, Mass., April 3.—The issue of the Cycle Age for March 23 conveyed much information of the adoption of repair and stock schedules by cycle dealers in various parts of the country, and in the same issue is mentioned a single instance in which friendly co-operation to insure uniformity of prices was apparently refused. Had the last named fact been quoted as occurring in any other considerable city in New England except Lynn, surprise might have been naturally occasioned, but to those who are sufficiently familiar with the peculiar situation of this ancient town, and its trade relations to the surrounding territory, the refusal to so combine assumes a certain form of reasonableness.

Lynn is a great manufacturing center, a majority of whose inhabitants are workers in the many shoe and other factories located in or near the city. Wages are not high, living is cheap, and almost the entire business of the town feels the influence of the humble means at the command of the great mass of the people. Selling stocks of all kinds are of lower average grades than those found in the wealthier and more aristocratic localities immediately adjoining.

Another feature having an important bearing on the case is the fact that, to a considerable extent, the moneyed people of Lynn make their purchases in Boston and elsewhere, leaving the local business very largely in the hands of residents of moderate means. As a result, the bicycle tradesman who expects to cater to all-the-year-round home patronage, either selling, renting or repairing, must content himself with small charges and meager profits—which are, however, seldom sacrificed on the altar of bad credit.

The transient patronage falling to the lot of the cycle dealers of Lynn is, however, of a most radically different nature. Through that city passes, throughout the summer-time, undoubtedly the most constant stream of pleasure-seeking cyclists to be seen on this continent, if not in the whole world. It is the converging point for all the highways and railroads northeastward from Boston. The wagon roads from East Boston and Winthrop, across the Saugus meadows, take you inevitably there, as do also those lead-

ing from Charlestown, Cambridge, Somerville, Medford and other suburbs, in the same direction, it is on the direct route to Beverly, Salem and Marblehead—to Portsmouth, Portland, the Maine coast and the White mountains, and it is the background of the popular peninsula of Nahant, to which hundreds of visitors go by boat daily. The whole region is, from May to October, a veritable cluster of resorts. It is the harvest season for the cycle men of these localities—many of whom could not exist on the sluggish home patronage alone. At all hours of the day and night—and especially on Sundays—punctures, breakdowns, etc., occur, and to the nearest repair shop come the bothered riders, every one of them anxious that his piece of work shall be done without delay.

It is only reasonable to suppose that, having such widely different classes of patrons to deal with, absolute uniformity in prices—such as would be rendered obligatory by a general agreement among competitors to that effect—could not be adhered to save at a loss of a considerable sum to each dealer during the season. It is perfectly right, both in theory and practice, to charge slightly higher prices for work done under unfavorable conditions. The passing rider who asks or insists that you shall drop your work at the sound of his footstep on the door-sill and attend to his wants immediately, does not, as a rule, object to paying reasonably for the inconvenience his job involves over another who may bring a piece of work in and call for it a day or two later. This transient rider very likely says to himself: "This puncture (or break-down) is unlucky for my purse, but it don't happen every day," and goes on his way rejoicing. That Sunday and late night work deserve additional compensation no one competent to judge will deny. Of this the repairmen of Lynn and vicinity have a great deal to do, perhaps more than those of Salem, Beverly, Danvers, Peabody and other surrounding towns combined. For this reason they do not feel exactly like binding themselves to a uniform scale of prices, suited necessarily much more to others than to themselves. The purpose of the present communication is to explain how the "Refusal to Combine," noted in The Cycle Age, was not prompted on the part of the cycle dealers of Lynn by any unwillingness to consider the welfare of others together with their own, but to show the unusual conditions with which these tradesmen have to deal. VERITAS.

### Stamp Drafts When Issuing.

Washington, April 3.—The following letter has been extensively circulated over the signature of a western bicycle manufacturing company, viz:

Collection drafts, according to a recent decision of the Treasury Department, become subject to the war tax stamp duty upon payment only, and if payment is refused no stamps are required to be attached to papers of this kind.

We, therefore, ask you to affix the proper stamp to within draft and cancel same for us when paid and add amount to your collection charges.

The attention of the commissioner of internal revenue has been called to the above letter, and he says there is no foundation for such a statement, no such ruling having been made. On the contrary, there has been a uniform ruling to the effect that all drafts must be stamped at the time they are issued to the drawer. Every person, firm or corporation circulating the above notice is promoting and advising a violation of the war-revenue act, and collectors of customs throughout the United States have been called upon to aid the department in the suppression of this or any similar notice.

## PLAIN TALK TO DEALERS

### The Nature of the Public Demand is Regulated By the Work Methods of Makers and Sellers

What is the immediate future of the retail cycle trade? What influences are at work for the good, and what for the ill of the trade? What mistakes have been made in the near-by past, and what should be learned therefrom? I will not say "What shall we do to be saved?" for we are not yet lost, but we are, many of us, on the wrong track, and now is the time of all times, now the moment of calm preceding the rush of spring selling when serious thought should be given these questions which lie so close to the purses of the retailers everywhere. Let every dealer metaphorically take himself one side to some quiet spot and talk things over frankly with himself. Don't try to fool yourself; don't try to reassure yourself with vague, undefined hopes that "this year everything will be all right;" don't leave your future actions and policy for chance to determine. You can't afford to do any of these things. The last man on earth who you can afford to "fool" is yourself.

The selling of bicycles is a business, and like any other business must be carried on on business principles and by business men to be successful. The man who is successful in other lines will be successful with bicycles if he will apply the plain rules of business to the wheel line.

#### The Eternal Cry is "Cheaper Wheels!"

So much for generalities, now to get down to business talk. What, if anything, is wrong with the trade today? Is cycling decreasing? No. Has public buying decreased? No. Is the market overcrowded? Not so much as formerly. Are prices too high? Well, hardly. Are times hard? Decidedly not. What is wrong, then?

Well, for one thing, you, Mr. Dealer, have thoughtlessly allowed yourself as a class to be led into the craze, born of a scalper sired by a department store and espoused by the auctioneer, for crying for "cheaper wheels, cheaper wheels, cheaper wheels!" And when you got them still again renewing the cry, seemingly feeling that price was the only consideration and that quality cut no figure either for you or your patrons. Now you for two years past have had your cheap bicycles, and what good have they done you? Have they increased your profits? Have they added to your prestige? Have they made friends for you? Have they given you less trouble than you formerly had?

Right here I want to say that, in common with any well informed person, I believe in honest priced bicycles, not fictitious prices, but first of all good bicycles, then fair prices. By "cheap" is meant any cycle retailing for \$25 or less. Reliable cycles are not being made or sold at such prices.

#### Analyzing the "Public Demand."

But you say: "The public demands these cheap bicycles." Nonsense. The public demands whatever the trade and dealer teaches it to demand. Have you forgotten that it is only two years since this same much talked of public demand was for bicycles at \$100?

Was the public ever better satisfied than at that time? And why? Simply because they were furnished good bicycles for their money. True such a price would be unfairly high for the conditions under which cycles are now made and

marketed; but it possessed one great advantage for the public that it was to a large extent a guarantee of first-class goods, for there did not exist the present temptation, or perhaps I may better say necessity, for makers to tamper with the quality of their product.

Have you forgotten that the bicycle trade was developed from nothing at all up to its most prosperous condition and maximum volume at from \$100 to \$150? The public did not demand anything below these admittedly abnormal values until the trade taught them to. The public today does not demand anything below a fair price for a reliable article only as it is told to do so by some short-sighted dealer or some scalper that the Faque is "just as good" and it is only \$18.67. That is the kind of talk that is wholly responsible for all this much talked of demand for cheap machines, and without such talk there would be no such demand, and every honest dealer who is unwise enough to talk such things to his trade and to supply that class of goods is his own worst enemy, and the scalper's best friend.

The great bulk of the public really and honestly desire to purchase reliable bicycles; they do not want and, if properly informed, will not buy trashy stuff. Not one man in one hundred will knowingly buy a snide bicycle. How many hundreds and thousands have innocently bought such stuff, and been imposed upon to their disgust and anger? It is pretty safe to say that no dealer ever fooled a customer the second time in this matter of selling him some one of these wonderful "just as good" machines.

Did you ever know a man who bought a cheap bicycle the second time? Did you ever see an experienced rider using one of them? Do well informed people ever throw away their money on this kind of trash? Can a reputable retailer afford to sell such stuff under any circumstances?

#### Philosophy of "Just as Good."

Supposing the majority of retail jewelers should at once commence telling their customers that some of the \$1 and \$1.50 watches were "just as good" as an Elgin or Waltham. Well informed people would carefully keep away from any store where they had been told such a palpable untruth, and would make their purchases elsewhere. But the uninformed would in large numbers believe and buy. And what then? First, the watch market would be upset; second, the dealers would find their trade running toward a class of goods on which the percentage of profit might be all right, but the aggregate in dollars and cents would not pay them; third, the deluded people who bought those "just as good" watches would have their mistake brought home to them, more or less forcefully, and would buy another and better watch of some other dealer. There is nothing particularly new in this argument, but it is so true that it has always been admitted as applying to all lines of trade, although truth compels the statement that in the mad rush to get under an imaginary cover a large part of the retail cycle trade seem to have forgotten this and many other truths which it might have been better to carefully remember.

You have probably often realized that the department store and the cheap cash

order house are the enemy of the legitimate retailer of bicycles. Did you ever stop to think that the maker of the very low priced bicycle is in the same class; that all three alike and together are joined in a short-sighted, reckless scramble to educate the public to expect constantly lowering prices, and to be satisfied with constantly decreasing quality? The only inducement they offer a buyer is price, and their business depends on being able to offer lower and lower prices day after day; and when they reach bottom and have nothing more to offer, their argument is gone and their trade lost. The retailer who tries to follow their lead suffers, for they are always ahead of him and getting the best of him, and pretty soon he finds his profit, his reputation and his trade all gone, and all to the glory of the scalper.

#### Impossible to Beat the Scaplers.

You cannot beat these people at their own game, and the more you try it the more you help them and hurt yourself. You haven't their opportunities for picking up and marketing large job lots of trashy bicycles, and, even if you had, do you want to do it? Do you want to become identified with that line of trade? Would it not ruin your standing in all your staple lines? Do you want to help these people educate the public to their ideas, and thus induce buyers to expect and demand what you can never profitably supply?

Your present profit and your future business life depend upon actively opposing those who would undermine your trade, and who will cause you to tear down and ruin what you have built up by past work if you attempt to beat them at their own game. Follow the other course. Expend your effort and your talk in teaching and showing the public the difference between good and bad bicycles; in making it clear that first-class goods cannot be had for third-class prices in bicycles any more than in other lines. Appeal to the reason of your customers; call on their common sense; show them the advantage of dealing with a responsible dealer who has the interest of his customers at heart, and who will be on hand when wanted; let them see the value of buying the product of a responsible manufacturer whose goods are known to be as represented, and whose integrity and reliability are established beyond question; give the prospective buyer something to think about; don't let him thoughtlessly waste his money on some piece of clap-trap just because it can be had at a clap-trap price.

#### Three Things to Remember.

Educate the public away from department store and bargain counter ideas; then they will buy of you. But every time you persuade a man into the "just as good" idea you make a prospective customer for your own worst enemy and lose a customer yourself.

Sell bicycles which will build up your trade, not tear it down; bicycles which you know are all right and reliable and which you can conscientiously recommend; bicycles which will establish and constantly improve your standing in your community.

Another point: Don't think too much of quantity, of volume of business done. The dealer who sells the greatest number of bicycles is frequently the most unhappy. Better sell a reasonable number of good machines at a fair profit on each than to dispose of a great lot of "bargains" at unhealthy margins and give your customers a lot of so-called bicycles which keep them and you in hot water perpetually.

#### The Trade That Pays.

The retailer's only safe, sure and profitable course is to be the true and trusted

TRADE MARK

# The Dunlop Catalogue

For 1899 is ready for distribution. We want to send some to every dealer. If you have not already sent in your request, we shall be pleased to hear from you by return mail

## The American Dunlop Tire Company

Belleville, N. J. Chicago, Ill.

TRADE MARK

# THE STERLING

“BUILT LIKE A WATCH”

### QUALITY VERSUS PRICE.

Some manufacturers are able to sell their product at better market prices than their competitors. Their output may not be as large, nor their advertising as extensive, but their goods find a more ready sale.

### WHY?

Because they have established for their wares a reputation for actual merit combined with progressive features, and buyers know exactly what to expect in return for the investment of their money.

### STERLINGS, FOR INSTANCE,

have founded their well-known reputation upon *honest construction, honest dealings, and honest protection* to their agents. The material composing them is the best, the workmanship of the highest class, the features radical and distinctive, the equipment high grade only, the guarantee liberal and the policy broadguage.

THEY ARE SOLD UPON MERIT, NOT UPON PRICE. Decidedly it is to your interest to represent a wheel of this kind. Our proposition awaits you.

## STERLING CYCLE WORKS KENOSHA, WIS.

friend and adviser of his customers. Any man feels perfectly safe in buying a pound of nails at the first hardware store he comes to, but when it comes to the purchase of an expensive article of special manufacture, regarding which he feels the need of correct information and honest advice, he goes where he feels he can place confidence. A man will walk several blocks to deal where he knows he will be told the truth and given just what he is promised, and when he gets there he will nine times in ten buy a good article and pay what it is worth if all sides of the matter are fully, fairly and intelligently shown up to him. That is the kind of trade that pays, and when once established cannot be lost except by abuse of the confidence reposed. No other dealer with all his frantic cries about "bargains," "just as good," etc., etc., can ever disturb you if you have earned and secured the confidence of your trade.

RETAILER.

**Receiver Held Liable for Purchases.**

The action brought by the Sager Saddle Manufacturing Company of Rochester against Frank Sullivan Smith, receiver of the Worcester Cycle Company of Worcester, Mass., to recover the sum of \$225, alleged to be due on account of the purchase of a number of saddles April 29, 1898, was last week decided in favor of the plaintiff. Some days ago the attorney for the defendant moved for the dismissal of the complaint, the principal ground being that Smith was sued as an individual and not as receiver of the works.

The court declined to dismiss the complaint. In his decision Justice Nash settled the point in the following language:

A receiver of an insolvent corporation cannot charge the estate by his executory contracts unless especially authorized and empowered by the court, and without such authority he acts upon his own responsibility and is individually liable upon his contracts.

The decree authorized the defendant to carry on and continue the business of the company for the purposes specified in the decree. It is questionable whether the authority was sufficient to purchase goods generally in the transaction of the business without regard to the purpose for which they were purchased.

But there is a further ground upon which the defendant must be held personally liable for the purchase price of the goods, and that is, the defendant could not transact the business *virtute officii* in this state, that outside of the jurisdiction of the court appointing him as receiver he acts as an individual.

The persons with whom he deals are not presumed to know his authority. He cannot go to the court appointing him for instructions or authority for his acts here, and persons with whom he contracts cannot apply to the court to enforce its orders with respect to the transactions of the receiver within this jurisdiction.

**Receiver for Cream City Co.**

The Cream City Cycle Company of Milwaukee, Wis., passed into the hands of the courts last Saturday and William J. Krauthoefer was appointed receiver to take charge of the company's affairs under a bond of \$5,000. The receivership is the result of a suit instituted by the Claus Handle Bar Company in December to recover \$205.42 on account. Judgment was entered against the company for \$245.60, and as no one appeared to contest the suit the court issued an order restraining the creditors of the company from bringing suit against the company or the receiver. The creditors are also ordered to file their claims with the clerk of the court within six months. There will be no notice to the creditors beyond that conveyed by an official publication in a little weekly paper published in Milwaukee.

For a number of years the Cream City Cycle Company maintained one of the largest retail stores in Milwaukee, and handled a large line of bicycles in addition to several of those of its own manu-

facture. The president of the company was at one time president of the Claus Handle Bar Company, the present plaintiff in the suit. The appointment of a receiver has caused considerable surprise among dealers in the city, who supposed the company was in fair circumstances.

**LONG DOWNWARD STROKE**

**Inventors of Irregular Crank Motions Disregard Uneven Torque on the Bicycle Crank Shaft.**

While motor vehicle makers and every other manufacturer of machinery realize that the driving power should operate with a constant torque upon the driving shaft, if possible, in order to get the greatest efficiency, and employ fly-wheels for this purpose when they can do no better, designers of bicycles—some of them—persist in following a diametrically opposite course. If the bicycle were not in itself a fly wheel which by its momentum assists the rider in getting over dead centers, these designers would find themselves quickly able to discover that they are on the wrong track, whenever they provide for "long leverage on the

down stroke." They seem to reason that because a rider can apply power economically for only about 90 degrees of the pedal circuit for each foot, he should be enabled to apply as much power as possible during that portion of the circuit, so as to kick the crank around for 90 degrees more. That is precisely what the piston of a single cylinder gas engine does and what the fly wheel is designed to neutralize. It is also precisely what constructions of gas engines or steam engines in which power is divided between two or more cylinders, are designed to obviate. The bicycle designers do not seem to perceive that whenever they lengthen the crank for the downstroke the sprocket wheel is rotated a smaller angle while this additional power is being applied, than the cranks are rotated.

The dead centers are increased. On the other hand a more nearly constant torque would be obtained if the sprocket wheel were forced around a greater angle than that traversed by the pedal while the rider is in a favorable position to apply power. That would be the result if the crank were shortened for the downstroke.

The most recent application of the wrong principle—the "kicking" system, has just been patented by a Rochester inventor and is shown in the accompanying illustration. It would be made rational if the disk to which the cranks are attached had their center to the rear of, instead of in front of, the center of the sprocket wheel. By making this change the inventor would find himself able to climb a steeper hill or face a stronger gale than with his proposed arrangement. As he has it in his patent, while his foot travels the angle x his sprocket wheel travels only the angle y, which is smaller. The difference must be made up by momentum, and on a hill or against a strong wind the momentum tends toward zero.

**Exports of Cycles and Materials.**

Exports of cycles and cycle materials from the port of New York for the week ending March 28 are recorded as follows:

	Bicycles.	M't'ls.
Germany . . . . .	\$ 70,809	\$ 9,472
England . . . . .	12,066	14,067
Denmark . . . . .	21,922	764
Holland . . . . .	14,611	3,051
Sweden . . . . .	10,976	1,796
Argentina . . . . .	9,611	537
Belgium . . . . .	6,845	1,088
Russia . . . . .	3,529	230
British West Indies . . . . .	2,408	976
Cuba . . . . .	1,041	28
Australia . . . . .	795	583
Mexico . . . . .	550	356
British Guiana . . . . .	498	10
Austria . . . . .	...	321
Greece . . . . .	274	...
Egypt . . . . .	273	...
Bavaria . . . . .	...	207
Prussia . . . . .	...	200
British East Indies . . . . .	...	140
Brazil . . . . .	...	108
Scotland . . . . .	90	...
Uruguay . . . . .	73	...
Italy . . . . .	40	33
Portugal . . . . .	40	...
Totals . . . . .	\$156,451	\$33,967

Austria manufactured 70,000 bicycles in 1898, which is almost twice as many as were made there the year before. Of this number 8,690 machines were exported during the year, as against 5,735 the previous year. The imports increased 37 per cent.

**LA DANOISE CHAINLESS PATTERN.**

From the elaborate and artistic catalogue of Northern Cycle Mfg. Co., at the freeport of Copenhagen, Denmark, it is seen that the "La Danoise" chainless pattern of which this company makes a specialty has been reduced in weight to 28 pounds and that its makers consider it the most successful pattern of chainless machines made in Europe. It is constructed mostly from American material—Williams forgings, Union stampings, Garford and Hunt saddles and Billings & Spencer forkcrowns. The driving gear is a beveled crown gear meshing with rollers revolving each in adjustable ball bearings as shown in the illustration. This elaborate form of construction is probably accountable for the width of tread and large spread between rear forks. The price at which the machine is sold in Denmark is 400 kroner, equal to about \$110; but in proportion to the earning capacity of the average cyclist in Denmark and adjoining countries it represents a considerably larger amount in American money.

## COMMERCE IN FOREIGN MARKETS

### LIMITED MARKET IN WEST INDIES

The bicycle is not yet established among the people of Trinidad in the British West Indies on account of the poverty existing. It is very popular, however, with the better class who are able to purchase. The masses would like to own them and low priced machines could be marketed to advantage. The roads are fair and the cities are very well provided for the pastime.

Nearly all the bicycles in use there are from the United States and Great Britain. The retail price is from \$25 to \$125, cash or time payment. The merchants usually handle bicycles as a side line. Catalogues and information should be printed in the English language.

### HOW TO TRAVEL IN SOUTH AMERICA

A traveler looking for business in South America should arrange to consign samples to firms along the route, as by so doing he can legally exempt himself from paying the foreign commercial travelers' licenses which are enforced in a great majority of South American cities. By transferring samples to agents and having them come through the custom house consigned to them you temporarily transfer your allegiance from the home concern and become an employe of your agents. Do business under their supervision, or allow them to do it for you. You are then working under the privilege granted to your agents by the payment of their annual tax, and cannot therefore be classed as representing a foreign concern.

If possible get up a special cable code which will apply directly to your own requirements. For the transmission of general information the published codes are useful, but with the exception of the staple products none of them can be used either practically or economically for forwarding rush orders. It is not a difficult matter to build up a private code, which, with from three to five composite words, will convey a detail order. By adopting a short root word for each article and variations of it in your line, and having a set of prefixes which can be added to the root to denote grade and a suffix to denote some other important detail, a great deal of information can be conveyed in one word.

Get a passport. Revolutions are frequent in some parts of South America, and often break out when least expected. During such periods of war, when suspicion is aroused and a great deal of responsibility is given to ignorant soldier-policemen, an American passport may be found a convenient thing to possess, owing to its identification feature.

Don't depend upon receiving regular remittances from the United States in order to continue your journey, as the mails are infrequent and very irregular. Get a letter of credit sufficient to cover the total expense of the trip and allow a fair margin for unexpected expenditures.

Get as many letters of introduction to South American merchants as you possibly can, but be sure that they are of the right sort. A letter from an intimate acquaintance who can vouch in strong terms for your character and standing, directed to a friend who is a person of influence, especially if the party be a native South American, is worth a great deal. It will often procure for you both business and social favors which money could not buy. It is a mistake, however,

to convey or present the ordinary letters, which are the least difficult to secure. From such letters you may obtain more or less information and perhaps a little attention, but experienced travelers do not depend much on them.

Several months previous to starting on your trip institute a systematic campaign of advertising, so planned as to make all possible buyers along the line acquainted with your concern and the goods it manufactures. This scheme is especially advisable in cases where a concern's product is unknown.

Above all things secure from your house a power of attorney in English and Spanish, so constructed as to leave no doubt in the minds of agents, customers or anyone you are likely to transact business with, as to just what powers have been invested in you. This is positively essential. In the past so many unauthorized individuals have made contracts with South American buyers which have never been fulfilled, and thus caused no end of trouble and loss, that a power of attorney is now invariably requested when a contract of any importance is to be signed. Especially is this required in case you are commissioned to make any collections, transact any legal business, register trade marks, secure patents or establish agencies.

### JAPS PREFER HOME MADE BICYCLES

There are very few bicycles in use in Nagasaki district of Japan, but importers report the demand to be steadily increasing. American, British and Japanese machines are sold, the American model being the favorite with purchasers, but on account of its being higher priced than the other machines there are fewer of them in use. The native machine is most in demand. American machines sell from 75 to 125 yen, British from 65 to 85 yen. The yen is about equal to 50 cents gold. The American machines now for sale at Nagasaki are from the establishment of a large grange house in Chicago and a scale manufacturer with headquarters in New York City, but the original name plates have been removed and others substituted.

### AMERICAN BICYCLES IN FORMOSA

Bicycles which can be sold for \$50 and still leave a little profit to the importer are most in demand in the island of Formosa. If a strong bicycle with good tires could be laid down there to sell for \$37.50 it would be very much in demand. The first bicycle in Formosa was brought there last spring. There have been many inquiries made for bicycles, but, owing to the absence of a house understanding the trade and willing to order a stock, but few machines have been obtained. As evidence of the interest shown, it may be stated that a consignment of one dozen was sold the same day it was unpacked. A woman has never been seen astride a bicycle in Formosa.

There is a very limited demand for parts and sundries. There are a number of roads suitable for bicycles which have been constructed by the Japanese during the last few years, and the mileage is steadily increasing. The bicycle trade with this country could be improved by placing with the American consuls catalogues with lowest discounts, in order that inquirers may ascertain just what machine they consider best suited to the island and learn just what the cost will

be without resorting to correspondence, which means three months' delay and is discouraging at the outstart. Goods from America are sent either from San Francisco to Hong Kong via Pacific lines, then on to Formosa by Douglas S. S. Co., or via Suez steamers from New York to Hong Kong.

American makes are the only ones represented in the island at present, and if some suitable machines could be quickly introduced there would probably be no danger from outside competition for some time. Bicycles sent to Formosa should be complete with all attachments—bells, lamps, repairing outfits, pumps, tool bags and tools and, without fail, brakes. Residents here have an idea that no machine is complete without the latter attachment. Some machines should be equipped with steel rims, which many people prefer.

Two consignments of American bicycles have been lately received, and they were found very satisfactory, with the exception that the order, which called for a complete outfit—bell, lamp, brake, pump, etc., as these articles are not to be obtained here—was not filled, the machines being sent in one case without the bell and brake and in the other without pumps for inflating the tires. The result is that the latter machines must remain on the dealer's hands, losing in the climate much of their brightness, during the three months necessary to obtain the pumps from New York. In the first instance, the exporter wrote that the machines were not equipped with a brake because this was of no practical use and was sure to injure the tire. The result was that two customers, for whom machines had been specially ordered, refused to accept them; and the native dealer, who had for the first time received a shipment from America, while able to dispose of the whole consignment, was considerably annoyed.

### SELLING AND SHIPPING TO RUSSIA

Bicycle traveling salesmen should visit Russia during January, certainly not later than February. All machines must be delivered in March or April. It is only possible to ride out of doors in Russia four or five months of the year. Five or six weeks must be allowed for the time between dispatch and actual delivery of the goods. Shipping firms will declare that three weeks' time is sufficient for the dispatch of goods, but in practice this does not prove to be the case. Cycle salesmen must speak German; prices must be reasonable and the goods attractive and up-to-date. A Russian buyer is fond of the products of foreign countries.

### AUSTRALIANS LEANING TOWARD AMERICA

The people of New South Wales are awakening to the fact that they can purchase a better grade of goods from the United States at lower prices than they can purchase from England. Business men have expressed their willingness to co-operate with the United States consul in his attempts to bring about closer business relations between this country and their colony.

The municipal council of Budapest, Hungary, has established a bicycle tax of \$2.20 per machine. Foreigners staying more than eight days in the city will be subject to the license.

## HINTS FOR REPAIRMEN

### Removing Large and Small Frame Dents—Convenient Filers' Tool—Cure for Wrong Length Spokes

Dents Removed  
by Air  
Pressure

A correspondent who has successfully removed kinks and dents in frame tubes by means of compressed air, contributes some suggestions regarding the pneumatic method described in the issue of March 16 of Cycle Age. One obvious improvement upon the method suggested is that in most cases the seat post in the frame to be repaired will close the seat mast practically air tight, and by leaving it in place no clamp will be needed at this point, and the valve for the inflation of the tube may be placed in either the head or hanger clamps. The use of a universal clamping piece for the seat mast is thus avoided.

The correspondent further suggests that, in order to limit the heat applied to the tube to the exact location of the dent, wet cloths be wrapped around the tubing on either side of the dent. The cloths also keep the enamel from being burned at any other point than exactly at the dent. This provision is valuable when the customer for whom the job is being accomplished is not such a stickler for appearances that he will require the entire frame to be enameled, but will allow the repairer to patch as well as possible the spot where the enamel was burned from the frame. When the tube has expanded till it is nearly round, a small light hammer may be used to finish the work by rapidly and lightly tapping around the edge of the dent. This will have the effect of bringing out the hollow parts rather than of denting the tubing where the blows are struck. Usually, however, the use of the hammer is not necessary, the expansive power of the compressed air at the heated portion of the tube being sufficient to restore it to normal shape.

Should the frame have a number of dents close to each other in one general spot, and they do not come out evenly, the dented portion of the tube should be heated and immediately clamped between a pair of metal tubing clamps in a vise, the tubing being worked between the clamps and the internal air pressure increased until the tubing is expanded so that it binds in the clamps. This process will generally leave the work in a condition so that it can be readily finished with a hammer used in the manner just mentioned. No attempts of this character should be made over reinforced tubes, as the reinforced tube wall will be found to be too strong to yield readily and the heating required might cause the brass between the tube and the liner to melt and run from the joint.

Quick Cure  
for Small  
Kinks

Anent the general subject of removing dents from frame tubes the respective practices of three western repairers in taking out quite small dents furnish good illustrations of the readiness with which some mechanics arrive at the simplest manner of doing a certain thing that others can only accomplish after a tedious and much more expensive operation, and generally a less satisfactory method in the end. The first of the repairers in question proceeds as follows: A small hole is drilled in the middle of the dented portion of the tubing and

through it is slipped a hook made from a piece of wire, such as a spoke. The dented portion is then heated and the smashed-in wall pulled out to its normal position with the hooked wire. Afterward the hole is plugged and the tubing re-enameled.

The second repairer starts at the job in the same manner, but as soon as the hole is drilled he taps it out with a suitable tap and screws into it a threaded plug. By holding the projecting plug in a hand vise the tube wall is drawn outwardly into place. The hole, after the removal of the plug, is filled with a soft iron plug, filed off flush with the tubing and covered with a small daub of air drying enamel.

The third man, instead of drilling the hole through the tubing at the dented place, drills on the opposite side of the tube exactly back of the dent. Then with a small punch the dented wall is driven back into its proper position with a few light hammer taps. The hole is plugged with brass wire and the spot touched up with air drying enamel.

All three accomplish exactly the same result, but the first, on account of having to pull the wall out with a light wire hook, finds it necessary to heat the tube and thus ruins at least four square inches of enamel on the tube. Considering the job is merely that of removing a dent not more than one-half inch across, the injured enamel must prove as great if not a greater evil than the original dent. The second man does not resort to heat as an aid, but takes the pains to tap out the hole and to thread a steel plug with which he can get sufficient holding power to pull out the smashed wall. The third repairer obviates both the necessity of re-enameled and of threading the hole and making a plug to fit it by simply drilling the hole on the opposite side of the tubing and driving the tube wall out to place with a common punch such as is to be found on every mechanic's work bench.

Utilizing  
Wrong Length  
Spokes

A country repairman was recently requested to do a job of bicycle remodeling which included the substitution of thirty-inch for original twenty-eight-inch wheels. He accordingly sent to the nearest market for spokes long enough for the thirty-inch wheels, not having any of such length in stock. The spokes were received shortly after the work of remodeling and enameled the frame had been completed, and the shopman promised his customer to deliver the completed machine on the day following. When the wheels had been laced up and the work of tightening the spokes was found that the spokes were fully one-fourth-inch too long and that the nipples would bind before the spokes had been pulled tight enough to allow the wheels to be trued. The machine was to be delivered the next day, there were no more spokes to be had within two hundred miles from the locality of the repairer, and there was no die in the shop or in the town matching the rolled threads on the spokes. To use his own term the repairer was "up against it." However, remembering the

old adage, that "necessity is the mother of invention," the repairer did not give up in despair, but thought upon the matter a few minutes and then unlaced both wheels and started in anew. This time he crossed each spoke over four of those running in the opposite direction from the hub flange instead of over the usual three and was rewarded by finding that his spokes by this crossing were exactly the right length. The wheels when trued up had a slightly heavier look than they would have had were the spokes crossed in the common fashion, but no one ignorant of the manner in which the job had been accomplished would have discovered the difference.

Filing  
Jig for Cross  
Braces

The illustration furnished herewith shows a convenient jig for holding rear fork and stay cross braces while filing the scarfed ends to fit the curvature of the tubes between which they fit. While these cross braces may be purchased ready formed at supply stores, the end scarfing is only approximate, it being impossible to keep in stock braces finished exactly to fit the many different styles of cranking used in rear forks and stays. Accordingly repairmen and other builders erecting machines in small lots are forced to file the ends of the cross braces by hand.

The curvature of the brace does not allow the piece to be held securely in the vise without clamping it so tight that the wall of the tube will be crushed or kinked.

The utility of the jig here shown is thus obvious. It consists simply of two square rods of iron hinged together at one end and provided with handles at the other, the completed tool having much the appearance of an ordinary nut cracker. Three sets of matching half holes are formed on the adjacent faces of the hinged parts, the notches forming when the tool is closed three holes, they being respectively slightly less than  $\frac{5}{8}$ ,  $\frac{3}{4}$  and  $\frac{7}{8}$ -inch in diameter, and so accommodating cross braces of these respective sizes. When it is desired to file out the ends of a brace, the piece is slipped between the arms of the holder and the latter brought together and held tightly by the handles. The holder is then placed in a vise and clamped securely. The workman may now file as much as he wants without danger of injuring the tubing. The tool will also be found convenient for making straight cross braces from scraps of tubing.

Ten years ago the United States was the fourth among the nations in the quantity of her exports; France, Germany and Great Britain being ahead of this country. In 1897 we had passed France and Germany, and our exports were but 26 per cent less than those of Great Britain. Now our exports of domestic merchandise exceed those of our Anglo-Saxon sister.

A French paper estimates that there has been an "overproduction" of 200,000 bicycles in Germany.

# Comfort

**T**HE comfort of a saddle depends largely upon intelligent construction in the earlier stages of the work. It is easy to make something and call it a saddle, but is it just as necessary to have a thorough *practical* knowledge of what constitutes a perfect saddle, before one can be made, as it is to have a thorough knowledge of cutting before a good and well fitting suit of clothes can be made. The lack of such knowledge results in botch-work, and we see lots of it, both in clothes and in saddles.

Neither of them will ever command the respectful consideration of those who know (and their name is legion) what constitutes good work, and the makers of them are soon relegated to oblivion.

It is the strongest and most convincing evidence of the perfection in *style*, *durability*, and *comfort* of the saddles produced by this company, that their goods command the admiration of more than eighty per cent. of the riders of this country and a very large proportion of those of other countries. Write us for information and catalogues. We shall be happy to furnish either or both.

## NEW TWO-SPEED HUB

### Device for Enabling Riders to Use Very High Gears— Very Low Gears in Reserve

Nearly every cyclist of experience is willing to admit that a changeable-speed gear is a very desirable feature of a bicycle in theory; but the majority will not make the same concession in practice. Rather than weaken hub or hanger with an intricate mechanism which is exposed to special wear and which easily gets out of order under ordinary riding strains, they submit to the ordeal of driving a high gear under conditions of strong resistance or dismounting and leading their machine over hills too steep for their driving power or over sandy roads where the surface is too uncertain to permit them to balance their machines when progressing with slow and laborious rotation of the pedal shaft.

It is this feature of a yielding road surface as much as the actual resistance that makes high gears impracticable on sandy roads, as balancing under such circumstances depends largely on the rapid shifting of weight from one pedal to the other. The same is true for riding on snow.

Cyclists have also always objected to riding machines in which a clumsy appearance or a conspicuous variation in external design and attachments proclaimed the crudity of the manufacturer's ideas.

#### A Much Sought Improvement.

In the forms of changeable gear which have gained any popularity at all, it is noticeable that the objectionable features here referred to are less pronounced than in the hundreds of change-gear mechanisms which pass through the patent office in this and other countries, but never reach the test of manufacture on a commercial scale; and it seems a reasonable inference that the complete removal of these features would at once make the two-speed machine the standard pattern among bicycles, provided, of course, that the bicycles in which such a perfect change-gear mechanism was incorporated were also in other respects equal to the best and in accordance with accepted ideas. Acting upon this or similar thoughts which promise a high reward in case of complete success, a large number of constructors connected with the bicycle industry, and latterly with the motor vehicle industry as well, are continually devising improvements in changeable gears.

Nothing of conspicuous novelty has, however, resulted from these efforts during the last couple of years until 1898, when the American Waltham Mfg. Company of Waltham, Mass.—now absorbed in the Stanton Mfg. Company of Boston—arrived at a satisfactory completion of its practical trials of the mechanism shown in the accompanying illustration. As a result of these tests this mechanism has now been adopted as an optional feature in the company's bicycles. Being novel, simple and mostly concealed within a hub of ordinary contour, besides representing certain definite features of construction which have not before been adapted to the same purpose, this mechanism enlists the interest of cyclists and the cycle trade strongly to investigate its merits.

#### Similar to Compensating Gear.

The Stanton company's device is called the "Waltham Two-Speed Hub." It possesses the radically new feature that the gearing used in it is always in mesh. It is most briefly described as a differential gear in which one of the vertical bevel

gear pinions may be locked entirely. It operates as a compensating gear on a tricycle or motor vehicle, except that either one of the two speeds is applied to one wheel—the rear wheel of the bicycle—optionally, instead of to two wheels concurrently.

For those familiar with differential or compensating gears this explanation is perhaps sufficient to indicate the principle followed. While, however, a compensating gear is operated through ground friction of the wheel tires so that the speeds of the two wheels are automatically regulated in the correct relations to one another, it is with the Waltham Two-Speed Hub the rider who locks one pinion either to the frame or to the hub. There is no way of merely retarding one pinion in its rotation; and the two speeds are therefore necessarily as two to one, when all four pinions are of the same size.

Although it would be simple to produce a different speed relation by making the horizontal pinions larger than the vertical ones, and the change could be made without increasing the diameter of the hubs largely, the Stanton company has chosen the two to one relation as best adapted to the requirements of bicycle riders, believing that the great majority of cyclists will appreciate to have a gear of, say, 132 for all ordinary

In the illustration: Fig. 1 is the hub shell; Fig. 2 is the whole device minus the hub shell. In the first place it will be noticed that the spider A B C D is always one piece with the hub shell; this spider is the driving rod of the rear wheel; also the small bolts H and H are connected with the hub shell, so that the whole hub is locked together in all ordinary riding and absolutely no mechanism is working. It revolves upon the axle G precisely like the ordinary bicycle hub. For every one revolution of the rear sprocket wheel the whole rear wheel revolves once; it is in this condition when riding the high gear. Now to reduce the gear the bolt M is dropped, the trigger K comes in contact with it, which withdraws the bolts H and H, releasing the hub shell and holding the pinion O stationary. Under these conditions the sprocket wheel will have to revolve twice to revolve the spider A B C D—and consequently the rear wheel—once. Mechanically, the only change is this: In the high gear the whole of S is locked to the hub shell and travels with it. In the low gear the whole of S is locked to the frame and is held stationary. The whole device is enclosed in the rear hub so that dust will not interfere with its running.

#### The Speed Reduction.

For those not familiar with the old "Bronco" gear or any of the sun and planet gears in which one gear wheel is fixed, the motion by which the gear is reduced to one-half by fixing one pinion is perhaps most easily understood by imagining that one of the horizontal pinions is the driver and the pinion which is rigid with the sprocket wheel is the driven gear. It is then clear that the horizontal pinion revolving once on its own axis must travel once around the fixed pinion, which has the same number of teeth.

riding on level and smooth roads, provided they are enabled to change it immediately to a 66-gear when circumstances require it. A high gear of 100 and a low gear of fifty would, in the opinion of the writer, be preferable for all city cycling and is, of course, entirely within the scope of the manufacturers' plan. It is in fact one of the chief practical merits of the device that the rider can choose his high gear absolutely independent of the change gear mechanism by selecting the size of his sprocket wheels so as to produce the highest gear he wants. The mechanism then gives him in addition another gear of just one-half the speed which he chose as his maximum.

While doing this it carries the sprocket wheel pinion around with it once by its travel around the wheel axle, and once by its rotation on its own axle. The sprocket wheel pinion and the sprocket wheel must then turn twice around while the spider A B C D carrying the bicycle wheel with it completes one revolution. That the sprocket wheel in reality is the driver manifestly makes no difference in this motion.

The bolt for changing the gear is operated by means of a rod extending along the inner side of the left upper stay toward the seat cluster and terminating in a finger piece which may be easily reached by the rider in the saddle.

**T**HE rider of a National is always proud of his machine.

It's handsome and well made.

Like a good horse well groomed it adds to its owner's pleasure in simply being "all right."

The real satisfaction in the purchase of a National comes when the buyer finds that his first expenditure is his last. No repair charges or delays later to reduce his cash or spoil his pleasure.

One season on a National and he says—

*A National Rider Never Changes His Mount.*

Better join the procession.

## How does this help the Andrae Agents?

In our '98 catalogue we printed three pages of Andrae '97 winnings.

If we had printed (in nonpareil type) a list of Andrae '98 winnings in this year's catalogue it would be thicker by six pages.

Almost every one of these races was won on

## ...The **ANDRAE** Racer

by amateurs—who paid full price for their wheels.

The rider who won races on the Andrae in '97 and '98, will buy an Andrae in '99.

The people who saw the Andrae win more races than any other wheel will want an Andrae. These hundreds of winnings have created a demand for the Andrae—people are looking for the Andrae agency.

That's how they help the Andrae agent.

Our monthly paper free.

## A GREAT IMPROVEMENT IN CYCLE TUBING

Brass Lined By Special Dip Brazing Process—Claim to Absolutely Prevent Rust Outside of Tubes and Peeling Off of Enamel, also the Weakening of Cycle Frames Incidental to Rust Forming Within the Tubes.

Brass lined seamless and "Clincher" cycle tubing is the latest improvement added by The Wilmot & Hobbs Mfg. Co. to their already well known tubing for cycle frames, rear forks, rear stays, front forks, etc. By a special process an exceedingly thin layer of brass, some half of one-thousandth of an inch thick, is deposited on the inner wall of the tubing and the makers claim these advantages are gained:

Vapors and other moistures admitted into the tube during its assembling into cycle frames or at other times are prevented from forming a rust on the wall of the tube, and rusting through with its consequent danger to the rider's neck through breakage is completely done away with.

The sweating through of any dampness from the inside is also prevented and the outer coating of enamel is therefore preserved from cracking and peeling off.

A more perfectly brazed joint between the tubes and connections is also made possible with the brass lined tubing. This is found of special value in flush joint work, the brass lining being to the cycle manufacturers what the tinning of roof sheets, etc., is to the tinsmith.

The brass coating is not applied by an electro-plating process, but each piece of tubing is immersed in a crucible of molten brass for a certain length of time. By this method the desired density is obtained and all porosity of the metal eliminated. But so thin is the coating that no appreciable difference is made in the weight of a tube.

The Wilmot & Hobbs Mfg. Co. have been forced by the great demand for their brass lined "Clincher" tubing to add to their already extensive plant a new department. Here a large force of men are engaged day and night in immersing tubes for the market. Leading cycle manufacturers in great numbers have appreciated the good points of "Clincher" tubing with this brass lining and the extent of the mills affords an evidence of the volume of business done by the company. The makers of "Clincher" tubing will be pleased to show to their customers among the cycle manufacturers this process, believing that it would be a great benefit to them in dip brazing the joints in building their frames. The process of dip brazing having been carried by this company to a state of perfection far exceeding that in common use, undoubtedly many good points can be learned which will be of great benefit to the cycle manufacturer who is on the list of favored "Clincher" tubing customers. Many leading cycle manufacturers have already availed themselves of this privilege to great advantage to themselves.

Jobbers and dealers as well as the individual riders are insisting on having brass lined tubing, and this improvement, added to "Clincher" tubing, makes it still better adapted to the uses of the trade. In this connection The Wilmot & Hobbs Mfg. Co. submit the following copies of testimonials to the value of their tubing as a few among many that have been received:

I have ridden a — chainless bicycle during the season of 1898 and must say that I am delighted with it. At the beginning of the season I was one of the skeptics regarding a chainless wheel, and it was only from the fact that I desired to thoroughly test the Wilmot & Hobbs Mfg. Co.'s Swedoh,

spring steel, Clincher Tubing that I tried the chainless.

I have proven it to be a very durable wheel, and attribute that fact to your use of The Wilmot & Hobbs Mfg. Co.'s "Clincher tubing" and fork sides," which give great strength and rigidity to the frame and at the same time a pleasant sensation to the rider.

I have ridden during the past season a — bicycle, the frame of which is constructed throughout from The Wilmot & Hobbs Mfg. Co.'s "Clincher" tubing, No. 24 gauge, and consider it by far the most rigid and strongest tubing for bicycle frames ever made. I have ridden gutters and railroad ties and have had a number of collisions on the track in which other portions of the bicycle have suffered, but the frame today remains as good as ever.

To those who wish to combine speed with safety I would most certainly recommend "Clincher" tubing.

At the opening of the season of 1898 we had considerable call for machines built of your Patent "Clincher" 50 Per Cent Carbon "Swedoh" Spring Steel Tubing, Front Forks and Rear Stays, but as we had ordered Seamless for our entire output, we did not care to order "Clincher" Tubing, in as much as we had never made any tests of your tubing. However, orders kept coming in for machines calling for "Clincher" Tubing, and we finally decided to send for some pieces to test same. The result greatly surprised us.

We put this "Clincher" Tubing through all manner of tests and found it, when made into frames, without reinforcements, 43 per cent stronger than the Seamless frames made from same diameter and gauge of tubing and which had the reinforcements, and 93 per cent stronger than the same Seamless frames when the "Clincher" tubing frames were reinforced.

Being satisfied that this "Clincher" tubing was far superior to the Seamless, we ordered enough for several machines and put them on the road, giving them the hardest usage possible, and as they stood up all right we decided to order enough of your tubing for 500 machines, and before the close of the season we had orders for and sold 800 machines made of your "Clincher" Tubing, and are pleased to say we have not yet had a single complaint, although many of them have been ridden thousands of miles. We find this "Clincher" Tubing more accurate in size than the Seamless and the surface is so much smoother that we have had less work in finishing it for enameling.

We are satisfied with your tubing and consider it the best for bicycles and have given you our order for 1899. You are at liberty to use us as reference at any time.

### BAD SELLING METHODS

Rubber Houses Needing New Outlets for Trade Rushed Hastily Into the Making of Tires.

In the course of correspondence with a large mechanical rubber concern, once prominent as tire makers, a letter has come to the India Rubber World, saying: "It is unpleasant to be reminded of our former connection with the bicycle business and, as we have been out of it for a year and a half we think it would be best if you would try and forget that we were ever in it." This letter does not differ in tenor from some that have come from other rubber companies. Yet there has been no decline in cycling, and tires are just as essential to bicycles as they ever were. The demand for tires came into existence suddenly and on a very large scale, and their production belonged, by right, to the mechanical rubber trade. The manufacturers were in need of new outlets, business with some of them being dull, and they naturally seized upon the new demand as a means of improving their business. But more of them apparently found reason to regret their venture in tires than otherwise.

It is to be regretted that the past conduct of the tire business has not been

such as to yield more substantial returns to those engaged in it. A tithe of the amounts spent by some firms in making expensive demonstrations of their tires, would have afforded good dividends, instead of a deficit. But for such methods, the list of tire manufacturers still remaining in the field might now be longer.

Pertinent to the situation here is the fact that the tire industry in Europe, so far as can be learned, generally has been conducted at a profit, though the demand has been smaller than in America. But it remains to be shown that the manufacture abroad has been developed to a higher degree of perfection than here. The difference in financial returns, therefore, must be due to some other consideration than any growing out of the factory end. The trouble with our own manufacturers doubtless will be found to have been due to an unfortunate choice in selling methods.

### Protection for Light Tires.

James A. Murphy and Amos D. Rowe of Holyoke, Mass., have patented a tire cover for the protection of light single tube tires. It is held on the tire by inflation of the latter, being provided with wired edges of a diameter too small to

pass over the inflated tire. The design is shown in two slightly differing patterns in the accompanying illustrations.

### Vulcanizers for Amateurs.

James E. Bancroft of Toledo has obtained patent for a vulcanizer in which overheating of the heat-plate is prevented by an arrangement for introducing a given amount of fuel for each act of vulcanizing. The fuel is absorbed in an as-

bestos wick and the quantity is so calculated that when it is burned up the tire is vulcanized.

### Rawhide for Wood Rims.

Prepared rawhide as one of the components of laminated bicycle wheel rims is proposed as a valuable improvement by George Beacock of Brockville, Can., who has secured United States patent for his method. The object is to prevent break-

# CYCLE AGE ADVERTISERS

Vol. XXII. No. 23.

THE CYCLE AGE OFFICE.

April 6, 1899.

## CYCLE AGE . . . . . . FACILITIES

### Cycle Age Catalogue Department.

Its object is to supply the catalogues of advertisers to readers and save them the trouble of writing a number of letters to the various houses. Apply direct to the Cycle Age, stating specifically whose catalogues you require, and enclosing stamps to cover postage. The catalogues will be sent by return mail.

Advertisers will please note that it is to their interest to keep the Cycle Age supplied with the latest literature. A record is kept of the persons to whom catalogues are sent and is supplied to manufacturers from time to time.

### Cycle Age Foreign Department.

The foreign department is designed to supply advertisers with any and all information obtainable concerning all the markets of the world. A partial list of the features covered is here given:

Populations of towns; nationality; principal ports; steamship lines; customs tariffs; packing; freight rates; express rates; buying season; condition of roads; domestic manufactures; principal machines sold; bonded warehouses; leading importers; retail dealers; American machines handled.

Advertisers and subscribers are invited to make use of the information contained in this department. It covers the whole civilized world.

### Cycle Age Circular Department.

The circular department is designed to address mail matter to the trade. The service is confined strictly to advertisers and a fixed charge is made and never varied. The Cycle Age lists contain about 56,000 names, of which about 37,000 are American and 19,000 foreign.

They are divided into countries, states, towns, manufacturers, agencies, jobbers and repairmen, so that any particular class may be reached.

Details are furnished in pamphlet, The Cycle Age lists, which will be forwarded on application.

### Cycle Age Patent Department.

This has been organized for the purpose of supplying information relative to numbers, dates of issue and ownership of patents, of instituting searches for possible interferences and of rendering service to advertisers and subscribers who contemplate applications. The charges in all cases will be as low as is consistent with efficient handling of the business.

### Cycle Age Registration Department.

The U. S. government has officially recognized the Cycle Age register of names of bicycles, and the ownership of same. The list is under constant revision and will appear in the Cycle Age in the first

issues of January, April, July and October.

### Cycle Age Leases.

The Cycle Age lease has been adopted in all parts of the country and has never been successfully attacked.

A sample will be forwarded on application.

Annual subscribers to the Cycle Age are supplied with blank leases without charge.

### Cycle Age Small Want Ads.

This is designed to supply a medium for the insertion of such advertisements as situations and help wanted, sales of small articles, exchanges, etc., at a moderate charge.

The cost is 5 cents per word for the first insertion and 3 cents for each subsequent insertion.

### Foreign Buyers Like It.

Twiner & Pursehouse, Goulburn, N. S. Wales:

Allow us to congratulate you on the get-up and general excellence of your paper. It stands apart from all other cycle trade papers inasmuch as its contents repay perusal and the advertising pages are works of art from a printer's point of view.

Scott & Hoare, Melbourne, Australia:  
The Cycle Age is a fine production, unapproached by any in any other country.

## CYCLE AGE DID IT

Sold the Entire Output of One of Its Advertisers Who Now Doubles Capacity.

The following extraordinary letter has been forwarded, absolutely without solicitation, by George D. Wilcox, of the Bullis Ball Gear Co., Rochester, N. Y.:

Up to the present time we have used your paper exclusively as an advertising medium, and feel safe in saying that the large number of inquiries we have received not only from the United States and Canada, but from England, France, Germany, and Russia, have been due to your broad circulation. We are more than pleased with the results thus shown and will say that through the use of your paper alone we have been able to secure enough contracts for our gear to cover our entire production. We are at present doubling the capacity of our output, and we wish to take advantage of this opportunity to express our entire satisfaction with your most excellent paper.—George D. Wilcox, Bullis Ball Gear Company.

Well satisfied advertisers attest their pleasure with great regularity. Here is another of the latest samples received:

We have had good results from what advertising has been done in the Cycle Age and want to continue later on.—The Kelly Mfg. Co., Greentown, Ind.

## Send in Your Literature

The Cycle Age will be glad to receive from readers suggestions which may be made valuable to agents. Recently an agent's card, containing a bright idea, reached this office and was reproduced in Cycle Age. It has since been used by many repairmen in their local advertising. It is here reproduced for the benefit of those who may have overlooked it.

Others who have bright ideas in the form of literature of any kind—cards, pamphlets, local newspaper ads., etc., will confer a favor by forwarding samples to this office.

## BICYCLE REPAIR BARGAINS..

FOR 30 DAYS ONLY

Now is the time to get your bicycle put in good order for the season.

No. 1.—For \$1 I will send for your bicycle, clean, oil and adjust all the bearings.

No. 2.—For \$2 I will send for your bicycle, clean, oil and adjust all bearings, polish all nicked parts and brighten frame and forks.

No. 3.—For \$4.50 I will send for your bicycle, clean, oil, adjust, enamel the frame and fork black or maroon and polish nickel parts.

No. 4.—For \$6 I will send for your bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires if worth repairing, and polish nickel parts.

No. 5.—For \$8 I will send for bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires if worth repairing, nickel plate all parts except spokes and hubs.

No. 6.—For \$10 I will send for bicycle, clean, oil, adjust, enamel black or maroon, true both wheels, true frame, forks and cranks, repair tires as above, nickel all parts, put all new spokes in both wheels.

F. E. LOW

BICYCLE WORKS

221 MARKET ST.

age of the outer edges which retain detachable tires. In one form of the invention the rawhide strip is interposed flat between the laminae of wood as shown in one of the drawings. In the other form the edges of the rawhide are free and are rolled around wires, forming retaining edges that make special shapes for the wooden hoops unnecessary. The two shapes seem to be intended for the Dunlop and for the G. & J. patterns of tires, respectively.

The rawhide is prepared without destroying or removing the gelatine in the hide and hardened by applying thereto a solution of sulphide of sodium and after-

ward a solution of borax to toughen it. The hide is split to the thinness desired, dried in a stretched state, then saturated with benzine or naphtha, and finally waterproofed by applying a waterproofing liquid. The prepared rawhide is cut into strips of suitable width and shaped in a machine to suit the curvature in cross-section, and while being so formed the edges of the strip are turned inwardly or folded upon itself and a wire D placed in the fold, whereby the wire will be covered by the rawhide. The strip should be wide enough to allow the wired edges to stand upon but not project outside the rim, so that the wired edges will offer resistance to the pressure of the tire when on the rim and assist the wood rim to withstand rough usage and frictional wear.

#### Fastening for Detachable Tires.

A fastening method for wired detachable tires has been patented by Charles G. Page of Oak Park, Ill., which reminds of the Burwell system. It differs for use on either plain crescent rims or crescent rim with a single central rib along the bottom of its concavity. The fulcrums for

the contracting device are so arranged that the leverage applied to contracting the wires increases as the contraction progresses and the resistance becomes greater. The illustrations show how this is accomplished.

#### Two Sets of Sprocket Gears.

Henry M. Kolb and Charles Fochl of Philadelphia have patented a change-gear mechanism of which the principle consists in the use of a double set of sprocket wheels, either of which may be made inoperative by releasing the front sprocket from the crank on the same side

with it, so as to permit it to revolve as an idler. The hub of the sprocket is thus made to clutch or not clutch the collar upon the crank shaft which it encircles. By refraining from making the mechanism automatic, so as to release one sprocket by the same act which clutches the other, great simplicity of the working parts is gained.

#### ROAD CONTESTS IN NICE

Heavy Vehicles Make Twenty Miles an Hour—Mile in 1:36 on Boulevard—Many Contestants.

An important motor vehicle exhibition and series of speed contests on the road were held at Nice, Italy, during the last week of March. The first race was over a fifty-mile course and was divided into two classes, the first for vehicles weighing more than 400 pounds and having seating capacity for not less than four persons, and the second for motorcycles weighing less than 400 pounds. There were twenty-four starters in the first class and fifteen in the second. The start was made at 7 a. m.

Lemaitre, one of the oldest "chaffeurs" in France, won the motor vehicle race with a sixteen horse-power road wagon in 2:52:50, winning the first prize of \$800. Second prize winner was 26½ minutes later in finishing.

The race for motorcycles was won by Teste in 2:59:00, who finished 21½ minutes ahead of Rigal, the next man, winning first prize of \$300.

A tourist speed contest over a course of about fifty-three miles was also run. It was divided into five classes, as follows: Two-seated vehicles, four-seated vehicles, vehicles seating six or more persons, motorcycles weighing less than 200 pounds, and motorcycles weighing from 200 to 400 pounds.

The prize in the motorcycle race was won by Geo, who finished in 2:21:56. Madame Dhasty, in a double-seated victoria, surprised the spectators and other contestants by finishing first in the second class in 2:58:18. Mercedes won the contest for four-seated vehicles in 2:27:30, while Buisson covered the fifty-three miles with a six-passenger coach in 3:54:00.

On March 23 a mile race for motor vehicles was run on the Promenade des Anglais amid a large concourse of Nice's most fashionable people. Most of the starters in the road contests took part. Lemaitre outdistanced all competitors with his powerful vehicle with the greatest ease, and in the final match heat to decide the contest covered the mile with standing start in 1:36. The race was run in pairs in eight heats, four semi-finals, two second semi-finals and one final. Gireaud made second best showing and covered the mile in the final in 1:45 1-5. The motorcycle race run the same day and place was won by Becormais.

#### Installing Electric Cab Service.

The close of the present week will see fourteen electric automobiles in service in Philadelphia. Seven of these will be cabs, seating four persons each; three broughams, seating four each; two open carts or tally-hos, with seats for five, and two opera buses, each accommodating eight. Additional vehicles will be placed in service as fast as they can be turned out, and before summer horseless carriages will be so numerous there as to excite no comment.

#### Will Stick to Bicycle Making.

H. A. Lozier, Jr., asserts that the Lozier Manufacturing Company is not preparing to embark in the motor carriage business. He stated a day or so ago that the naphtha engine which the company is preparing to manufacture at its Toledo

factory is designed wholly for use on launches and can not be utilized on automobiles. While in France last month Mr. Lozier became greatly interested in the automobile sport, and on his return to this country he brought with him one of the latest patterns of the De Dion-Bouton vehicles. This, he says, was purchased wholly for his own amusement and no significance need be attached to the move. He says that his company will confine itself as heretofore to the manufacture of bicycles and adds that Mr. Lozier, Sr., is not interested in the development of the motor carriage.

#### TIRES OF ELECTRIC CABS

Batteries Give No Trouble, But the Satisfactory Tire Has Not Yet Been Found.

Speaking of the electric cab service in New York city G. H. Condict, the manager of the system, says in *Horseless Age*: It has been impossible to make accurate tests of the efficiencies of motors, batteries, gearing, bearings, etc., although such data are now being obtained. There is still much to be desired, and in future equipments most material improvements will be made.

Outside of the consideration of large weight in proportion to power delivered, the battery has been given excellent service. Up to the present time there has been practically no expense for maintenance, and the old-time troubles of buckling, short-circuiting, sulphating and disintegrating are as yet entirely absent.

The tire situation is at present the absorbing subject of our day thoughts and night dreams. Were the streets in this great metropolis paved in an up-to-date manner there would be comparatively little cause for anxiety on this score, but with the antiquated and despicable cobble the case is far different. Over twenty separate and distinct types of tires have been tried, or are to be tried, in the near future, and others will probably follow. Solid, single and double-tube, pneumatic, cushion, clincher, sectional, protected and unprotected have all had, or are to have, a trial. Their faults are many, their virtues few, and we are still on the search. We have heard of some eminent authorities in the motor-vehicle field who say that the solid is the only tire. They are rendering judgment without full knowledge of the facts, and from a purely local standpoint. They are evidently not acquainted with the streets of Manhattan. A very satisfactory arrangement for broughams is that of rear pneumatic and front solids.

The wheels also require most serious consideration. The severe strains unavoidable in crossing railroad tracks and other inequalities, and running up against curbstones, speedily put out of service even the most substantial constructions. Everything, from the light and airy bicycle-wheel construction to the dish-pan wheels now so familiar on our streets, has been tried, and still there are more to follow.

#### New Motor Vehicle Co. Formed.

The United States Automobile Company, of Pawtucket, R. I., has recently been incorporated with a capital of \$250,000 for the purpose of manufacturing electric motor carriages and appliances. The incorporators are Frank Mosberg of Providence, President; Julian A. Chase of Pawtucket, treasurer, and D. McNiven of Pawtucket, secretary. The company has taken quarters at 623 Atwells avenue, Providence.

A motorcycle valued at \$545 and a motor carriage worth \$2,000 were shipped to Berlin a fortnight ago.

# THE PASTIME AND SPORT

## The L. A. W. Touring Department

In the establishment of a department of touring information the L. A. W. shows a commendable purpose to go further than ever before in providing practical benefits to its members outside of its tour books, official organ and fight for good roads and wheelmen's rights. The Cyclists' Touring Club of England is far in advance of the League of American Wheelmen in special conveniences offered to members, though the latter has doubtless really done far more on the whole for cyclists through its good roads legislation and its battles in court and legislatures for wheelmen's rights as exemplified by such *magna chartae* of cycling as the recognition of bicycles as vehicles on the road and as baggage on the railways. The C. T. C., however, has secured more personal conveniences in the way of customs, privileges, hotel and repair shop advantages and the provision of touring aids in the form of sign posts at cross roads and even repair boxes set up along the highways. In the promotion of these special advantages to members, the C. T. C. books play a far more important part in their applications and influence than does our own weekly bulletin. Over there a hotel license or a repair shop appointment cuts much more figure than do our no less formal but much less effective L. A. W. endorsements. Now that good roads and wheelmen's rights have been accepted here at least as an undisputed principle, it would be well for the L. A. W. to keep pace with new conditions and look more directly to what the League member gets for his dollar in the line of its new committee's purpose and the C. T. C.'s excellent example.

## "Jimmy's" Intentions Are Serious

Arthur Zimmerman's occasional "nights out" with the newspaper boys are usually followed by broadcast press "jollies" of the proposed return of "The Great Zim" to the track. This spring, however, he is to make a serious trial to discover what there is left of the speed that once was in him. "Jimmy" needs the money and thinks he can get it "in the same old way." He is now in negotiation for his first appearance, which will be at Berkeley Oval on Decoration day.

"The Skeeter" has had his troubles of late years. His parting with Joe McDermott, the successful manager and trainer of his palmy days, was an undoubted misfortune. His luckless trip abroad several seasons ago and his disastrous trip to Mexico last spring, which terminated in the culmination of the ills that were doubtless in his system throughout his trip, are sad memories to him and his admirers. But now the breach with McDermott has been healed and his old manager and trainer is back of him. "Zim" is still young, not having reached 30 yet. There is no reason why he should not have most of his old strength left and a great chance that the old sprint can be redeveloped. No racing man has ever approached the speed of his final sprint, in which he has been timed frequently at :11 and :11 1-5 for the eighth, which the very best of modern sprinters have done in 12 seconds. Could the race be slow to the stretch he would be even now worth a good bet in the final rush. Perhaps he still has the "stay," and experience may give him the ability to follow fast pace to the last quarter and then not be found wanting in the scramble down the back

stretch, around the curve and up the home to the tape. And who even at this stage of the game would risk much against "Jimmy's" chances in a match race without pace and without time limit, as he declares all races should be run? It is safe to say the public has not forgotten the greatest cycle racing idol it ever had and that "Jimmy's" success would mean much to the racing game.

## Sprint Races to Be Revived

There promises to be a revival by promoters the coming season of attention to sprint racing. It is proposed to feature special races and big handicaps for large purses rather than the ultra-expensive paced races of last season, so financially disastrous to the promoters of middle distance racing and the backers of big pacing teams. The A. C. R. A. spent \$8,000 on its pilots last season, and though there were in the aggregate larger crowds in attendance than ever before the association quit the game considerably to the bad. The troubles of the National Track Association have been in course of financial adjustment all the winter and the combination of tracks backing that team has just succeeded in concluding the payment of "the freight" and being restored to good standing with the L. A. W. board.

Unless the manufacturers take up the game and bear the whole expense, which is unlikely, middle distance racing on a continued big scale cannot consistently be looked for. Whatever we have will probably be between practical "scratch" teams gathered for the occasion, and this is more possible than formerly in view of our large stock of pacing machines and the very general experience riders have acquired in the pacing game.

To be sure, motor pacing may solve the problem. Fournier created much interest with his motor cycles this winter, going a mile in 1:35 on an indoor California track. He now proposes to have his brother with him in his pace furnishing project and talks about the wind shields he will attach to the rear of his machines. Counterparts of his motor pacers can easily be imported from Paris if our manufacturers are unwilling to build them. But the general adoption of motor pacing is not near enough to cut much figure in the game yet or to divert promoters from a trial at the public's willingness to patronize big money sprint races. The success of the great Quill Club \$2,000 handicap, two years ago, and the \$500 handicap at the last National meet are well remembered, and it is reported that 30,000 people saw the recent Austral wheel \$3,000 handicap. At any rate the trial is to be made. Nate Salsbury will put up \$500 for a handicap at the opening of the metropolitan district season at Ambrose park on May 20. This will be followed by one for a similar sum at Washington on Decoration day, and Blaurock will open Manhattan Beach on June 17 with the great Atlantic handicap.

## The Trade and the Sport

It does not seem likely that the trade will be mixed up in the racing game as an advertising proposition the coming season to any greater extent than it was last year. The Sager gear people gathered in the paced sprint records with Major Taylor at Philadelphia late last autumn under adverse conditions and still

have the all-around colored rider under contract. At one time it looked as though there might be a battle of the gears on the track and rumors were afloat that Colonel Pope had signed or contemplated signing Bald, Cooper, Gardiner and other cracks as the nucleus for a world beating, bevel gear pushing aggregation; but it is stated on the authority of one high in the racing game and close to the colonel on this proposition that all such intentions have been positively abandoned by him. Mr. Spalding will probably be too busy promoting the bicycle combination to saddle his concern with the further responsibility of a racing team. At least it is known that no attempt has been made as yet to renew his contract with his star, Eddie Bald. Tom Cooper has just been added to McFarland and Stevens as a cycloidal sprocket turning advertisement for the Tribune, and it has become a case of "I and Stevie and Tom" now. The Orient makers will pursue their policy of sticking to middle distance racing and paced record endeavor.

## Century Courses to Be Established

Century road riding seems to some to possess elements of danger in the temptations it presents to weak-limbed and inexperienced riders, while others look upon it as too insignificant an accomplishment in these days of fine roads and perfected bicycles to be recognized at all, much less with the formality of "century bars" as a feat worthy of record. The Century Road Club, its promoter and protector, however, still thinks it worthy of recognition together with riding for road speed records, and so believing has very consistently added new restrictions and conditions that should enhance the validity of the chains of the wearers of the hundred-mile medals bearing the club's affixed stamp. "Century courses" are being laid out in various sections of the country, over which all centuries must be run and along which the riders must be checked at special points to secure for this performance official recognition. Courses over the Merrick road on Long Island and between Englewood and New Brunswick in New Jersey have been recently laid out and designated as official for riders in the metropolitan district.

A race meet was given in Marseilles March 19 notwithstanding the warning of suspension by the U. V. F., and the suspended riders Jacquelin and Deschamps competed. The meet was very largely attended. Jacquelin was badly defeated in both scratch races, starting his sprint too late. Deschamps was the hero of the day, defeating Verheyen and Reboul by two lengths in the first event. The tandem race was won splendidly by Jacquelin and Octavie, the latter a woman rider.

The outdoor racing season in England was opened March 19 by a six-hour amateur multicycle race at Herne Hill track, London. There were thirteen starters. The Haysom-Duddles team won the event, covering 122 miles 460 yards. Bishop brothers were second.

The royal family of England has bought nine bicycles to be used by the personnel of Balmoral castle.

The national wheelmen's organization of Germany now has 43,000 members, as against 35,000 a year ago.

**SANGUINE VIEWS OF GERLACH****HE SEES NO TROUBLE AHEAD**

**Believes Suspended Racing Men Will Weaken and League Will Control the Sport Alone.**

The new chairman of the racing board reached his office in Chicago last Thursday, but declined to make any positive statement when asked if the League would reinstate the "outlaws" without the payment of their fines; neither would he deny that such a course had been decided on by the board in regard to the suspended riders. He did say that each rider would receive separate action and that the board would be guided by common sense in the matter. He also said that he had not the slightest doubt that the resolution of the big racing men to stay out of the L. A. W. would be broken, but declined to discuss the question when shown letters and telegrams regarding the stand the riders would take. He doubted the reports that handicaps for small fortunes as purses were to be offered down east, and said this would have no effect on the final result.

**Encouraged by Eastern Trip.**

His trip through the east had been one of constant encouragement. He had found nothing to discourage him and was sure that there would be but one controlling body and that one the L. A. W. He intimated that only Manhattan Beach track would be controlled by the N. C. A. He anticipated no further success for the opposition but what it had already obtained.

The chairman returned to Chicago with all the books of the board and at once buried himself in work. He will shortly issue a statement, otherwise a bulletin, and claims that there will be consternation in the ranks of the N. C. A. when it comes out. He is assured of the support of the A. A. U., of which James Sullivan is secretary, and he says that the A. A. U. will blacklist all the riders connected with the opposition.

**Will Offer Inducements to Foreigners.**

Mr. Gerlach says that Boston will have no trouble about funds, and that the L. A. W. will have no lack of prominent riders to follow its National circuit. Inducements will be held out to the foreigners to come to this country and compete at the National meet at Boston and also at the International meet in Montreal. He does not believe that the letter which Eck displayed had anything to do with the "outlaws," and says that the track manager evidently believed that the suspended riders would be restored to good standing long before that time. He had no doubt himself that they would be. The chairman said that the Ravenswood track in Chicago had notified him that it would stand by the League, and that other tracks were being added to the list of certainties every day. The building of two new tracks in the city for the N. C. A. did not bother him at all as the future might all be changed by conditions.

**The Fight in New England.**

Springfield, Mass., April 3.—New England is at present the storm center in the struggle between the League of American Wheelmen and the National Cycling Association. Both organizations claim everything in sight. L. A. W. stock has gone up a trifle since McDuffee, Nat Butler and Waller returned to the mother wing. The last issue of Ellibtt's official organ claimed that the Springfield, Hartford and Bridgeport tracks asked for sanctions on this season's National Circuit of the L. A. W. The N. C. A., how-

ever, is generally considered stronger than the L. A. W. in all of these cities. The suspension of the Springfield track was hastily raised by the L. A. W. when announcement was made that overtures were being made to the Springfield Bicycle Club by the N. C. A. The bicycle club will decide this week whether it will reconsider its determination to abandon the famous Springfield tournaments. If the club does not care to risk the venture it is likely that a race meet will be held in Hampden Park under private auspices. The dates of September 12, 13 and 14 have been offered to Springfield by the N. C. A.

**ROOT-GREENBURG SURPRISE**

**League Workers Make a Sudden Flop and Become Identified With National Cycling Association.**

It comes in the nature of a big surprise to not only League members, but to the "outlaws" as well to learn that Charles P. Root, of Chicago, ex-League handicapper for Illinois, one-time champion of Mott and vice-president of the Chicago Cycling Club, and George G. Greenburg, auditor of the L. A. W. and chairman of the Illinois state racing board last year, have decided to cast their lots with the National Cycling Association and have burned the bridges behind them by accepting positions under the board of control of the latter organization.

Although the first announcement came out on April 1 it is no April fool joke that Greenburg has accepted the position of western member for the states of Ohio, Michigan, Indiana, Illinois, Wisconsin and Missouri, and that Root has been appointed handicapper for the district for the N. C. A. Root's sudden change is even more of a surprise than that of Greenburg because, while the latter has for a long time advocated the abandonment of racing control by the League, Root's vigorous letter to Batchelder declining to serve as western member of the board of control for the "outlaw" body is still fresh in mind. He explains that his change of front is due to subsequent events that have transpired in the conduct of League affairs and which are little to his liking. He is enthusiastic in behalf of the new organization and believes that he and Greenburg can swing the Chicago C. C. and many local cycling lights over to the support of the N. C. A. He says he can also influence one of the new tracks to be built in Chicago to the "outlaws" if he thinks it advisable, and altogether has taken a very long leap on the side of the fence that looks sunniest just now.

**Strange Affair at Fountain Ferry.**

The action of the Fountain Ferry track management is causing much agitation among the ranks of the N. C. A., who are unable to understand the justice of the L. A. W. racing board blacklisting eastern tracks for allowing suspended riders to train on them and then giving the Louisville track carte blanche to throw its gates open to the "outlaws" and League riders indiscriminately for training purposes. The fact that Fountain Ferry will not give race meets except under L. A. W. sanction does not in the least mitigate the offense for which many other and more prominent tracks have been fined and suspended.

Members of the L. A. W. in and around Bellefonte, Pa., have inaugurated a movement to secure special legislation for the central part of the state in the way of cycling paths along the most prominent thoroughfares, providing there is no enactment of a compulsory good roads law. The idea advanced is to secure state aid only in part toward defraying the expense of building the paths, and this only after a certain amount shall be raised in some other way yet to be determined.

**ANNUAL CONVENTION OF C. W. A.****POLITICS IN THE BACKGROUND**

**New Officers Cable to Secretary Sturmeay for Recognition of "Outlaws"—Rubenstein President.**

Toronto, April 1.—The annual meeting of the Canadian Wheelmen's Association was held yesterday in this city. There was no contest for the chief executive office, Louis Rubenstein, former vice-president, being elected by acclamation, and there was not the usual rivalry between the various cities over the Dominion meet, which was awarded to Brantford. There was only one contest of importance and that was for the vice presidency, between J. W. Prescott of Vancouver, B. C., and A. B. Rattray of Montreal, Que. As the new president of the Association is a Montreal man, there was a strong feeling that the next office should go to the west and Prescott was accordingly elected by a large majority. Fifty-seven clubs were represented by 170 delegates, and forty-one clubs voted by mail.

**Revision of Constitution.**

One of the most important matters passed on by the convention was the complete revision of the constitution and by-laws. The Association increased the annual fee for affiliated clubs from fifty cents to seventy-five cents, which includes subscription to the official organ. The compulsory fee has been abandoned.

In future the convention will last two days. The second day will be devoted to the question of the improvement of the roads and will be known as "Good Roads Day."

The report of Chairman Wilson of the transportation committee informed the members of a very satisfactory arrangement which had been effected with the United States authorities at Washington, whereby Canadian tourists who are members of the Association have the privilege of entering the United States with their bicycles free of duty for a period of four months. Exceptionally favorable rates have also been secured with a transatlantic steamship line for the benefit of the racing men and others from the old country desiring to attend the world's meet.

**Reports of Committees.**

The report of the chairman of the membership committee gave the present membership at about 8,000, a slight falling off from last year, but a substantial increase was shown in the cities of Toronto and Montreal.

The report of Chairman Howson of the roads and touring committee showed that the department had accomplished a great deal. The country roads have been almost completely provided with first-class signboards; beneficial contracts have been made with the best hotels in various localities; an elaborate guide book is being compiled and the gospel of "good roads" is being everywhere set forth.

The report of the rights and privileges committee dealt with the cycle path bill, which was last month introduced into the legislative assembly of this province. This bill was laid over till next session, owing to the desire of the attorney-general to finish the business of the assembly before Easter, but the government has promised to give the bill its support at the next session. This bill is based upon the law passed in the state of New York two years ago, as applied to Monroe county in the vicinity of Rochester.

Alderman Graham, chairman of the reception committee of the city council, extended the city's greeting to the wheelmen and invited them to a luncheon tendered by the civic authorities, at which

the delegates were welcomed by the mayor of the corporation, several of the aldermen and other distinguished citizens.

#### Must Have Prominent American Riders.

At the afternoon session the following resolution was moved by W. N. Irwin and seconded by T. A. E. World, for the purpose of evoking a discussion:

Resolved, That in view of the complicated and unusual condition of cycle racing in the United States, and in the interest of the international championship meet in Montreal, the C. W. A. hereby recommends to the I. C. A. that, pending the adjustment of the difficulties in a manner acceptable to the I. C. A., riders of the L. A. W. and N. C. A. be equally eligible to compete in races held under C. W. A. rules.

A letter was read from Mr. Sturmev, secretary of the I. C. A., in which he stated that the I. C. A. would recognize the body which wins, when it is quite clear that it has won, and that the I. C. A. thought it was an internal question which should be settled in the states. Subsequently the resolution was withdrawn and the matter was left to the new executive officers to deal with, who at a subsequent meeting discussed the relations between the N. C. A. and the L. A. W. and concluded that while the I. C. A. felt that it should preserve as much neutrality as possible, the success of the World's meet at Montreal could not be jeopardized and the presence of the fast riders now under N. C. A. jurisdiction would have to be secured.

#### Special Privileges for N. C. A. Riders.

As a result of the conference the executive committee passed a resolution requesting the International Cyclists' Association to require the L. A. W. to make good its claim that all professional riders in the United States will have returned to its standard on or before July 1; failing in this the C. W. A. requests the I. C. A. to grant equal privileges to the N. C. A. and L. A. W. riders in all bodies affiliated with the I. C. A. This resolution was cabled to Henry Sturmev at Paris, France, and will be read at the meeting of the I. C. A. which is at present in session there.

The effect of all this is that the C. W. A. intends to secure if possible all the best riders in the States for the World's meet and make the World's championships of the greatest international interest. If the L. A. W. cannot demonstrate that it controls the racing men before July 1, recognition of the N. C. A. by the I. C. A. is inevitable. The C. W. A. expects the largest deputation of foreign riders which has ever appeared in this country. The foreigners will sail on the steamer "Vancouver" from Liverpool July 20, which will give them about ten days in this country before the Montreal meet.

#### Starbuck Unplaced in Italy.

J. Frank Starbuck took part in a big race meet in Turin, Italy, March 19 and 20, but ran unplaced on both days, although he won his heat on the second day in the handicap race by seventy meters. Parly and Pontecchi also were unplaced. Singrossi won the scratch race the first day, in which the others "also ran," and Bixio finished second, followed by Ferrari and Eros. Singrossi and Dei won the tandem race. Prisini won the handicap event the second day.

#### Cyclists Take Part in Campaign.

The re-election of Carter Harrison as mayor of Chicago is partially due to the efforts of the cyclists, who have not failed to appreciate the favors he has shown them during the past two years. It was during his administration that the ordinance was passed making it compulsory for all vehicles to carry lights at night and that the sprinkling of streets

was first regulated with a view to the comfort of bicycle riders. The mayor was also instrumental in having the street railways lay grooved rails at the boulevard crossings to make them smoother and he also interested himself materially in the laying of cycle paths in sandy stretches of road both north and south of the city proper. For these reasons and because they, as citizens, approved of the mayor's conduct in office, a committee of 100 cyclists was organized on non-partisan lines to support the mayor for re-election and to influence other wheelmen to vote for him.

#### WALNE THE CHAMPION

##### Wins Mile Championship of Australia in Close Finish With Walker—Other Races.

Sydney, Feb. 25.—The League of South Australian Wheelmen held a two-days' meet February 11 and 18 at Adelaide. The first day the terrific heat—110 in the shade—prevented a large attendance, only about 2,000 people attending. The second day the attendance numbered 5,000. The principal events were a five-mile scratch, the one-mile professional championship of Australia, and the two-mile Adelaide wheel race for prizes aggregating \$750. W. C. Jackson brilliantly won the five-mile scratch from Bob Lewis, with Walne fourth. The latter was suspected of crooked riding and asked for an explanation, which was accepted.

The one-mile championship of Australia was run on the second day and was won by Walne by an inch in 2:12, after the most desperate race he has had in his life. Entering the straight he led by three lengths, but with a magnificent burst of speed Don Walker drew even just a few yards from the post, but Walne's final jump gave him the first of the Australian championships for 1898-9. Walker shares with Megron the name of being the fastest sprinter in Australia, but is very erratic. S. E. Gordon, the brilliant black rider, finished third.

The two-mile race was won by W. G. Symmonds from Aunger in 4:17.

#### Walthour Wins 12-Hour Race.

The six-day two-hours-a-day race run at Houston, Tex., last week by Jack Prince was won by Bob Walthour, who covered 245 miles 7 laps. There was a hard fight between Burt Repine and George Kraemer for second place, which was won by Repine in the final sprint.

#### NEWS IN BRIEF.

Harry Elkes has offered to engage Bob French as a pacemaker for the season and has even promised to take him to Europe with him. French did some very creditable pacemaking for Elkes last summer and Elkes has apparently kept it in mind.

Lord Beauchamp, newly appointed governor of New South Wales, is an ardent cyclist. Lord Hampden, the retiring governor, took to the bicycle while in office and gave the pastime a great fillip at the time, as the Australian society followed in his wake.

"Pop" Brewster's appointment as an official referee by the "outlaws" association was announced in the Saturday papers of Philadelphia, although he intimated that he had not as yet been officially notified of the honor thrust upon him and refused to state whether or not he would accept the appointment.

Charles Turville, the Philadelphia long-distance rider, is home from his trip to the Pacific slope with the "outlaws." He relates some tough experiences in connection with his trip, although he is at present in excellent condition. His brother Clem was forced to remain on the coast owing to a lack of funds.

Philadelphia's outdoor racing season was inaugurated, as usual, by the annual Good Friday five-mile handicap of the South End Wheelmen. The affair has heretofore been a road event, but, owing to the condition of the roads, it was decided on the Point

Breeze track this spring. There were nine entries of whom but six finished. The race was won by the limit man, Samuel Foster, 375 yards, who won out by 100 yards over J. Henry Smith, a 150-yard man, in 14:35.

It is announced that Floyd McFarland contemplates an attack on the mile record, and that the attempt will be made on the Woodside Park track, Philadelphia. As that track still retains its allegiance to the L. A. W. this report would seem to indicate that the tall Californian contemplated returning to the fold.

Russian and other European racing men have made such pretensions and such exorbitant demands that the Russian bicycle firms have agreed not to give their agents any money to pay to riders nor to themselves hire any riders without the consent of the house which formerly employed them. These resolutions went into effect January 9, to continue for three years.

President Metz of the Waltham Mfg. Co. has notified the Boston '99 Meet Club that it can draw on the makers of the Orient bicycles for \$500 as a portion of the entertainment fund to be expended during the League meet in Boston August 14 to 19. The club has established headquarters and secured the support of city and state officials.

By vote of the racing board the following have been appointed L. A. W. handicappers: Charles H. Norwood, of Paterson, for New Jersey; A. G. Powell, Philadelphia, for Pennsylvania; T. F. Myler, Pittsburg, for Pennsylvania; A. D. Smith, St. Paul, for Minnesota; George L. McCarthy, New York, for New York; J. F. Ollinger, Saline, for Kansas; J. C. Korlison, Boston, for Massachusetts, Connecticut and Rhode Island.

Mrs. John Rice, of Philadelphia, will come very near leading the lady riders of the country in the contest for the Century Road Club prize. Although Mrs. Rice refuses to make public the exact number of centuries she rode during the season of 1898 (her claim now being in the hands of the C. R. C. officials for adjudication,) it is known that she gathered in 52 hundreds in her last four months' riding.

The commissioners of the District of Columbia are alive to the benefits to be derived from the construction of a cycle path to connect Baltimore with the national capital and will do anything within their power to aid the project. They can grant the right of way, but are without authority to place any restrictions upon a free use of the path by non-members of the association. Through Maryland, however, the path will be for the exclusive use of the members of the associations building it, as the legislature of that state has practically assured the promoters that a law will be enacted making it a misdemeanor for others to ride upon it.

Little errors in the spelling of a rider's name oftentimes cause a permanent change in the name, regardless of the wishes of the rider himself. Some time ago McDuffee had articles drawn up for a race with Michael. His name was spelled McDuffie, and the rider so signed it, to save the trouble of changing it through the articles. This year the error was discovered by the press, which had generally accepted the wrong spelling, and the middle distancer became again McDuffee. The Swedish rider, Aronson, had his name spelled Aaronson when he entered for the six-day race this year. He himself does not know how the Aa came to be used.

Djakoff, the Russian, who, in 1897, won the N. C. U. 25-mile amateur championship at Wood Green, England, and afterward turned professional, has abandoned the racing path and opened a chemical factory near St. Petersburg. When racing he always meant business, and preferred to be alone, either cutting out a hard twenty-five miles an hour or sprinting time after time in the most insane manner, according to our views. He resented anybody hanging on to him, and his manner of jumping away from those who tried to do this was amusingly effective. As a matter of fact, it is doubted if any professional in England at that time could have held the Russian.

Southern California will have one and perhaps two representatives in the eastern circuit races this season. William Furman, a giant of 19 years, standing 6 feet 3 inches and weighing nearly 200 pounds, is one, and the other is Fritz Lacey, a nephew of Sir Arthur Sullivan, of England, the composer of "Pinafore." Furman was spoken of as a wonder by such riders as Bald, McFarland, Stevens, Eaton, Goodman and other eastern cracks when he rode in the Los Angeles races this winter. He is a strong sprinter and previous to taking to the track was the crack road rider of the coast and a member of the Bay City Wheelmen relay team. He turned professional during the recent indoor races at San Francisco and won money in the best company.

## RETAIL MISCELLANY

## General Information Concerning Cycle Agents and Repairmen Throughout the Country

**Alabama.**

The stock of pianos and bicycles of the Junger & Cass Co., Mobile, has been injured by water.

**Arizona.**

William Bowen will open a bicycle store in the Code-Salter building, Phoenix. He will carry a line of up-to-date machines and sporting goods and operate a repair shop.

**California.**

J. Leslie Hague has sold out his bicycle business in Escondido.

The Pasadena Cyclery, C. F. Hamlin, manager, has opened at the corner of Colorado street and Broadway, Pasadena. A complete repair shop will be run in connection with the business. A line of Victor and Featherstone models will be carried.

The Miller Cycle Co. of San Diego has gone into handsome new quarters at 1025 Fifth street. The rooms have been neatly refitted with a repair shop in the rear and when everything is in order the establishment will be one of the finest of its kind to be found anywhere. The Cleveland bicycle is the company's leader.

C. W. Burgess of San Bernardino, who for a number of years has been constructing and repairing oil burners for the Santa Fe company, has resigned his position and taken charge of the repair shop of the Columbia Cyclery, 433 Court street, same place.

Frank Wheeler of Long Beach has secured a gasoline engine and will attach it to a lathe in his bicycle shop. He contemplates building more room and adding other improvements to his shop.

The firm of Wright & Hill, Santa Ana, has dissolved partnership. H. C. Hill, however, will continue the retail bicycle business at the old stand and Mr. Wright will do the repairing in the shop in connection.

The San Diego Cycle & Arms Co. has filed articles of incorporation in the county clerk's office. The capital stock of the company is \$10,000.

C. E. Kocher has purchased the Trilby Cyclery and repair shop of Merced, formerly conducted by Wheeler & Davis and is now prepared to do all kinds of bicycle repairing.

**Canada.**

A. E. Shantz has leased a store at 59 King street, Brantford, Ont., and will open a bicycle showroom.

**Colorado.**

Charles Van Hoorebeke, a bicycle dealer in Grand Junction, has taken a partner. The firm is now Van Hoorebeke & Fluke.

**Connecticut.**

The new firm of Stockton & Goodyear will open a bicycle store in the building formerly occupied by A. Brassart at Naugatuck. The interior of the building has been remodeled to meet the requirements of the new business. The firm will carry several lines of bicycles and sundries and do all kinds of bicycle repairing.

Oscar Hagen will open the bicycle store in Meriden which was formerly conducted by Stow & Phillips. Mr. Hagen will do the bicycle work and repairing in the best possible manner.

**Delaware.**

The Pyle Cycle Co. have moved into a new store at the corner of Tenth and Orange streets, Wilmington. The store is 16 by 54 feet with a complete repair shop on the second floor 12 by 54 feet. Cleveland and Crescent models are the leading machines sold by this firm. There is a riding school attached 54 by 85 feet with a balcony 14 by 54 feet.

**Florida.**

W. T. May of De Funiak Springs has taken a partner and the new firm name is May & Cawthorn. They handle Crescent bicycles.

**Illinois.**

The bicycle room of John Ruppert of Paris is being remodeled and painted and when completed will afford a better opportunity to display new machines and sundries.

DeKalb has a new enterprise. F. L. Taylor has opened a general repair shop in the old Superior building.

George Decker has rented a store building in Sterling in which he expects to open a bicycle repair shop.

Charles A. Underwood has opened a bicycle repair shop in Beardstown. He is pre-

pared to do all kinds of repairing and expects to put in a fine line of bicycles and an assortment of supplies soon.

W. J. Wiley of the American Cycle Supply Co., Chicago, has retired from business.

H. B. Conyers will discontinue the jewelry and bicycle business in Chillicothe.

The firm of Stewart & Massie, Quincy, have dissolved by mutual consent. A. K. Stewart assumes all debts of the concern and will continue business at the old stand.

Andrew Wier has opened a bicycle repair shop in the Barr building, Braidwood, and is ready to do all kinds of bicycle repairing and cleaning.

Samuel P. Allen of Fall River has taken a partner in the hardware and bicycle business. The new firm is Allen & Reber.

**Indiana.**

A. C. Katt of Fort Wayne is a veteran bicycle dealer, having been in the business since 1887. After a four months' trip through Indiana for the Gormully & Jeffery Mfg. Co., he has opened a new store at 84 Clinton street, occupying the entire two-story building. He has a nicely furnished salesroom and bicycle livery on the lower floor and a well equipped repair shop on the second floor. Ramblers and Ideals are still his leaders, as they have been for the past ten years.

John S. Sharp, of the firm of Johanboeck & Sharp, Charlestown, is dead.

Stewart Bros of Marion have made arrangements for the erection of an addition to their bicycle salesroom on Third street. It will be used as their repair shop for the coming season and will be equipped with machinery for making all kinds of repairs.

M. C. Henley will open a bicycle store in Richmond. William Bell will be in charge.

J. W. Deitsch succeeds W. W. Briggs in the hardware and bicycle business at Geneva.

Simon J. Carroll has rented the building at 419 Market street, Logansport, and will place a stock of buggies and bicycles therein about April 15. This will not interfere with his regular business in Royal Center, but he is branching out on a larger scale. Bryce Burton will have charge of the Logansport establishment.

Priest & Hart of Bainbridge have sold out their hardware and bicycle business to Collier & Huffman.

Bennett & Bennett have dissolved partnership in the bicycle business at Richmond and John M. Bennett will continue the business.

**Iowa.**

O. L. Sturtevant & Son of Ogden have gone out of business. Bicycles were sold in their general store.

Nelson & Vooches, hardware, harness and bicycle dealers at Marble Rock, have dissolved partnership.

Bert Cotant has opened a bicycle repair shop and salesroom in New Hampton.

Mr. Stephens of Sioux City has taken charge of R. G. Fritz's second-hand store. In connection, Mr. Stephens will put in a complete outfit of tools for repairing bicycles and guns.

**Kansas.**

W. S. Daniels has leased his bicycle repair business at Newton.

W. J. Keyes who was in the bicycle business in Hutchinson last season is now in the bicycle department of the Hutchinson Hardware Co.

M. C. Kepple, a dealer in machinery and bicycles in Yates Centre, has sold out.

**Maine.**

Horace G. Larrabee will soon open a store for the sale of bicycles and their furnishings in Bridgton.

A. P. Blaisdell and J. A. Johnston, who recently bought out the work shop connected with the establishment of J. P. Wise & Son in Rockland, are now settled in their new quarters, where they do bicycle repairing in connection with other lines of work.

**Massachusetts.**

Barker & Belden, hardware and sporting goods dealers, 126 and 128 North street, Pittsfield, are to dissolve partnership and Mr. Barker will resign from the hardware part of the business. The new firm will be called the Hardware Supply Co. and will not handle bicycles. Mr. Barker will retain an office at 128 North street as manufac-

turers' agent for bicycles and specialties. Maxwell Eisner will continue to run the Barker & Belden bicycle repair shop at 128 North street.

Ernest B. Rines, bicycle dealer in Gardner since 1895, has been compelled to close out his business on account of poor collections, etc. He has lately filed a voluntary petition in bankruptcy. His liabilities are \$2,635.23 and there are no assets.

Whitten & Pollard have opened a bicycle establishment at 10 Andrew street, Lynn.

**Michigan.**

Fred A. Moore is opening a bicycle and repair shop in the Stewart building, Crosswell.

The Soo Cycle Co. of Sault Ste. Marie has sustained an estimated loss of \$400 by fire fully covered by insurance.

Joseph Sandburg is fitting up his new bicycle store on Main street, Menominee. He will have neat quarters.

Frank Allen has opened a bicycle repair shop in Sturgis.

Alderman Swiggert will open a bicycle repair shop in St. Joseph.

Sear & Lundy is the firm name under which a new business will be started in West Branch. A large stock of bicycles will be kept for sale and rent. A very complete repair shop will also be conducted, both members of the firm having had considerable experience in factories where bicycles are manufactured.

H. J. Richards will establish a bicycle livery and sundry store in Lapeer. He has the reputation of being a hustler.

Johnston & Recor, agents for Rambler, Crescent, Stearns and Crawford models at St. Clair, have dissolved.

It is reported that J. Heath, C. L. Barrett and J. P. Magna of Chicago are contemplating establishing a bicycle factory in Allegan.

Alex Ericson has reopened his repair shop at 114 Canda street, Ishpeming. He makes a specialty of bicycle work.

F. Cedar is reported to have opened a bicycle repair shop on Garfield avenue, Bay City.

**Minnesota.**

Carl M. Lund of Dawson has taken a partner in his tinning and bicycle business and the firm name is now C. M. Lund & Co.

Albert Gerde will open his hardware and bicycle store in Sacred Heart in about a week.

Bjarne Svensgaard, formerly of Winona, is now managing the B. R. Svensgaard Bicycle Co. at Fergus Falls. His brother, Harry Svensgaard, is traveling for the Excelsior Supply Co. of Chicago.

Liefer, Nichols & Co., incorporated, is the name of the firm which will succeed Nichols, Hornburg & Liefer in the hardware and bicycle business at Fairfax.

**Missouri.**

Sheets & Reeves, hardware and bicycle dealers of Blythedale, have sold out.

**New Jersey.**

Robert L. Thomas has moved his bicycle store and repair shop to 110 Church street, New Brunswick. He continues as the agent of the Lyndhurst and is also selling the Atlanta and White machines.

The Phillips Cycle Co. have discontinued business at Trenton.

**New York.**

The bicycle repair shop conducted by Post & Meacham at Le Roy was entered by burglars who carried away two bicycles and tools and sundries estimated at \$100.

Fred Burkhart and Fred Amann have opened a bicycle store and repair shop on Madison street, Syracuse.

C. R. Cook, an experienced machinist, has opened a bicycle repair shop in the basement of E. L. Heaton's jewelry store, Canton. He is also agent for Columbia and Hartford bicycles.

H. L. White and S. B. Pope of New Berlin have formed a partnership under the firm name of White & Pope, and will carry on a general hardware business and manufacture bicycles.

Tracy W. Nichols has sold out his bicycle business in Ballston Spa.

C. A. Ross, an expert bicycle builder from Syracuse, has opened a repair shop at 64 West Main street, Little Falls.

**North Carolina.**

J. O. Matthews & Brother will be succeeded in the bicycle repair business at Goldsboro by the Goldsboro Wheel Works.

F. B. Jones of Reidsville has retired from the firm of Joe Lindsey & Co., and gone in business for himself in the Harris building. He will handle bicycles, sewing machines and sundries and do repairing.

**Ohio.**

The firm of Ott & Hemley, doing business at 606 Monroe street, Toledo, has been dis-

solved by mutual consent, E. W. Ott retiring and D. A. Hemley continuing the business under the name of the Lucas Bicycle Mfg. Co.

M. L. Lasley, who has been located in Warren for nearly two years, will move to Baltimore where he will engage in the bicycle business.

The Raymond Cycle store, 910 Jefferson street, Toledo, has been entered by thieves. Two overcoats and a number of fittings were taken.

J. G. Mahr, a bicycle repairer in Toledo, has been burned out.

Renner & Nichodemus have dissolved partnership. They were hardware and bicycle dealers in Scott.

A gasoline explosion in the bicycle shop of J. G. Maher, Toledo, caused a loss of about \$600.

Charles Brown is opening his bicycle repair shop on South Second street, Gallipolis.

W. A. Simmons of Jefferson has sold his interest in the restaurant and bicycle shop to his partner, J. B. Clark, who will conduct the business.

E. W. Randolph, formerly of the firm of Newman & Randolph, mechanics, of Conneaut, has gone to Ashtabula to work for W. B. Stewart in the repair department of Stewart's bicycle store.

**Oregon.**

Articles of incorporation of the Crescent Cycle Co. have been filed in the county clerk's office, Portland. The incorporators are John Gebbie, W. J. Makelim, George J. Cameron; capital stock \$1,000.

**Pennsylvania.**

J. Kehoe has opened a bicycle store in Conshohocken.

John U. Longaker of Lansdale has reopened his bicycle shop in the basement of the Koffel building.

**Rhode Island.**

Andrew Budlong is contemplating an addition to his bicycle repair shop in Manville.

**Texas.**

N. N. Nunn & Co. have sold out their bicycle business at Bonham.

The Gorman Mercantile Co. is the name of a new firm which will succeed C. H.

Fee & Co. in the hardware and bicycle business at Gorman and Cisco.

**Wisconsin.**

Kaukauna has a full fledged repair shop. It is located on Wisconsin avenue and is conducted by A. Beucus & Co.

H. Kanaska of Milwaukee has been in Oconomowoc making arrangements for the opening of a bicycle and sporting goods establishment in the near future.

J. E. Garvin will open a bicycle shop in Loyal as soon as he can get a building.

Mr. Lee, a jeweler and bicycle dealer and repairer of Hebron, Ill., will be located in Footville the coming season. He favors the Monarch bicycle.

**Tire Company a Victim of Forgery.**

J. E. Keener was held to the criminal court in Chicago last Saturday under \$1,000 bonds to answer to the charge of forgery preferred by the New Brunswick Tire Company, 235 Lake street, which accuses Keener of buying a large number of bicycle tires from it and giving in payment a check for \$500, purported to be made by A. E. Bent, a responsible merchant of Chariton, Iowa, which has turned out to be a forgery. Keener claims the check came from one Charles Wanick, who has disappeared, and that he was imposed upon.

**Dealers Cautioned Against Swindler.**

A party representing himself as I. C. Warner and as a traveler for the Warner Bros. Corset Co. of Chicago, has been going through different cities and towns selling a paint for buggies and bicycles and giving his customers an order for either a Columbia, Rambler or Syracuse bicycle. He explains that the premium is in order to introduce the paint which he delivers and for which he collects. The bicycle never puts in its appearance, however, it is reported. Giles Bros. of Quincy, Ill., investigated the matter and claim to have found that neither Warher

Bros. nor any of the bicycle companies mentioned knew anything concerning the man. The Quincy dealer wishes that cycle dealers would be on the lookout for Mr. Warner, who is about forty-five years old, heavy set, sports a 2 karat diamond and is a smooth talker.

**Importance of Weather Conditions.**

Southern bicycle dealers will be interested in the climatological statistics for 1898 presented in the appended table. A few choice deductions are made therefrom by the Abbott Cycle Co., of New Orleans. Rain means mud, and mud means bad bicycle business. Last year southern dealers had rain, mud, war and quarantine to contend with; ergo, if last season did not ruin dealers, this year should make them rich, for it is an axiom among southern meteorological sharps that a bad year is followed by a good one, and added to this the war and quarantine are eliminated.

A German company has been formed with \$40,000 capital to manufacture chainless bicycles.

# LAWSUIT NOTICE

WE HAVE COMMENCED suit in the United States Circuit Court against H. Grinberg & Co., and the Manhattan Storage Co., of Philadelphia, for infringement of our rights under the Duryea patent, in selling and offering for sale a compound for pneumatic tires.

Our attorneys will press same with all possible expedition to obtain an early adjudication of our rights. We have every confidence that our patent will be fully sustained and are prepared, if necessary, to carry the matter to the court of the last resort.

In the meantime we shall strictly insist upon our rights being respected.

## NEVERLEAK

is the only Tire Compound that can be legally used or sold. In handling it you have the positive assurance that it is the standard, the best, the only one used and recognized by Tire Makers and the only one you can buy, use or sell without buying a lawsuit.

We are daily asked to license others under our patent. We grant no licenses under any circumstances or consideration.

### OUR 1899 BRAND

Will close punctures fully three times as large as formerly, making it marvelously effective. It will preserve the tire, and overcome all the troubles.

**BUFFALO SPECIALTY MFG. CO. BUFFALO N. Y.**

SOME people would say this was bad business—'TIS! Don't imitate this and tie up with an unsafe line.

# INFORMATION FOR BUYERS

## HISTORY OF BALL SEPARATORS.

Four years ago the American Waltham Company brought to the notice of the cycling world its three-ball bearing which formed the most distinguishing feature of the company's bicycle, the Waltham Comet. The three balls in the bearing were placed in a separator which kept them always 120 degrees apart. Since then minor details of the separator device have been somewhat changed, but the company has seen no reason to change the main principle which they were the first to advocate: that in a ball bearing the number of balls should be as small as possible, and that each ball should be prevented from rubbing against the balls next to it and hindering their free rolling motion. In a bearing filled up with balls the two balls on which the greatest pressure rests at any given time are in contact with other balls which also sustain a considerable pressure when there is a load on the machine and therefore oppose the rolling motion of the adjacent balls very effectively. The ball-separating device on the other hand is entirely relieved from weight and plays freely within the limits of the small clearance left between each ball and it. When therefore the load-carrying ball—or balls—in its rolling motion jostles against the edge of the separator there is practically no resistance to the ball's motion from this source, but the separator adjusts itself automatically by the slight impulses which it receives to stay clear of the balls. After motion is once started the contact of the balls with the ball races on which they roll maintains them at their given distance from each other, and then even the minute automatic impulses which serve to adjust the separator cease. The smaller the number of balls the less clearance will evidently be required between balls and separator to make action uniform and certain.

When the American Waltham company championed these ideas for bicycle bearings four years ago they were hardly accepted

as axiomatic truth by the trade at large, but the separator idea has grown popular by degrees in the interim. Several other bearings have been placed in the market in which separators were used and finally this year it has been placed before the public as an indispensable refinement advocated by companies which are no wise suspected of favoring "freak" ideas. The makers of the Waltham Comet who have been abiding their time, naturally point to this course of events as a brilliant vindication of their steadfast adherence to the three-ball bearing and suggest to the trade at large that the incident should predispose anybody very favorably to look into the merits of the company's bicycle patterns in general and their Waltham Two-Speed Hub, which is described on another page, in particular. The plant and business of the American Waltham Mfg. Company has recently been purchased by the Stanton Mfg. Company with offices at 95 Milk street, Boston. The Stanton company is a corporation capitalized at one million dollars. Information in regard to its finances, management, &c., can be obtained through any of the mercantile agencies. The company protects the Two-Speed gear as well as the Waltham Comet bicycle with a full year's guarantee. The following from the company's catalogue indicates its general policy: "There is only one grade and one price in the Waltham Comet bicycle. Taking no part in the frantic scramble to cheapen the cost of production, paying no attention to the thousand and one concerns advertising 'First class guaranteed bicycles,' at prices lower than the actual cost of first class equipments alone, we have not for a moment lost sight of the fact that the manufacture of a first class bicycle imperatively requires not only first class material, but the very best mechanical skill possible for money to command. Examine the Comet critically as you may, you will find that the foregoing policy has been followed to the letter. Throughout the

whole bicycle not a single stamping is used, all connections are of the very best drop forged steel, the cups and cones of the best tool steel in the market, the tubing of the highest grade possible to obtain, and the finish second to none in the world. We make no cheap wheels."

## BELL'S BICYCLE CANNON.

The alarm shown in the illustration herewith has been lately brought out by the Bell Novelty Co. of Warren, R. I. Its appearance is similar to that of a field cannon, and because of this and the distinctive

alarm sounded, it is termed a bicycle cannon by its makers and given the patriotic title Dewey's Mascot. The alarm is supported by a pair of arms the rear ends of which attach to the front fork sides underneath the crown. It is operated by a cord running to the handle bar. The weight is but five ounces and the company guarantees that it will attract attention where a bell of the ordinary ring would fail.

## BRIDGEPORT BRASS CO.'S SPECIALTIES.

The Bridgeport Brass Co. of Bridgeport, Conn., is winning trade on all three of its specialties, the Search-Light gas lamp, the wishbone lamp bracket and the Bridgeport bicycle lamp. The second named has been previously described and has already become a familiar article in sundries stores. The important feature of the pump is the non-collapsible expansion ring in the plunger which keeps the latter at all times in air tight contact with the inner wall of the pump cylinder. Its utility should be readily recognized by all who have experienced trouble in maintaining foot pumps in proper air forcing condition.

In the Search-Light gas lamp the water reservoir is below the carbide chamber, the water being fed upward through a wick. The flow of water and consequently the height of the flame is under perfect control, neither being affected by the vibration of the lamp. If through carelessness the wick is turned up too high and more than the correct amount of gas generated a safety tube conveys the excess gas to the flame where it is consumed. No bad odor or increase of gas pressure is caused. The locking device attaching the carbide holder and water tank to the lamp body enables the lamp to be separated without difficulty. The interior of the combustion chamber, on account of the ease with which the chamber can be taken from the lamp can at any time be cleaned in a few seconds. No special cartridges or mixtures of carbide are re-

quired, ordinary lamp carbide being used. This is put into the lamp in a piece of muslin and when the carbide has been exhausted the entire charge is removed intact. The cloth may be shaken out and used repeatedly.

## INCREASE OF CAPITAL STOCK.

The Beebe Mfg. Co. of Racine, Wis. has increased its capital stock to \$150,000 which is an advance of \$100,000 over the original capitalization. The added amount of stock

has been taken by W. T. Lewis and C. D. Sinclair, respectively president and vice-president of the Mitchell & Lewis Co. of Racine. Bright trade outlook and need for augmented facilities prompted the increase.

## EFFICIENT CYCLE POLICE.

Few cycle clubs there are which present a finer appearance on a run or know how to handle bicycles with more ease and ability than the bicycle police squad of Greater New York. This is partly due to the fact that the men are all of about one height, well built, and well drilled in the art of riding through city streets. With the incorporation of the city of Greater New York the range of the cycle police department was greatly augmented in the boroughs outside of Manhattan and it is expected that the efficiency of this department during the coming season will eclipse all former records. During 1898, in the borough of Manhattan alone, the cycle corps made 2,018 arrests, aided and assisted 349 persons, stopped 77 runaways, and caught 99 scorchers. The value of the cycle police is well shown by the small number of the last named offenders in '98 as compared with the 1,127 captured in 1897. The members of the cycle squad have for several seasons been riding Wolff-American bicycles and will continue to use the same make this season.

## DOREMUS BRAKE AND COASTER.

The mechanism of the Doremus coaster and brake manufactured by the Doremus Brake & Coaster Co., 409 Fifth avenue, New York city, consists of a simple locking device on the crank axle so constructed that a slight back pressure on the pedals actuates the brake, pressing the spoon against the tire of the rear wheel. The brake can be operated suddenly, as in cases of sudden danger, or can be applied lightly and gradually. Forward pedaling instantly releases the brake mechanism. The rider

can coast at will without removing his feet from the pedals. The mechanism works on ball bearings and does not bind or catch after the brake has been applied but instantly responds to forward pedaling when it is desired to discontinue the retarding effect of the brake spoon against the tire. The parts are so made that they can be applied to any bicycle by the ordinary repairer. The entire mechanism being at the hanger, should the driving chain break or jump from the sprockets, the rider can still apply the brake and maintain control of his machine.

## "ECONOMICAL" BRAZING FURNACE.

The Economical Brazing Furnace Co., 9 South Halsted street, Chicago, have, after much experimenting, perfected a furnace for immersion brazing and are now ready to install furnaces in bicycle factories. Much care has been taken to rid the furnace of objectionable minor features and the company guarantees it to give perfect satisfaction both from a standpoint of class of work produced and from one of economical working results. Strong points claimed for this furnace are long service of crucibles, saving in brass and spelter, securely brazed joints, non-injury to tubing and small amount of scale and superfluous spelter left on parts after dipping. An expert will be sent to any factory to install furnaces, put them in working order and instruct employes in all details regarding the operation and general management of the brazing plant.

## UNIQUE RACYLE ADVERTISING.

The Miami Cycle Mfg. Co. of Middletown, O. has long been credited with marked originality in its advertising methods. The latest of the firm's distinctive advertising productions is a circular being sent to agents and displaying in a most graphical manner the virtues of the Racycle crank

hanger. The folder contains but little reading matter but the construction of the hanger is shown in pictorial representation stronger than words. The folder when unopened shows on its back an exterior view of the hanger. By turning back the two flaps of the back cover a partial sectional view of the inner construction of the bracket is displayed and by opening out the two inner flaps a complete sectional view is presented.

**FORSYTH DETACHABLE BRAKE.**

The latest pattern of brake spoon used with the Forsyth detachable hand brake, manufactured by the Forsyth Mfg. Co. of Buffalo, N. Y., is shown in the accompanying illustration. A solid molded rubber pad projects through a long opening in each side

of the spoon, the pair being held in place by a flat plate removably attached to the back of the spoon. The pads are so shaped that they catch ahold of the tire at the most effective braking points. The Forsyth brake combines the usual hand lever, the necessary adjusting plunger rod and a brake shoe which springs back from the tire by its own constant upward spring tendency after the hand lever has been released. The brake shoe is attached to the fork crown of the bicycle by means of an expansion plug which is pressed up into the lower open end of the fork stem. The spoon is connected to the plug by a taper bolt so that by turning up the nut the plug is expanded and becomes securely attached to the fork stem. Where there is no opening into the fork stem from below an ordinary machine screw is sometimes used for attaching the spoon to the crown. The operating lever attaches to the handle bar by means of a two part clamp which may be readily removed from the bars without disturbing the grips. When a large enough order is placed the company will form spoon and attaching parts to fit perfectly the style of forks for which the brakes ordered are intended.

**STALL INSTITUTES NEW METHODS.**

The Middletown Bell Co. of Middletown, Conn., under the management of President W. W. Stall, has inaugurated a plan of campaign which enables it to compete very successfully in the trade. Originally the factory was fitted for manufacturing thirty-six styles and sizes of bells, but under the present regime this line has been reduced to only one style and two sizes. By this method the goods can be turned out in great quantities and at comparatively less cost. Included in the plan is the scheme of making the goods of highest possible grade and selling them at a minimum price.

Mr. Stall is well known as the originator and manufacturer of "Boston Laminated" wood rims, and has made a reputation for his goods which stands premier the world over. The results of the Middletown Bell Co.'s new methods under his management will be watched with interest.

**NON-SLIPPING DREADNOUGHT TIRES.**

One of the strong advantages claimed for the Dreadnought tire by the Dreadnought Tire Co., 253 Broadway, New York city, in

addition to its puncture resisting qualities is that on account of the bead running around the center of the tread, side slip possibilities are reduced to a minimum. In making a turn the bead and one edge of the flat tread touch the ground, giving two points of contact. The company has received many valuable testimonials from users of the tire who are satisfied that the flexible wood band in the tread is a sure preventive of punctures and that it does not lessen the speed of the tire. Attention

is called to the fact that the Dreadnought tire does not absorb obstacles at its point of contact with the ground as does the ordinary tire, but yields at its tread over an extended surface thus producing a comfortable and lively cushion effect.

**FIRE STIMULATES ENTERPRISE.**

As an example of enterprise unaffected by disaster, such as total destruction of manufacturing property, the energy displayed by the Kelly Handle Bar Co. of Cleveland since the burning of its plant March 24 is quite meritorious. The company's factory was completely ruined on a Friday morning and on the following Monday the die and tool makers of the concern were busily at work making the necessary tools to manufacture Kelly handle bars. Inside of a week the company expects to be able to fill orders. The Kells Saddle Co., which is controlled by the same parties and which also suffered an equal loss with the Kelly company, will be able to bring out Models 60 and 70 of its Kells saddle at about the same time that the first lot of Kelly bars are completed. No pains are being wasted by either concern to care for patrons and the halt in deliveries will be but a brief one.

**COMBINED PEDAL AND TOE CLIP.**

A patent was allowed last week on the pedal construction invented by Eugene Baker of Chicago and assigned to H. W. Gilbert, also of Chicago, which is shown in the drawing herewith. The invention is an improvement on an earlier design by the patentee. It combines toe clips with the pedal frame, the clip being of that type which grasp the soles of the shoe at the sides. Shelves are formed on the outer sides

of the frame arms and on these rest the extensions from the spring clamps which form at once the ends of the pedal and the clips for catching the sole of the rider's shoe. The pedal side plates have flanges along their sides which give the plates a channel shape and furnish foot rests. That the foot may not slip from the flanges they are roughened or corrugated. The nuts on the ends of the frame arms serve the dual purpose of securing the side plates to the frame and of tightening the spring clamps in the position to which they are adjusted to suit the width of the shoe.

**STEELECH BALL-BEARING SADDLE.**

The Steelech Ball-Bearing Bicycle Saddle Co., 449 West Boulevard, New York city, is producing a saddle made from steel which is a new departure in anatomical saddles. It is the invention of G. A. Leech, a physician, and is formed with a hollowed out top to fit what the inventor terms the "ball bearing seat" of the rider. It is claimed that in whatever position the rider may turn, the conformation of the saddle follows the conformation of the body. The back of the saddle is turned upward to prevent sliding back and the pommel is curved upward to prevent forward slipping. Each side of the saddle is turned down, forming a wing against which a leverage may be obtained in back pedaling. The light tempered steel forming the saddle top will be enameled in any color desired by the purchaser.

**NEW BRUNSWICK RARITAN TIRE.**

The new Raritan tire made by the New Brunswick Rubber Co. of New Brunswick, N. J., is proving a great success. It seems to fit the present condition of the tire trade excellently. People want a durable, service-

able tire at a reasonable price, and it is to supply this want that the Raritan tire is made. Its price is certainly a fair one, and it is built for plenty of hard use.

**FEATHERSTONE REAR FORK END.**

The accompanying illustration shows the construction of a rear fork end fitting recently patented by Anthony Jerome and assigned to A. Featherstone & Co., both of Chicago. The fitting comprises three pieces of metal, a flat fork to receive the rear wheel axle and two thimbles slipping over

projections from the fork, the thimbles being D shaped to take D rear forks and stays. Round studs from the flat plate engage holes in the thimbles and hold the latter in position. One of the thimbles has a slight swinging play, the inclosed projection from the plate being tapered. This allows the fitting to be used with any height frame, the angle being within certain limits universal.

**VIM TIRES AT REDUCED PRICES.**

The Boston Woven Hose & Rubber Co. of Boston, Mass., is selling off its entire stock of Vim tires manufactured before January 1, 1899, at reduced figures, and is thus offering some excellent bargains to those desiring first-class tires at moderate prices. All Vim tires of the new pattern and with the new marking on them have been made this year and are sold direct to the retail dealer. The policy of the last few years of carrying in stock a large number of sizes and styles of tires has been abandoned by the company, which is now making only the Vim road tire and the Cactus pattern, which two styles are carried in stock in 1 1/2, 1 3/8 and 1 3/4-inch sizes for 28-inch wheels. Other sizes will, however, be made to order.

**SELECTING EASTERN QUARTERS.**

Gerhard Aussem, who for the past three years has acted in the capacity of shipping clerk for A. D. Meiselbach, will take charge of the New York office and wareroom and have supervision over the eastern and foreign business of the firm. Mr. Meiselbach is now in New York selecting quarters for a general eastern and foreign office. Commodious show rooms will be a feature of the eastern branch and Mr. Meiselbach proposes to keep from 1,000 to 1,500 machines continually in stock in his warerooms in the east.

**PATENT ON MANSON FRAME DESIGN.**

Louis H. Manson of Chicago has secured letters patent on the three-crown frame

design here shown, which covers, in addition to the three-crown feature of construction, the use of forksides of "irregular octagonal form in cross-section, the inside face of each fork arm being considerably broader than any of the other faces of the fork sides."

**PATRIOTIC VIKING CATALOGUE.**

The Viking Mfg. Co. of Toledo has displayed more than common originality in the design and composition of the Viking bicy-

cle catalogue and has also aimed at the patriotic pride and spirit of the catalogue's readers by using the bottom portions of the pages of the brochure to give a complete synopsis of the recent Spanish-American war. This synopsis is well compiled and includes handsome illustrations of the most prominent men and events of the campaign. The lithographed cover shows representatives from the recently acquired possessions of the United States formed in a procession and mounted on Viking bicycles, and on the back cover are depicted as persons in shadowy outline the various states and countries that are willing and waiting to join the country in all parts of whose domain the Viking bicycle is well known. The catalogue contains full page illustrations of each of the company's models.

#### NON-BREAKING SPRING FOR LAMPS.

Letters patent have just been granted to John Kirschbaum of Waterbury, Conn., assignor to the Novelty Mfg. Co. of the same

place, on the spring device for bicycle lamps illustrated in the accompanying drawing. The object of the inventor is to furnish a spring support for lamps which shall be simple and inexpensive to produce, will permit ample but steady movement of the lamp without sudden jolts, and which shall be so constructed as to be practically unbreakable in ordinary use. The device consists of two small telescoping tubes enclosing a coiled compression spring. This is attached by any suitable means within the usual bracket, reaching diagonally from the upper outer angle of the parallelogram to the lower inner end as shown. Thus the weight of the lamp acts directly on the spring to compress it, so that the leverage on the coils and consequent danger of breakage is done away with.

#### MOTOR CARRIAGE EXPERIMENTING.

The Erie Cycle & Motor Carriage Co. of Anderson, Ind., is making arrangements for exhaustive experiments during the coming summer with its gasoline motor for carriages and wagons. That ready money with which to carry out these experiments may be obtained, the company is selling out at extremely low prices 600 bicycles of its latest pattern, the lot being the remaining stock of ready made-up machines. Over 3,000 bicycles of the same model have been made and sold and all are substantial road machines, fully guaranteed, with the exception of the tires, for one year.

#### IVER JOHNSON FORK CROWN PATENTED.

Design patent has been granted to Nils Berglund, assignor to Mary E. Johnson, of Fitchburg, Mass., executrix of Iver Johnson,

deceased, on the fork crown which is now a recognized feature of the best product of the Iver Johnson's Arms & Cycle Works of Fitchburg, Mass. The essential feature claimed consists of two vertical parallel

slides, oval in cross section, connected near their ends by two arched members of approximately the same curvature, with the upper ends of said straight sides projecting above the upper curved member, so as to form horizontal shoulders, together forming a double-arch crown with the ends of each of the arched members merging into the vertical sides.

#### READILY SEPARATED PEDAL.

The Perpetual pedal, manufactured by Edmonds & Metzger, 253 South Canal street, Chicago, is gaining friends rapidly on account of the ease with which it may be taken apart for inspection, cleaning, oiling or similar purposes. By unscrewing the barrel from the frame the outer end cone is exposed and may be removed without displacing the balls or affecting the adjustment of the bearings. The pin need not be taken from the crank. When the pedal is reassembled the bearing parts will have their same relative relation to each other as formerly and the adjustment will be perfect, providing it was correct in the first place. Oil retaining grooves are provided at the bearings that the pedal need be oiled but once throughout an entire riding season. The company states that the design of its pedals is not their only strong advantage, but that extreme care has been exerted in the making of the parts, especially in the hardening of the ball races.

#### SANGER HANDLE BAR PATENTED.

Letters patent were allowed last week on claims for an adjustable handle bar with expander locking device advanced by G. A. Rosenbauer and J. P. Schowalter, assignors to the Sanger Handle Bar & Plating Co. of

Milwaukee. The ends of the bar are raised and lowered by the operation of a central vertical worm screw meshing with the toothed extremities of the bar sections. When the worm screw is turned by a wrench applied to its hexagonal upper end the handle bar grips are altered in their position equally and in unison. The expander rod extends down through a central hole bored in the worm screw and is prevented from moving longitudinally in the stem by a collar and a pair of locking rings. In this way the expander may be loosened without it being necessary to tap the plug loose from the end of the stem after the rod has been unscrewed, as the rod in turning forces the plug free from the stem. The worm screw is maintained in place in the stem head by a threaded ring or collar resting against a shoulder in the head and kept from turning by a locking nut.

#### AMERICAN TRANSFERS ABROAD

The Decalcomania transfer ornaments made by the Meyercoord Co. of Chicago have not only attained widespread popularity in this country and proven to users that transfers do not have to be of European manufacture to possess merit, but they are now being placed in the European market in direct competition with the home made transfers of Germany. An idea of the success which will doubtless be met there can be gleaned from the following letter recently written to the Meyercoord Co. by the firm of Zeitschrift Gut Werkseug of an interior German city:

"We confirm our last and have received in the meantime your designs of transfers,

and must confess that they are really very beautiful and that it will pay to look into that business. If you can send us a lot of samples of these designs to forward to the bicycle concerns we are sure to do a good business, because the transfers they sell over here are not at all like yours and we feel that the highly finished, elegant work of yours will surely get us customers."

#### STRAUSS CYCLE FRAME FOR WOMEN.

The accompanying illustration shows the lines of a woman's frame recently produced by Matthew Strauss, 334 Genesee street, Buffalo, N. Y. It is styled the Model Venus and affords not only a graceful appearance but ample mounting and dismounting room and will accommodate long skirts as well as short riding habits. Particulars regarding the frame and the fittings from which it is built are given in the new catalogue of the firm. This is now being distributed to deal-

ers and repair men and is a more than commonly complete materials and sundries list.

#### FITTINGS FOR SOUTHERN BUYERS.

Henry Keidel & Co. of Baltimore, Md., have issued an exhaustive catalogue showing a large line of sundries, fittings, accessories and shop tools of all description. The firm does a good business among southern dealers, repairers, and builders and aims to keep in stock materials to meet all demands. It acts as southern sales agent for the following manufacturing concerns: Eagle Bicycle Mfg. Co., Morgan & Wright, N. H. Hill Brass Co., 20th Century Mfg. Co., Judson L. Thompson Co., Manhattan Brass Co., National Cement & Rubber Co., New Brunswick Rubber Co., Girard Wrench Mfg. Co. and the Fay Mfg. Co.

#### RUSHING WORK ON MACHINE TOOLS.

The Grant Machine Tool Works of Cleveland has commenced to run its factory twenty-two hours a day, that it may keep up with its orders for the modern machine tools manufactured. The company has recently issued a new catalogue containing illustrations and descriptions of its milling machines, semi-radial drills, hand lathes, special piston ring and cylinder head lathes, etc. New tools added to the firm's line are a 42-inch boring mill, 16-inch taper turning lathe and a special automatic worm gear cutter. The catalogue is neatly printed and intelligently compiled.

#### HAVELL LAMP DESIGNS PATENTED.

Two lamp design patents were last week allowed to George Havell of Newark, N. J., assignor to the Havell Mfg. Co., of the same place, on the designs herewith shown. The principal feature of the first design is a bell shaped fuel reservoir provided with a milled edge and a cup shaped bottom, the latter

having a convex side united to a horizontal cylindrical lamp body, one end of which is closed by a globular shell of slightly reduced diameter and the other end of which terminates in a flanged reflector surrounding the lens. At the top of the lamp body and in the same axial line with the fuel

chamber is a chimney. This design is suitable for either an oil or a gas lamp.

The second design comprises a lamp-body of hour-glass shape, the adjoining sections of which are substantially parabolic in cross-section and connected by a reduced neck, across which extends a support for a reflector, also parabolic in cross-section, which terminates in an outwardly spreading convex flange. Rising centrally from the upper part of the reflector is a cylindrical chimney surmounted by a dome-shaped cap. The upper part of the lamp-body terminates in a spherical dome surmounted by a cylindrical boss which supports an adjusting-screw. The bottom of the lamp body ends

in a cup having a bulging or convex face and somewhat smaller in diameter than the milled edge of the lower section of the body. A tube connects the lower portion of the lamp body with the reflector and about midway on the latter is a circular socket for a colored sidelight lens, as shown. This design is intended for an acetylene gas lamp and is now being offered as such in the market.

#### FOURTEEN MODELS OF ANDRAES.

The Andrae line as shown in the latest catalogue of the Julius Andrae & Sons Co. of Milwaukee is in keeping with the firm's customary policy of furnishing models for everyone and of filling as near as possible the needs of all of the various classes of bicycle riders. The single machine patterns range in price from \$30 to \$60. The company draws attention with pride to the design of its tandems which in general frame lines have remained unchanged for several years and which are today representative of one of the most popular styles of tandem construction throughout the country. Not only is the list of models a large one, but the range in options is quite liberal and indicative of the generous intention of the firm to attract patronage by giving its customers what is called for. The catalogue is complete, but concise and free from weak attempts at polished advertising talk, everything concerning the line being stated in a straightforward, businesslike manner. The chainless pattern shown is fitted with the Sager gear.

#### HAND AND FOOT ROLLER BRAKE.

The Davis roller brake manufactured by the Davis Mfg. Co. of Indianapolis has proven so successful a trade winner in both the foot and hand operated models that the company continues the manufacture of both patterns. The braking operation is the same in both, the roller in each instance being secured beneath a metal hood, against which it binds when the brake is applied. Both brakes attach to the front fork sides directly below the crown and the foot brake is provided with knurled extensions easily reached by the foot or feet of the rider.

#### ELGIN CO. TO PUSH PRODUCTION.

The Elgin Cycle Co. of Elgin, Ills., has decided to largely increase its bicycle business and with this end in view will, this spring, erect another large factory building 250x40 feet and three stories high to be used exclusively for this branch of business.

The company proposes to engage in the manufacture of bicycles on an extensive scale, and the new building, equipped with everything modern in the way of machinery, will afford the best of facilities. A large force of workmen will be employed.

Attention is called to an advertisement in the small advertisement columns of a gentleman who offers his services in connection

with the Paris exhibition. American houses without the necessary connection in Paris may address the advertiser with confidence in his ability to afford them adequate representation.

Catalogues of sundries are desired by the New York Cycle Agency, 15 Forbes street, Bombay, India.

#### A REPAIRMAN'S COMPLAINT

Wholesale Supply House Accused of Irregular Practices in Shipping Goods Ordered.

To the Editor:—Bicycle repairmen and makers should keep a sharp lookout for a certain wholesale cycle material house which advertises sundries, frame parts, etc., at a reasonable figure. This firm received a good share of my trade last year until they fleeced me out of about \$10, when I abandoned dealing with them. Every order they sent out would be short some articles valued for a few cents. When cautioned, they positively declared that the order was filled to the letter, when it was not.

The last order I sent them was in May and amounted to about \$15. The order called for one set of frame parts and other articles. In a few days a letter came stating the frame parts had been shipped and that the balance of goods were delayed as supply was exhausted; that they were daily awaiting shipment from the factories, and that same would reach me in a day or so. Two days after receiving their letter the box containing the frame parts, or rather a part of them, came, and upon opening the box I found the seat post mast tubing missing; and they had sent 7/8-inch forksides instead of one inch, and a nine-inch one-piece head for a 22-inch frame. The balance of the goods I never received, yet they declared firmly that same had been shipped. Though I made strenuous efforts to bring them to time, I never received the goods; neither did I receive my money.

A brother repairman in Lima, Ohio, was fleeced out of \$6.85 last year by this same dealer. This same firm is now again fresh in business for the season of 1899. They send out circulars monthly and I am in receipt of one, and on the first page of their bulletin are a few introductory remarks saying they wish to inform the general trade that their articles are up to date in both quality and quantity, and that they are ready to serve old customers, confessing in addition that though they made mistakes last year and regret it, yet they are ever ready to adjust all negligence, etc.

I have visited several repair shops throughout Ohio and have heard many complaints against these people.

Belle Center, O.

J. J. SHOULTS.

#### Blind to English Defects.

The English cycling press is as a rule very fond of pointing out alleged faults of American bicycles and the "decrease in the export of American machines to Australia." English writers never, however, point out the faults of English machines which certainly exist. Two of the highest grade English makes imported into Australia have nearly killed dozens of their riders through the breaking of the forks, while another English machine has a weakness for snapping right across the middle of the frame. The writer has seen at least half a dozen bicycles of this make break down in this manner. American machines are used very extensively throughout Australia and it is very seldom that the frames break in any way, although they are several pounds lighter than the English makes. Even the agents for the latter acknowledge that the frames of American makes are strong and reliable. The rough Australian roads soon find out the weak spots in a bicycle. Several of the English manufacturers are

now reinforcing the forks of their machines, while the Rover Cycle Company is making the crown solid to get over the difficulty.

#### How Choate Assists At Legislation.

Minneapolis, March 27.—The joke of the season in local cycling circles is on A. B. Choate, and to a misunderstanding of his motives is due the defeat of the Kline bill. This bill provided that the chairman of the board of supervisors of road districts might purchase road making machinery in certain cases instead of applying the cash at his disposal to work on the highways of his district.

Of course every member of the L. A. W. knows that Mr. Choate is a crank on matters pertaining to good roads. He is a member of the highway committee of that organization and has occupied that position for several years. Although he has always been advocating good roads this was his first experience at attempting to influence legislation. He left his law office in Minneapolis last Wednesday to put in a few licks for the proposed measure. The country solons listened to his arguments, looked him over, and decided that he must be a road machinery agent, one of the sort that has been described as going about the country ensnaring the poor farmers by inducing them to buy a lot of bogus machinery. This mistaken estimate of Mr. Choate caused the defeat of the bill.

#### Another Classic.

Room for the Easter bonnet editor of the Peoria Journal while he does stunts in praise of the improved bicycle!

The large sprockets will be the popular thing, and will be from 26 to 28 inches. Both of the front sprockets will be the average. If larger than the above number of inches they are apt to be sprung out of true proportion.

Some neither can for wits nor critics pass, as heavy mules are neither horse nor ass.

## MISCELLANEOUS.

Advertisements under this head 5 cents per word first insertion; 3 cents per word each insertion thereafter. Cash with order. Express orders, postoffice orders or stamps received.

### WANTED.

**WANTED**—Good, live man to sell Rusch bicycle saddles on commission to jobbers and manufacturers only. N. SCHRODER, 91 and 93 Thompson st., New York City.

**INDIA, BURMA, AND THE EAST**—Henderson & Co., Rangoon, English Watchmakers, Opticians, Cycle Engineers, Agents and Repairers, are prepared to correspond with responsible manufacturers and agents in novelties pertaining to any of the branches of trade above enumerated. Samples (where possible) and prices to be submitted. Splendid area for trade. Highest London and American references. Address HENDERSON & Co., 63 Phayre st., Rangoon, Burma, India. 12

**WANTED**—Bicycle repairer; must be first-class. Address, giving experience and wages wanted, B. care Cycle Age.

**SIDE LINE**—Salesmen in the bicycle and hardware trades wanted to sell standard bicycle sundry on commission. Quick seller and liberal commission. Samples carried in vest pocket. B. H. DIVINE, Utica, New York.

### FOR SALE.

**VULCANIZER**—New, quick, sure; mends four tires at one time; valve attachment; oil or gas burner. Shipped with material for 100 repairs on receipt of \$3.00. ALEXANDER & Co. 34th st. and 4th ave., Brooklyn, N. Y.

**FULL DIRECTIONS** for making plugging and patching cement from old tires. Mailed on receipt of 50c. ALEXANDER & Co. 34th st. and 4th ave., Brooklyn, N. Y.

**FOR SALE**—White hot blast brazer, Goodrich steam vulcanizer, Barnes combined circular saw. TWIN CITY CYCLE Co., La Salle, Ill.

**TO EXHIBITORS AT PARIS, 1900**  
 A gentleman who is thoroughly conversant with the European trade will undertake the entire management of cycle exhibits of American houses at the Paris exhibition. He can attend to all matters in connection with an exhibit, such as securing space, receiving and clearing samples through customs, fitting up stands, circulars in French and German, in fact anything which may be needed will receive best attention. If two or three firms or perhaps four or five, if of a kindred nature, want to go in together, will take them on and thus make it much cheaper for them. Will make a price of \$1000 for each firm for three or more firms, and will attend to all matters which may arise from start to finish. Will hire an assistant out of this and get the samples insured at my expense, but each exhibitor must pay the cost of freight to Paris (there will be no duty to be paid if you know how to make a proper declaration), the cost of setting up the samples, but the cost of fitting up the space will be divided pro rata among the firms showing. Refer, by permission, to the Cycle Age Co. Address GIB, care of Cycle Age.

VOL. XXII—No. 24.

CHICAGO, APRIL 13, 1899.

NEW SERIES No. 73.

## TRADE 100 PER CENT BETTER

### Philadelphia Dealers Pleased With March Business—Allowances on Second Hand Machines Reduced.

Philadelphia, April 10.—“Last month was the liveliest March in our entire business experience,” said a member of a local firm of retailers to a Cycle Age man last week. “It beat March of last year by slightly more than 100 per cent; and what makes us especially satisfied with the situation is the fact that the proportion of money paid in on our machines sold is three times what it was at this time a year ago. This can be explained in great measure by the low price at which first-class bicycles, and all others, in fact, are selling. When high-grade machines sold for \$75 few of our customers—not even excepting the wealthy ones—failed to take advantage of the time clause and pay in installments, large or small as the notion struck them. Now, with the ruling price of \$50, the rider who trades in his last year’s mount has such a small difference to pay that upwards of 60 per cent of our sales have been cash transactions.”

This optimistic view of the situation is shared in by every local retailer who has been interviewed. In one or two instances it was found that orders were so plentiful that some embarrassment had been experienced in filling them within a reasonable time. Furthermore, dealers generally seem to be of the opinion that this healthy boom bears all the earmarks of lasting well into the summer season.

#### Best Second Hand Machines Bring \$15.

There seems to be a great diversity of opinion among local dealers as to the allowances to be made this year for second-hand machines in exchange. In 1898 money was so scarce that many dealers, in order to effect sales, were forced to allow much more for second-hand bicycles than good business policy would seem to warrant. This year few of last year’s models bring more than \$15 when exchanged for new mounts, and in these few cases the machines and tires are in exceptionally good condition. In outright sales of second-hand mounts to dealers the average price is about \$10.

One dealer reported that a week ago thirty-two second-hand machines taken in exchange for new ones, and which had cost him an average of about \$12 apiece, had been disposed of in bulk, without repairs of any kind, for an average of about \$8.50 each. “On the face of it,” said he, “this would look like poor business; but I have figured it out that to put them into fit condition to retail at, say, an average of \$20 each, would have cost me very nearly as much, after adding cost of material and workmen’s wages, as I would get for them.”

The majority of local dealers seem to be satisfied with the net result of their second-hand exchange business last year, and, with the proportionately much lower prices given this year, look for even bet-

ter results during the present season. With a straight \$50 rate on new mounts the rider who is allowed more than \$15 on his old one must turn in a machine in extraordinarily fine condition. The dealer seems to be sure of his position, and will do business on his own terms or let the prospective customer go, perhaps only to return when he finds that he can do no better elsewhere.

#### Parts Makers Give Options.

It now appears that the financiers who are endeavoring to effect a consolidation of bicycle makers are intent also upon purchasing or controlling some of the large parts manufacturing plants, as well as the establishments producing tires, and other necessary articles of bicycle equipment. As the days go by the enormity of the undertaking is becoming more and more apparent to Mr. Spalding, and not unnaturally he has summoned to his aid conspicuous people in various branches of the cycle manufacturing industry who have made it plain that the letters first sent out soliciting options did not reach more than a small fraction of the people who would make desirable allies. The number of concerns which these expert counselors have succeeded in persuading to give options on their plants has augmented the importance of the whole project.

There are fourteen sets of accountants and appraisers at work in various parts of the country making estimates on different plants, and their reports must all be in by April 17.

#### Crowded With Sold Machines.

Cleveland, April 10.—Never in the history of the business have the stores in this city presented the appearance that they do at the present time. Nearly every establishment has long rows of machines marked “Sold,” but no deliveries are being made. One concern has nearly 125 machines on its floor waiting for the purchasers to take them out, while another has nearly 75. With new stock coming in every day and second-hand machines being traded in, floor space is at a premium in every establishment in town and one or two of them have even secured outside stock rooms. A glance over the machines sold in the various stores shows that high prices are ruling.

## CYCLE COMBINE CAN DO GOOD

### Western Dealers Hope it Will Force Down Transportation Rates—Trade Conditions in Utah.

Salt Lake City, April 8.—The continued bad weather which ushered in the spring has had a most depressing effect upon trade in the western states and although some sales are being made the business cannot be said to be satisfactory. Two weeks ago the outlook for a large business was most promising, but if the rain and snow continue for two weeks longer it will bring the season to that point where the weather becomes hot and sultry and cycling is robbed of its keenest delights.

In sections of the country where graded, hard roads are common and shady lanes and byways abound, wheeling is a pleasure the year around, but in the west the unsheltered dusty roads do not furnish an enticing prospect for the cyclist.

#### Heavy Burden of Freight and Express.

The dealers are still patiently suffering under the burden of exorbitant transportation charges. The movement to concentrate shipments and direct them via fast freight lines does not solve the problem for the dealers in this section, for they are between the devil and the deep sea. Crated bicycles from Chicago cost singly \$3.80 by freight and by some process of figuring, unexplainable, two machines cost about \$3 each. The average cost of a bicycle from Chicago to Salt Lake or Ogden or to Butte, Mont., by express is from \$4 to \$4.25. On shipment of eight machines by express from Chicago, received by a Salt Lake dealer last week, the charges were \$32. If the bicycle combine proves a reality and desires to do something for the agent it will see that this extortionate charge is abolished. Just why a carefully crated bicycle should be classed as “double first” is beyond the ken of the average person. There can be offered no excuse for risk of damage by the transportation companies for there are fewer claims for damages on bicycles in transit than on furniture, which takes a much lower rate. When bicycles listed at \$150 the charges were not so onerous, but on bicycles listing at \$40 almost 40 per cent of the dealer’s profit goes to the express companies.

#### Repairers Working in Unison.

The repairers of Salt Lake are trying to adopt a uniform system of charges for all repair work and a schedule embracing almost every sort of repair has been adopted. While there has been no effort made to enforce any fine or punishment for violation of or departure from this schedule it is believed that it will be, as a rule, lived up to. At any rate, it eliminates the annoyance of wondering what the “other fellows” are doing.

As a whole, the charges for all classes of repairs have been slightly advanced and dealers have agreed to hold to these

prices "as long as the rest do." Already some of the unprincipled little fellows have taken advantage of this schedule to underbid the legitimate repairers, but the evils of price cutting have been so self evident that the majority of the dealers feel inclined to live up to the new rates notwithstanding.

One noticeable feature of the new schedule is the advance in the price of repairs on single tube and on laced double-tube and tires to 50 cents. The uniform rate on all puncture repairs has heretofore been 25 cents, but this rate now applies to clincher and detachable tires only.

As soon as the new schedule of prices has been given a good trial it is proposed to make it more binding and repairers who continue to violate their agreement will be summarily dealt with. Jobbers will be requested to refuse to sell to them and makers of bicycles represented here will be asked to refuse to sell them supplies or parts at any price.

#### Decline in Renting.

A noteworthy feature of the trade this year is the small number of dealers who are renting bicycles. Rentals have been cut to so low a price that dealers feel that there is no money in the business and have, as a rule, discontinued the practice of renting altogether. Probably another reason for this is that because of the low price of new and second-hand bicycles, many former patrons of the renting agencies now feel that it is cheaper to buy than to rent.

#### SPRING DAYS BOOM TRADE

**Snow Melts Suddenly and Riders Swarm to Dealers and Repairmen—Everybody Cheerful.**

Minneapolis, April 10.—The bicycle business in this city is booming at present, and the dealers say they have never experienced anything like it. Last week opened very dull, the snow still lying on the ground in drifts, but in the middle of the week the cool spell came to an end and the snow disappeared like magic. Inquiries at the bicycle stores increased in direct ratio as the snow melted and now trade is rushing.

The riding season is fully a month behind that of last year, but still every dealer states that the interest is going to be greater. The sale of bicycles is not by any means confined to the cheaper grades; in fact, people appear to have learned that the best is most serviceable in bicycles as in everything else. No one in the trade is as rushed as the repairer. Any number of machines are coming in that need attention. It is noticeable that a great many of these are not brought in by the original owners, which is taken to indicate that during the winter private "swapping" has been going on. The estimated number of riders in Minneapolis last year was 35,000. It is anticipated that this number will be increased to fully 50,000 this year, and some hopeful spirits have said it will be nearer 70,000.

#### Will Fight Wood Rim Decision.

Milwaukee, April 10.—Under a decision recently rendered in the United States court in this city, anyone may make wood rims. The Indiana Novelty company, however, is not inclined to give up so easily and the decision will be tested in the United States court of appeals. The Indiana company has sued the Crocker Chair company of Sheboygan and the F. W. Smith company.

The wheelmen of Johannesburg, Transvaal, are taxed \$2.50 annually for each machine owned. The revenue thus derived is to be applied to the construction of roadways for cyclists.

## AUCTIONS THE MAIN FEATURE

### AUSTRALIAN AGENTS WORRIED

**Clearing English Stock at Sacrifice—Complain of Canadian Competition—Fork Breakages Common.**

Sydney, March 10.—Adelaide seems to be the only one of the Australian capitals in which cycle auctions can be held with successful financial results. On January 25 Alford & Company, auctioneers of that city, acting under instructions from the Austral Cycle Agency, sold sixty machines, a few second-hand bicycles being among the number. Of course, the prices realized were much lower than the retail prices, but nevertheless a profit was realized on the sale. The machines were all English of the best make and comprised the following: Raleighs, Humbers, Singers model de luxe and Coventry Cross. They were of 1898 production. The lowest price realized for any one machine was \$35 and the highest price \$81. The model de luxe ladies' machines sold for \$70 to \$81, and the Humber drop frame from \$59 to \$67.40. The Coventry Cross was knocked down at from \$47.40 to \$56.20. The sale was well attended.

#### Unprofitable Auctions at Melbourne.

The Austral Cycle Agency has also been holding frequent sales in Melbourne of late. It is said that it has hardly cleared enough out of the sales to pay the expense in connection therewith. This firm, which has every prominent racing man in Australia mounted on its machine, the Swift, has instructed the racing men to return the machines at once.

A Canadian company which is doing well in the country districts of New South Wales and Victoria allows its agents 25 per cent. on sales and gives them a machine to ride free. Country agents who held agencies for English bicycles are relinquishing them and handling the product of this American concern, as it pays them a great deal better to do so. The big agents for English machines are complaining bitterly. They cannot allow their country agents such a large percentage and think that 15 per cent., as allowed by them, is a very fair commission.

#### Home-Assembled Machines Defective.

A few riders of colonial machines built up of English parts have met with accidents lately in Melbourne, due to faulty construction and workmanship. The trouble in every instance was due to the fact that no reinforcements had been used to strengthen the front forks for two or three inches below where they were brazed in the crown pieces, the consequence being that the forks were not strong enough to bear the continual jarring and eventually snapped off close to the crown, fortunately without serious results. Such gross carelessness will speedily sound the death knell of the colonial machine. In the majority of cases the omission of proper reinforcements is simply courting disaster, and as the cost is small and the weight not worth considering there can be no excuse for not using them.

There can be no doubt that the machines built in the colonies will find a good home market if proper workmanship is put into them; but let the public get the impression that the assembled machine is faultily put together, and what now promises to become a thriving industry will quickly die a natural death.

#### Should Reinforce Fork Blades.

It would be advisable for all the American manufacturers to reinforce the forks of their machines. The writer, however, is not aware of a single instance in

which the forks, or in fact any part of the frame, of an American machine has broken down. Last year's product of a Canadian factory was very faultily constructed and earned a bad reputation in Sydney for going to pieces, yet the agents in all their advertisements always stated that their bicycles "never require repairs." The latest output of this factory, however, is a great improvement over last year's and is taking on very well.

#### American Product Sold As English.

Bennett & Wood, Limited, of Sydney, handle a machine called the Speedwell. They have it in several grades from \$67.40 up to \$110, and each grade is made for them by a different manufacturing company abroad. The lowest grade is built by the New Hudson Company, of England, while the highest grade was, until a month or so ago, manufactured by an American house and was in reality one of the latter's own patterns sold as a Speedwell. It is now said that Bennett & Wood have taken the manufacturing of the Speedwell out of the hands of the American firm and entrusted it to the Rover Cycle Co. of Coventry, England. An amusing part of the whole affair is the fact that they have been selling the high grade Speedwell as an English machine when it is in reality an American.

Bennett & Wood announce having sold 115 machines in January in New South Wales. This would be exceptionally brisk business for any other N. S. W. firm, but as it costs this firm a great deal to run its big establishment, the month of January was not so profitable as it would seem.

The traveler for an American machine visited several firms in Sydney a month or so ago to endeavor to fix up the agency for it in Sydney. Bennett & Wood assert that the machine was offered to them landed here in Sydney complete for \$20 a machine. They refused the offer, however.

#### Too Many Irons in the Fire.

Frank Grimley of Sydney advertises in an English cycling paper for the exclusive agency in Australia and New Zealand of cycles, accessories and materials, or to push their sale on manufacturers' account or to purchase outright. Grimley is at the present time stacked to the roof with bicycles of American makes and with accessories. February 10 he disposed of fifteen machines at auction, very poor prices being realized. He now evidently wants the agency for English goods as well as American.

A fair number of juvenile cycles are to be seen, more of American make than English. If an attractive pattern for juvenile riders could be put on the Australian market at, say \$30, it should take immensely.

When Sutton & Company of Melbourne first accepted the agency for the Mascotte they sold it for over \$100. Now they are disposing of it for \$62.40.

#### No Market for Motor Vehicles.

The Australian Cycle & Motor Company, Limited, is believed to be losing a lot of money and are not expected to last much longer. They closed their Sydney branch some time ago. They are doing very little business in Melbourne and it is expected that they will close down very soon. This is an English firm and the shareholders are all English. They handle the Humber and other English makes.

There is not a motor car in the whole of Australia, although there may possibly be about thirty motor triplets. The bulk of the motor triplets are Gladiators, and heavy, ungainly things they are. If motor cars and triplets are to be sent to Australia for sale, mechanics who can repair them when anything goes wrong will also need to be sent.

**FREEZE OUT IRRESPONSIBLES**

**STRINGENT MEASURES ADOPTED**

**Organized Repairmen Threaten to Boycott Dealers Selling Parts at Discount to Non-Members.**

Milwaukee, Wis., April 10.—If repairmen throughout the country were to follow in the footsteps of the lately organized Milwaukee Repairmen's Association the mushroom and irresponsible repairmen would be crushed out of existence and there would not be the least difficulty in maintaining prices. Every wholesale dealer in Milwaukee and every dealer in parts in the vicinity has entered into an agreement not to sell parts at wholesale prices to any person who is not a member of the association or who represents a member. A list of the members is to be furnished each dealer with the result that every repairman in the city will have to come into the association or else buy all his parts out of town.

**Severe Penalties for Cutting Prices.**

The dealers have been given to understand that a violation of the agreement by selling to outsiders will mean the loss of trade and a boycott. Having fixed the dealers in this way the association has provided a penalty of \$25 for violations of the rules and failure to observe and keep up to the price list. Failure to pay the fine means a forfeiture of membership and the benefits that go with it. After the payment of the fine if the unfortunate member does not break the rules for the rest of the season he stands to have \$20 refunded at the end of the season. It will cost \$5 to become a member of the association which now embraces ninety per cent of the repairmen in the city.

**Official Repair Charge List.**

The following price list has been adopted:

Putting new one-piece hanger in old wheel and enameling .....	\$12.00
Cutting down frame, flush joint, and enameling ..	6.00
Cutting down frame, lap joint and enameling ..	5.00
New rear fork or stay, each .....	2.00
New tube in frame, each joint .....	1.25
Changing and brazing on new sprocket ..	2.50
Brazing in new crankshaft .....	2.00
Brazing broken tube .....	1.50 to 2.50
Truing up frame .....	.75 to 1.50
Repairing handle bar post .....	.40
Repairing broken fork .....	1.00
Repairing broken fork tips .....	.50
Truing front fork .....	.50

**Nickel Plating.**

Crank set for one or 2-piece .....	.75
Cranks, old style, per pair .....	.50
Sprocket, front ..	.40
Sprocket, rear ..	.15

**DETAILS KEPT SECRET**

**No Definite Information Substantiates Rumors of Canadian Combine—Weather Delays Trade.**

Montreal, April 10.—The talk about a Canadian bicycle combine still continues and rumors are rife. The companies supposed to be in the deal, were noncommittal when approached.

From Hamilton, Ont., comes a story of another trust, in which are interested two of Hamilton's most prominent men, William Hendrie and Senator Sanford. Other names mentioned are W. D. Matthews and Senator Drummond of this city.

The weather in this part of the country is practically a month behind time, and the actual opening of the wheeling season is some distance off yet. Despite the inclement weather the trade is quite active and shipments of wheels ordered during the unusual boom during the fine weather of February have been received from the factories and are ready for immediate delivery.

It cannot be said that the chainless has reached any very noticeable stage in the bicycle business locally, as yet, although it has many admirers and the few dealers handling it state it is meeting with a fair success, but the chainless is an unknown quantity in Canada.

If it proves a success this season in the United States a demand may be looked for next year, a demand which will exist principally among the wealthier people, unless prices are reduced.

**Strike in India Tire Plant.**

The employes of the tire department of the India Rubber Company of Akron, O., struck last week because of a reduction of wages paid to the girls. The reduction amounted to about 45 cents a day and the girls went out in a body and a general strike ensued. The men's wages were evidently reduced also as they claim the amount paid them for making tires was cut from 23 cents to 18 cents, and that they cannot make living wages at that price. A complete tie-up is threatened. The rubber workers are well organized and determined. The company officials say they will not restore the wages. All those who joined in the strike have been discharged.

**Outing Manufacturing Co. Successors.**

The Hay & Willits Manufacturing Company of Indianapolis, Ind., has been succeeded by the Outing Manufacturing Company of which George H. Evans is proprietor. Since the failure of the old company the creditors' claims were bought up by Mrs. Margaret C. Evans, a mortgage creditor. Merchandise obligations contracted to date are to be paid by the old company.

In many streets of Vienna wheelmen are not allowed to ride.

**JOBBER COMPLAIN OF CHECKS**

**OBJECT TO PAYING EXCHANGE**

**Ask Dealers to Purchase Drafts Instead But One Suggests That Banks Are Blamable.**

An association of jobbers located in Iowa and Nebraska, with headquarters at Dubuque, has issued the following circular upon the question of making remittances by check:

As an illustration of the increased expense attending the use of personal checks, over bank drafts, a public list of rates of exchange issued by a certain bank is cited: Charges for drafts to regular customers, 5 cents each; charges for remitting for personal check, 25 cents per \$100, or fraction of \$100.

A customer of this bank can buy a draft for \$110 at a cost of 5 cents for exchange. If he should send his creditor his check on this same bank, it would cost 50 cents, besides loss of interest for about ten days, postage, stationery and labor, which would add about 15 cents more. Every cent of this expense is forced upon the creditor contrary to the contract and is an invasion of his rights. Banks of the class mentioned have been known to advise their customers to forward their checks instead of buying drafts, and to refuse to purchase goods of any house that objects. The reason is obvious. Fortunately for the good of the business community such banks are comparatively few in number and have but little if any influence.

**Collection Bills Are Large.**

Some banks remit for checks drawn upon them and make a nominal charge, while others make no charge. Checks in process of collection often pass through two or three banks, so that when the creditor balances his account with his banker at the end of the month, he finds a bill against him for collection of such checks which often is appalling. Let the merchant in imagination put himself in the jobber's place for a moment and see how he will like it. If a merchant should sell an article for \$5, and the customer should offer \$4.90 in payment, the remaining 10 cents would be demanded or the sale rescinded. Let the merchant apply this to his transactions with the jobber and the moral is apparent.

Every check must bear a 2-cent revenue stamp. Nine out of every 2-cent stamps on an average can be saved by making a list of drafts wanted and drawing one check for the entire sum. The exchange charge by the bank, if any at all, will in the majority of cases not be more than the revenue stamps saved and nine out of every ten entries in his bank account will be avoided. If the merchant will pursue this method he will avoid injustice to the jobber with but little if any expense to himself, and will improve his standing an hundred fold. A merchant may believe that his check is acceptable and that the jobber does not object, but down deep in that jobber's heart is a feeling of resentment that bodes no good to the perpetrator of the injustice.

**Why Personal Checks Are Used.**

Upon receiving a copy of the foregoing circular, Dross, hardware dealer in Warsaw, Ill., addressed a reply, in which the dealer's side of the controversy was presented as follows:

We have received your circular relating to the use of personal checks in payment of invoices, and as we are one of the offenders we should like to say a few words in our own defense.

We hardly think that we or other dealers would want to do an injustice to the jobber, and the only thing, in our opinion, that causes a dealer to pay for his goods in personal checks is that his bank charges him 20 cents on \$100 or fraction thereof for every draft, and if a dealer has ten or a dozen bills to pay every week and it costs him \$2 to buy the drafts he will have a strong inclination to send his personal check, if he thinks it is good.

The use of checks may be wrong, but it is our opinion that the best way to remedy the evil would be for the jobbers to give their association a list of those who send them checks and then let your bureau use its best endeavors to induce the bankers to quit charging so much for drafts. Then you will find most dealers will send drafts.

**Tube Making Concern in Trouble.**

A petition in involuntary bankruptcy has been filed against the Mannesmann Cycle Tube Works, which has headquarters in Adams, Mass. It is stated that the company owes more than \$414,000.

## MILWAUKEE TIRES

—PUNCTURE PROOF—

Pneumatic

Single Tube

Resilient

Easy Riding

COPYRIGHT 1898 BY MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO.  
PRESENTING TESTIMONIALS.

MILWAUKEE, WIS., December 1, 1898.  
Gentlemen: I cannot praise your tire enough for the benefit I have received from them. I have ridden a pair of them for two years without a puncture or a bit of trouble, and I have caught people trying to stick hat pins in them when they heard that they were puncture-proof, but they failed to even make an impression on them.  
I cannot tell you how much trouble they have saved me on long-distance riding. No cyclist need have fear of a puncture if his wheel is fitted with your tires. I have been with cyclists when their tires have punctured far away from home, but I have had no such trouble with mine. Why is it? I ride the Milwaukee Patent Puncture-Proof Tire.

(Signed), Yours truly, JAMES J. FLANIGAN.

RHINELANDER, WIS., December 10, 1898.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., Milwaukee, Wis.  
Gentlemen: It gives me great pleasure to say a word for the Milwaukee Patent Puncture-Proof Tire. I purchased them eight months ago and have never had a minute's trouble with them. Have tried all kinds of so-called "Puncture-Proof Tires" without success until I purchased the "Milwaukee," which I believe to be the only Puncture-Proof Tire.

(Signed), J. W. ATKINSON.

Representatives Wanted. Write for Prices and other Information.

**MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.**

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## AGENTS' PREMATURE ANXIETY

That "coming events cast their shadow before them" has been verified in the bicycle trade in the form of slow orders from bicycle dealers whenever in the past the business horizon has seemed clouded with the portents of great events of which it seemed difficult to predict whether the effect would stimulate or clog the trade. Such was the case before the last presidential election when the depression was general. When the war rumors commenced to circulate last year the shadow was again visible and this time with more distinct reference to the bicycle business.

The dullness which prevails at the present time may be ascribed to the weather, but this explanation is hardly sufficient. There are many indications that the projected combination of bicycle and parts manufacturers also has a good deal to do with it. The agent asks himself how it will affect him and the uncertainty of the answer stays his hand even against his will and against the clear perception that the combination will not increase nor diminish the public's buying capacity in his own or any other locality. This last mentioned point should undoubtedly steel the agent against unprofitable anxiety for the present and dispose him to go in vigorously for all the profits that are visible in the retail situation today whether the combination materializes or not.

But it is truly said that it is the shadow which the coming events cast before them. The light is rarely anticipated, and were the projected large deal eventually to turn the agents' lots into a blissful state of unbroken financial prosperity, the effect of the present uncertainty would yet remain one of disquietude and hesitation, such as may be overcome only by a firm resolution not to allow it to interfere with the daily pursuit of trade.

An example of the thoughts which are agitating the minds of the retail trade is presented in the following letter addressed to A. G. Spalding by Poag & White at Rock Hill, N. C.:

Will you kindly answer, if possible, the following questions?

If the proposed bicycle combination is successfully organized, how do you think it will affect us, who are exclusive bicycle agents? Will we have a good show for the agency of the combination's goods and how will agents be appointed? From what we read of this proposed bicycle combination, we think it means everything to us or nothing at all; that is, if we can get the agency of the wheels that they manufacture, it means our salvation, otherwise our ruin.

Any information that you may see fit to give us will be greatly appreciated.

Mr. Spalding has given this letter, and his reply to the same, publicity by forwarding copies of both to the cycle trade journals. His estimate of the situation will be read with interest by most cycle dealers, although it is inherent in the nature of things that eventually the retail sale of bicycles will be shaped by larger forces than any one man's opinion. Mr. Spalding is, however, as close as possible to the sources of present intentions and what he says to exclusive and desirable bicycle agents is doubtless entitled to a great deal of consideration by all who count themselves in this class. He writes as follows:

Replying to yours of the 4th inst., relative to the proposed bicycle combination and the effect it will have on exclusive bicycle agents, I hasten to assure you that you need give yourself no uneasiness, for your interest and that of all legitimate bicycle agents and dealers will be fully and better served by the proposed combination than it can possibly be under the present system of conducting the bicycle business.

While it is impossible for any one at this time to speak authoritatively as to just what will be the policy of the new company, yet it is my personal opinion that warehouses will be es-

tablished in the leading cities from which agents and dealers can draw their supplies, and as this company will probably not engage in the retailing of bicycles but as far as possible will confine itself to the manufacturing of them and will depend upon the regular established agents to distribute the goods to the consumer, it is fair to presume that it will be the policy of the new company to cultivate the pleasantest possible business relations with all desirable bicycle agents and dealers and in sufficient numbers to cover the ground thoroughly. Fixed retail prices will be made and strictly maintained and liberal and uniform discounts will be made to agents and dealers. The present established brands and individuality of each wheel will no doubt be continued and agents and dealers will have a larger line to select from all of which will result to their advantage, tend to perpetuate their business and make it more stable and profitable, and at the same time more satisfactory to the riding public.

From the experience of the past, it is fair to assume that the agency system will be continued something on its present lines, though no doubt certain factories will continue to make wheels especially for the jobbing trade same as they are now doing.

In a general way I feel safe in saying that the agents, dealers and jobbers will have little cause to complain when the policy of the new company is definitely announced, and it is my opinion that every interest in the bicycle trade will be improved under the new condition of affairs that this combination will create. It is quite apparent to nearly everybody connected with the bicycle trade, whether as manufacturers, agents, dealers or jobbers, that something must be done to place this great industry on a more stable and better business basis, and I am very certain that this proposed consolidation will have that effect.

Don't be alarmed at any of the alleged interviews and unfounded rumors that are floating around the press as to the future policy of this new company. They are all merely guess-work, without authority, and generally misrepresentations as to the actual facts. This combination will in no way affect this season's trade and each concern will conduct its own business for the balance of the year in its own way. The bicycle agents and trade generally will be fully advised of the future policy of the new company in ample time to prepare for next season's trade.

## ACCEPTING MACHINES IN TRADE

The custom of making arbitrary cash allowances for second-hand bicycles, same to apply upon the prices of new machines, was unbusinesslike in its conception and, as commonly practised, damaging in its tendencies and results. Yet few will deny that the handling of such stocks is a legitimate—even inevitable and inseparable—part of retail cycle merchandizing for the reason that the preferences of large numbers of people begin only where the purchasing capacities of multitudes of others leave off. Such being the case, the one great class of buyers mentioned almost mechanically supplements the other and together they by degrees sweep clear the floor of the ably managed salesroom. These are well-grounded and doubtless permanent conditions of business quite beyond the abilities either of manufacturers or dealers to control or appreciably alter.

The chief necessity is to guard against loss at all points in handling second-hand stock, since the unnatural attempt to stifle the exchange penchant would be certain, in a vast majority of cases, to prove abortive or destructive. This necessity is being widely and boldly met by large numbers of dealers in their determinations—as regularly chronicled by the correspondence of the Cycle Age—to force allowances on worn bicycles down to a conservative minimum.

Sales of old machines might be effected whenever possible by the cycle agent as a simple matter of accommodation to a valued patron. The responsibility however ought to remain exclusively with the owner until the cash for the same is fully paid. In the meantime he should pay for his new mount without reference to the older one, and as the proceeds of the latter are received by him, they should be handed over in full, unless other agreement has been made. The buyer should plainly understand that such procedure on the part of the agent is purely voluntary and in evidence of good will.

The Buffalo retailers who have adopted this plan, as mentioned by the correspondent of the Cycle Age in the issue of March 16, have theoretical and practical right on their side, and the combination is as good in trade as in morals. When the retailer is divorced from the necessity of humbly serving the purchaser, at whatever inconvenience or hazard to himself, yet putting forth every reasonable effort to cooperate with him, the trading-in evil should pass permanently away from cycle merchandising.

## BRAZING BY IMMERSION

### Two-Part Fire Box With Side and End Feeds—Racks for Rapid Handling of Frames

Oblong trough-shaped crucibles are generally supported in the middle by buttress-like projections from the side walls of the furnace. The central portion of the fire box is thus undivided except along the sides, the coals comprising practically one fire underneath the crucible. The Hoffman Bicycle Co., however, has departed from this plan. Its furnace was originally installed by a fur-

Fig. 1.

nace builder and afterward rebuilt to conform to the ideas of the men in charge of the plant. The crucible support in the rebuilt furnace is shown in Fig. 1, and is exactly the reverse of the previously mentioned plan.

Underneath the narrow bottom portion of the crucible is laid a short wall of fire brick which divides the fire box in two in the middle for a distance approximately equal to the width of the crucible. Along the side walls there is free passage room for heat and flame, which may thus rise unbroken along the sides of the crucible. In the place of cover tiles the Hoffman furnace is provided with a series of bricks, the under sides of which are but an inch above the upper edges of the crucible. The side walls, too, are but an inch away from the outer edges of the side flanges of the crucible. This close arrangement of parts is for the purpose of forcing the flames across

Fig. 2.

the crucible before any of their efficiency has been lost because of circulation through comparatively open passages.

#### Coal Feeds in Furnace Sides.

The fire being in two parts the coal must be fed through doors in both ends of the furnace, and to supplement this means of reaching the fire two loose

bricks have been left near the top of each side wall of the furnace. These bricks may be removed at will, and through the openings thus afforded coal in small quantities may be dropped into the fire from time to time without cooling off the furnace to the degree caused by opening wide the end doors. These loose projecting bricks may be seen in the exterior view of the furnace in Fig. 2.

#### Adjustable Rest for Tongs.

As no immersion brazing operator will care to stand up to a furnace and dip frames for ten hours without some aid in supporting the frames while certain joints are being held in the brass, rests of different sorts have been devised upon which the tongs may be placed after the joint has been lowered into the molten spelter. But as a frame being brazed at the crank hanger must be held by the workman's tongs in a much different manner than when the head is being dipped, no one rest will be satisfactory in all cases. The Hoffman company has devised the rest shown in Fig. 2, that the operator may be afforded an adjustable support for his tongs. The rest is quite similar to the ordinary music rack, with spreading legs and telescopic standard which allow a wide range of height

Fig. 3.

adjustment, the only practical difference being that it is much heavier and more stable. At the top of the standard is a hook into which the tongs may be dropped. The rest is adjusted to a height convenient for dipping a certain frame joint, and after a specified lot of such joints has been brazed the rack is changed to suit the requirements when brazing some other joint in the same lot of frames. In this way the operator is saved much physical exertion and can handle his work rapidly.

#### Round Crucible a Universal Support.

Brazers using round crucibles instead of the usual oblong pattern have found that rests of any kind are unnecessary in brazing the three most important corners of a frame—the head, the hanger and the seat cluster. If the crucible be not too large the frame can in each of these instances be lowered into the crucible till it is supported by the edges of the crucible itself. Dipping in this fashion is illustrated in Fig. 3, which shows the average depth to which joints will be immersed when the frame is supported by the crucible walls. One operator of such a crucible does not even employ a pair of tongs in handling the frames. He picks up a frame and grad-

ually lowers the joint to be brazed into the spelter till the frame tubes touch the crucible wall. He then leaves the frame in place till the immersion period is ended, when he lifts it out, sets it aside and repeats the operation with another frame. He finds no difficulty in keeping at the work throughout a full day's time.

#### Frame Rack and Boy Helper Save Time.

In the Hoffman factory fifteen frames are handled at a time—that is, the fifteen frames are dipped at some one particular corner in succession, then the round repeated at some other corner, and so on till the lot is completely brazed. That the operator may work rapidly, a boy is employed as a helper whose duty it is to handle the frames before and after the dipper has had them. A rack made in the fash-

Fig. 4.

ion illustrated in Fig. 4 is placed near the furnace and back of the operator. At the right of the operator is a sort of rack comprising one horizontal and one vertical board. The manner in which a frame is set upon this rack is seen in Fig. 5. At the beginning of the work the large rack contains its fifteen frames hung upon the L hooks. The boy takes the first frame from the rack and places it on the side rack, where it will be in a position from which the dipper may take it up conveniently with his tongs. As soon as the operator has picked up the frame the boy places another in position for him. After the first frame has been dipped the workman hangs it on a hook suspended from the ceiling and at a little to the right of the furnace. The helper removes the frame from this hook, places it on the large rack and with a metal brush brushes off as much as pos-

Fig. 5.

sible the superfluous spelter. The operator has in the meantime taken the second frame from the side rack, so that the boy now has to put another there, and thus the operation is repeated till each of the fifteen frames has been brazed at all corners.

The reason for handling fifteen frames in this manner instead of a greater or

less number gauged by circumstances is that in this factory a peculiar method of dipping is practiced. Being willing to sacrifice speed to good results, and believing that the frames should not be passed through flames, the furnace is heated up to brazing temperature and the blast then shut off. It has been found by experiment that the latent heat of the spelter after the shutting off of the blast is sufficient to maintain a brazing temperature while fifteen joints are being dipped. So fifteen frames are dipped at, say, the crank hanger, and then the blast turned on and operations suspended till the original heat is again attained, when fifteen steering heads, seat clusters or rear ends, as the case may be, are dipped. Much time is lost by this successive reheating, but while the frames are actually being dipped the work proceeds with but little if any waste of time. Were the same method of handling employed in a factory the management of which had no objection to dipping the frames steadily without shutting off the draft, at least 120 frames might be dipped in a ten-hour day, for in the Hoffman shop, where but four hours of time is actually employed in dipping, 48 frames are brazed per day in one crucible.

**Cleveland Adopts Repair Schedule.**

Cleveland, April 10.—The committee appointed by the local cycle board of trade to draw up a list of repair prices made its report at a recent meeting and the following list, which will be printed on cards in large type and posted in plain sight in all board of trade stores and repair shops, has been accepted:

New top tube put in.....	\$4.00
New lower tube put in.....	4.00
New top and bottom tube put in.....	6.00
One rear fork side put in.....	3.75
Two rear fork sides put in.....	5.25
Assembling and knocking down, extra.....	1.50
One new front fork side.....	2.00
Two new front fork sides.....	3.50
New stem.....	2.00
New crown.....	2.50
New tip and enamelling (each).....	1.00
Cutting down frame, material and enamelling complete.....	7.00
New rim put in.....	1.50
Respoiking one wheel.....	2.00
One new spoke.....	.25
Additional spokes.....	.10
Truing wheels, no new material furnished, per hour.....	.50
New dress guard.....	1.75
New chain guard.....	1.75
Lacing guards, two sides (cotton).....	.75
Lacing guards, two sides (mohair).....	1.06
Lacing chain guard.....	.50
Cleaning machine complete.....	1.50
New cork grips, one.....	.25
New cork grips, two.....	.40
New chain link.....	.25
Repairing one ordinary puncture, single tube tire.....	.25
Vulcanizing one puncture, single tube tire.....	.50
Vulcanizing two places when tire is off.....	.75
New valve stem put in.....	.50
Cementing on tire, extra.....	.25
Repairing ordinary puncture, detachable tires.....	.25
Repairing each additional puncture, detachable tires.....	.15
Repairing ordinary puncture, double tube tire.....	.50
Each additional puncture, when inner tube is out.....	.15

**Special Insurance for Cyclists.**

An insurance company was formed some time ago in Paris for the especial purpose of issuing accident policies to bicyclists, motocyclists and persons riding in private motor vehicles. The company has a capital of \$200,000. It is becoming well known in Europe and is securing much business. In case of accident to a wheelman who holds a policy the company repairs all damages to his machine besides paying a daily indemnity of sixty cents to \$2.40 if he is injured so as to incapacitate him from work. In case of death his family receives \$1,000 to \$4,000 or more according to the premium paid. If the cyclist knocks down and injures a

child or other person the company will take up the case and pay the required indemnity. Similar provisions are made for motocyclists and automobilists.

**BLESSING IN DISGUISE**

**Dealers Will Make License Decision an Excuse for Refusing Old Machines in Trade.**

Washington, April 10.—“Trading in” will not figure so prominently in local bicycle transactions this season as heretofore, owing to the recent decision of the court of appeals to the effect that dealers must take out an annual license of \$40 if they buy or sell second-hand machines. Many dealers will not take out a license and they can consistently refuse to accept old machines in trade knowing that many of their competitors will take the same stand.

Local bicycle dealers who added side lines to their regular business last fall have been in most instances eminently successful. Cash registers, phonographs and cameras proved to be the best paying side lines. One dealer who added cash registers late in the fall has been successful beyond his most sanguine expectations, having built up a trade that is bringing him in considerable revenue. No sooner did he begin to make headway than a rival concern started to break up his business by throwing every obstacle in his way, but he persevered and by courteous treatment and good business tactics managed to swing trade his way. Today his business is in a flourishing condition and gives promise of immediate expansion, notwithstanding the fact that his competitor is putting forth every effort to drive him out of the business by means of slanderous reports.

The trade is subscribing liberally to the fund to build a cycle path to Baltimore and is bringing all its influence to bear on the project to the end that local wheelmen may have a cycle path that will be second to none in the country.

**Satisfied With Installment Plan.**

The installment plan of selling machines seems satisfactory in Minneapolis and few losses occur. A fair amount is asked down and the balance runs from three to five and six months. On \$25 bicycles from \$10 to \$12.50 down and \$5 to \$7.50 per month is asked. A few dealers add \$2.50 to the price on lease. On \$50 models from \$15 to \$20 down and from \$7 to \$12.50 per month are the usual terms. One firm adds \$3.50 to the price on time, but does not always get it.

A furniture company, which does the largest installment business in the city, states that it has no trouble on the small installments asked and does not add any interest on leases. It has been selling this way for three years and expects to continue this year, so the plan must be satisfactory.

Trade is very late there on account of the late spring, but when it opens it will come with a rush and will soon be over with.

Models retailing at \$25 to \$35 and \$40 will be the sellers in the northwest. Carload lots have been received by two leading retail concerns, in order to save freight and get the best price.

Considerable interest is being taken in chainless models, but it is not expected that a great deal of business will be done in them in 1899.

**Price Cutting in Winona.**

The Gate City Plating & Cycle Co. of Winona, Minn., feels aggrieved over a statement that appeared in the local press a short time ago intimating that it had started the rate war among the cycle dealers. According to the statement of the

manager, the company installed an extensive plant for the purpose of enameling frames by the dip process and made the price \$1. It seems that other dealers regarded the announcement as an invitation to open a rate war and a general tumble in prices has followed so that work that formerly cost from \$3 to \$5 can now be secured for a third of that expense.

**Exports for One Week.**

Exports of bicycles and cycle materials from the port of New York for the week ending April 4 are recorded as follows:

	Bicycles.	Materials.
Germany ..	\$35,131	\$ 3,896
England ..	25,857	3,477
France ..	11,349	3,767

Totals ..	\$94,274	\$19,656

**Exports for February.**

Exports of cycles and bicycle materials from the United States for February, 1899, in comparison with those for the same month in 1898 and 1897, are recorded as follows:

	1897	1898	1899
United Kingdom ..	\$228,651	\$210,661	\$ 49,832
France ..	17,452	71,168	48,833
Germany ..	76,354	184,048	102,107
Other Europe ..	75,364	143,770	172,854
British N. America..	73,136	44,395	53,719
Central America ..	5,014	328	240
Mexico ..	5,739	5,619	6,944
Santo Domingo ..	557	47	.....
Cuba ..	219	883	1,974
Porto Rico ..	33	14	266
Other West Indies....	12,353	5,145	3,933
Argentina ..	1,110	9,104	17,115
Brazil ..	1,986	13,107	3,749
Colombia ..	923	464	228
Other S. America..	10,800	4,604	1,644
China ..	655	3,364	2,260
East Indies (British)..	1,527	6,449	6,469
Japan ..	3,062	4,603	2,494
Australia ..	34,816	19,773	29,205
Asia and Oceanica ..	5,020	9,223	6,408
Africa ..	10,972	17,107	15,708
Other countries ..	.....	.....	2
Totals ..	\$565,743	\$754,476	\$530,537

**Cycle Imports Bother Canadians.**

Weeks before the current rumor concerning the consolidation of the Canadian bicycle makers gained headway, the Cycle Age fully aired the subject, pointing out that it was part of the alleged plan to shut out foreign machines. The following table shows the number of bicycles imported by Canada for the past three years, together with their valuation, a remarkable feature of the trade being the varying average value—\$32.28 in 1897 and \$21.45 last year:

Year.	No.	Value.
1896 ..	17,267	\$732,999
1897 ..	23,526	759,366
1898 ..	27,400	597,728

The railroad companies are in strong sympathy with the good roads movement in Illinois and Indiana, as their traffic is frequently reduced considerably when country roads are in bad condition for hauling.

## PLAIN TALK TO DEALERS

### Interdependence of Agents and Makers—Rules for Buying —Perils to be Avoided

To Agents—Let those of us who have in the past harbored the delusion that the interests of the maker and dealer are opposed to each other, and that the first thing for the retailer to do was to make sure that he was getting the better of the maker, promptly unload this false notion. The dealer's permanent prosperity cannot be built on a foundation of the maker's adversity. Nor can the maker build up and increase his business permanently at the expense of the retailer. These interests are mutual in the highest degree; when one is prosperous each benefits by the prosperity of the other and thereby adds to his own prosperity.

#### Mutual Interests.

The maker and the dealer working hand and hand along business lines can accomplish in a short time all that is needed to place the trade on a proper basis. Either one working alone, and opposed or hindered by the other, can accomplish little or nothing. So let us cultivate friendship and good understanding with the right class of manufacturers, and thereby discourage the other manufacturers whose policies and methods are opposed to our interests.

Next, let us always bear in mind the matter of quality when we are considering the question of price. Let us strike the true balance between them and not let either end of the question have sole sway over our thoughts. These questions of quality and price are two subjects least understood in their true relation to each other of any in the cycle trade. Of course, other things being equal, price will always determine a deal. But, on the other hand, price being equal, look carefully to quality.

#### Six Points of Quality.

What is quality? From the dealer's standpoint it is a combination of all the things which should be present to constitute a distinctive whole.

First of all, look to the material of which the bicycle is made. Don't accept low-priced material when paying a price which should include high priced material only.

Second, look to the mechanical finish and exactness of the various parts, and remember that as a rule a bicycle built in its entirety in one factory is much better than one built of parts collected from different makers and not primarily designed for and in relation to each other.

Third, look to the superficial finish, the enamel and nickel; and in combination with this look to the general design. These last two points come most directly under the notice of the public, and are the ones you must depend upon to produce that all important "first impression" which, if favorable, operates to render sales easy, but which if unfavorable is a sure wet blanket on all your persuasive arguments. A machine which will cause the customer to smile when given his first view of it is half sold on the spot.

Fourth, consider the responsibility of the maker. Can he be depended upon in all matters, and will he be able to take prompt and proper care of your orders during the rush season?

Fifth, consider whether the machine has a reputation and is vigorously advertised by its maker. Don't waste valuable time trying to sell your customer something nobody has ever heard of before, and regarding which he can have no preconceived liking or respect.

Sixth, look up the record of the machine. Has it ever been offered through department stores, auction houses, or curbstome agents? Has the price ever been broken in mid-season? Can you take it up and push it vigorously, feeling assured of a clear field and proper protection?

#### Judging by the Record.

These six points all have a bearing on the question of quality as viewed from the standpoint of a retailer, and none of them can be overlooked with safety, for each has a vital bearing on the business to be done. At times it has been, and it still often is, a difficult matter for a dealer to determine, in face of the claims and assertions made by salesmen, what is the proper price to buy at, and when and what to buy. It is often difficult to know when you have found the right thing. Remember, however, that talk is cheap, and that "claims" prove nothing. Look behind the talk and see where it comes from. Look up the records of those who would do business with you. The great majority of cycle makers have now been before the trade a sufficient time to have left a distinct trail by which their course and policy may be judged.

Sell the best and most substantial medium grade machines you can find, when your customer will not or cannot afford the best, telling him he is getting good value for his investment; but don't make the fatal mistake of telling him he is getting a machine "just as good" as he could get for more money. When you choose your medium priced line look for substantial and durable construction rather than faddy catchpenny features of design. Under no circumstances sell a "snide" machine. Let your short-sighted and consequently short-lived competitor have that trade all to himself and get all the satisfaction from it that he is able.

#### Trouble Breeders.

A three dollar per week boy cannot run your business nor mine; nor can he do a man's work in a bicycle factory. These "just as good" machines are every one made by child labor and by slop shop methods, and they invariably show their pedigree by their performance. They make trouble, and nothing but trouble, during the whole period of their usually very brief career.

RETAILER.

### REPAIR PRICE SCHEDULES

Evils Caused by Existins Irregularities Can be Overcome by Wide Adoption of Uniform Scale.

(Reprinted from The Cycle Age.)

On another page there is presented a list of the repair prices in various towns.

In looking over the list it is at once apparent that great irregularities in prices prevail; that the same piece of work is estimated as being worth very much more in one town than in another. In several instances some towns in which greatly varying prices are charged, are so close together on the map that it must happen frequently that cyclists from one of the towns visit the other town and have occasion to become acquainted with the variation in charges.

The moral effect of this condition is, of course, to prime the public thoroughly with the idea that all repair prices are arbitrary and extravagant, and thereby bring about a general suspiciousness and

ultimately force prices all over to the lowest notch. When that point has been reached the ambition to do good work, on the part of the repairman, must gradually vanish and give way to a desire to do as little as is absolutely required for obtaining the depressed price which the customer grudgingly pays.

If a somewhat uniform scale of prices could be adhered to the downward tendency which has already gone too far, might perhaps be arrested and a higher standard of workmanship would eventually follow.

The experience with uniform price schedules has, however, not been altogether successful except in places far removed from the centers of the bicycle and parts-making industries, and before any attempt is made to reach a general and fair estimate of what each of the most common repair jobs is worth, the cause of previous failures should be looked into.

A repair price schedule should be flexible enough to suit existing conditions, and it should not be plainly inimical to the interests of the public who are expected to pay the charges.

Better results may be expected from a schedule which gives maximum prices for the information and protection of the public while leaving the repairman all the latitude which he may desire for showing special favors to customers by lower quotations when circumstances warrant them.

#### A Curio in Spring Tires.

Johnannes Avertician Calantaricuts of Scarborough, England, doctor of medicine, proposes the construction of a resilient tire for bicycles which is shown in the illustration, and has secured U. S.

patent for it. The stem which pierces the wheel rim is square to prevent the spring from rotating. The doctor considers it an important advantage that each of the springs, if injured, may be readily removed and replaced with a fresh one, thus keeping the tire continually in good working order. Supposing a good sized stone should become wedged in the crotch of a spring while the rider goes at a good speed, it seems not impossible that the spring might act as a sling shot and throw the stone with considerable force against the back or head of the rider. In this way the tire might bring business to the doctor.

#### Second-Hand Trade a Specialty.

"Bob" Garden, bicycle dealer in Philadelphia, is interested in a new concern, the Yankee Cycle company, with headquarters on South Ninth street, which makes a feature of the sale of second-hand bicycles of undoubted pedigree. Garden has adopted as the slogan of the new firm the following characteristic phrase: "A good second-hand bicycle is better than a poor new one"—and the amount of business being transacted by the new concern would seem to indicate that he is not alone in this belief.

The Italian Touring Club now has 16,000 members and \$8,000 in the treasury.

# THE STERLING

## "BUILT LIKE A WATCH"

THE CHAINLESS TYPE HAS COME TO STAY.

Chainless construction has long passed the experimental period, and is now an accomplished success, and a very powerful factor in the bicycle market. The demand for Chainless models exceeds the most sanguine expectations of the manufacturers, proving beyond question that their popularity is established.

IT PARTICULARLY APPEALS TO BUSINESS AND PROFESSIONAL MEN

because of its smooth and noiseless riding qualities; its freedom from the dirty, noisy chain; its adaptability for muddy streets and wet weather; and the small amount of care, cleaning, lubrication and adjustment required.

The live agent with a first-class Chainless in his line of wheels, is placed head and shoulders above his less fortunate competitors.

THE STERLING CHAINLESS is the ONLY ONE with INTERCHANGEABLE rear bevels, giving the owner two widely different gears at pleasure.

Our catalog will explain the details of construction, and we will gladly talk agency to you if you are interested.

## COMMERCE IN FOREIGN MARKETS

### Drop Frames for Korea

Few of the natives in Korea use bicycles, but the habit is growing. Most of the bicycles in use there are purchased in the United States, Japan or Shanghai. The majority are American, however, and most of the standard makes are represented. What is most required to increase sales is repair shops. At present every rider must be a mechanic and carry his own reserve parts.

Catalogues and prices should be in English, the prevailing commercial language. Small dealers pay cash on receipt of goods. Ladies' cycles will sell best, as both men and women wear long coats or skirts, which must be girded up for riding a diamond frame—a mode which natives do not like. All American missionaries ride. Korea has a silver standard and as bills of exchange are paid at the rate of coinage when due, provision must be made against falling prices.

The inhabitants have no idea of technique or the mechanical superiorities of the different makes and such explanations are of no use whatever. Therefore catalogues and correspondence must be in plain, matter-of-fact terms. Steel rims are in favor, but wood rims will do, the climate being good. Display rooms in the large towns are necessary; also the strictest adherence to the wishes of agents, as it takes a long time to communicate with manufacturers.

### Low Priced Machines for India

The best way for a manufacturer to sell bicycles in India is to send a representative with samples to arrange agencies. Sending out catalogues, however attractive they may be, is a waste of money unless followed up with personal solicitation and samples. The outlook in Bombay for the bicycle business is very encouraging. It is the exception now to find any European of either sex who does not ride.

But it is to the natives one must look for a really large demand, and it has been astonishing to note how rapidly the number of native riders has increased during the past four years. At first English cycles monopolized the market, but during the past two years several American makes have been introduced, and, in spite of their cost, are making headway. There is some demand for the highest priced cycles, but if American manufacturers would export bicycles that are "just as good" at a more moderate price they would get much better results in that country. The people in India want low prices and cannot be convinced that the \$75 bicycle is worth \$25 more than the \$50 machine.

The principal ports of entry in India are Calcutta, Bombay and Madras. Agencies have been established in all the larger interior cities also. There is no particular time of the year for soliciting the wholesale trade, but, as the dull season in the trade is during the monsoon, that perhaps would be the best time for beginning new arrangements in order to be ready for the increased demand in cold weather. The best cycling season is from November 1 to April 1, although the majority of the people ride all the year around. The cheapest way of shipping is by the direct line of steamers from New York to Bombay and Calcutta—Bucknall's line.

Wood rims are not highly regarded in India. Japanned steel rims give the best

satisfaction. English tire valves last much longer than the American ones. The climate is very hard on rubber and its life is much shorter than in temperate climates. Metal mud guards are preferred on front and back wheels. Gear cases also are much used. English shippers usually give 30 to 60 days to reliable parties. Not much business is effected on the usual New York terms, cash f. o. b.

### Persia an Unpromising Field

There is little encouragement to hope that the bicycle will in the near future become a popular means of locomotion for the Persians. There are only about 20 machines in the whole country, and these with one exception are the property of Europeans who have taken them into the country for their own pleasure or convenience. So far, the natives have not been captivated by them, and look upon the horse and mule as more dignified in appearance and more comfortable in use. The Persians are very conservative in their habits of thought and life, and are slow to adopt innovations aimed at established though antiquated customs. It is not to be understood that the bicycle will not become a favorite method of traveling and possibly of pleasure to the people of Persia, but so far it has not secured many adherents. The roads are generally rough and the streets uneven and narrow and unsuited for cycling.

Most of the bicycles in use are of English make, possibly one or two German. There is no retail trade. Catalogues should be printed in English or French. A Persian never buys for cash if he can get credit, even though it may be to his advantage to do so and he has the money in his pocket.

At the present time there are really no pastimes or sports indulged in in Persia. The ancient games which bred and incurred the old Persians to fatigue, hardship and war have disappeared, and lust, effeminacy and dissipation have taken their place. If an exhibition of bicycles could be made in one of the principal stores, it might have some effect and induce those who could afford it to buy.

### Trade Conditions in Germany

The German cycle manufacturers will be represented at the special cycle show to be held at the Paris exhibition in 1900. This exhibition will be held at Vincennes, for the reason that insufficient space was allotted at the world's show. The German manufacturers will erect a special pavilion 270 by 135 feet. Only 32 exhibitors will be allowed to take part. The price for space per square foot will be nearly \$10.

The Adler Cycle Works, Frankfurt on the Main, had a remarkably good season last year in spite of all competition. The net surplus for the year was \$245,750, while the cost of carrying on the business was \$300,000. The company pays on the original shares 20 per cent, and the new shares 10 per cent dividend; \$8,750 go to the special reserve, and \$37,500 to the dividend reserve.

The chamber of commerce in Cologne, in its annual report for 1898 states that the German cycle industry suffered last year mainly from the unfavorable weather during the best part of the season, and from foreign competition, especially

American. Business did not satisfy expectations, although there was no falling off in demand, but a large increase in import and over-production, which forced a reduction in prices hardly in accordance with the cost of production. There is a desire, especially among new firms, to force the sale by the establishment of branches, giving goods in consignment, etc., which will not give the desired benefit. Cases of bankruptcy and insolvency are frequent, and it will take some time before the business will regain its position. The quoted sale prices are calculated without due regard to the cost of production. The prices of the material are very low at present, but products are sold far under the cost of making, as for example tubes, steel balls, etc.

The best field for the products of the German cycle industry was, until lately, the home country, and even last year the belief was maintained that Germany could not produce sufficient for its own wants. The export of cycles is, at present, about a tenth of the total production, but the necessity of looking out for other markets increases every day, and German competition must look to the export trade for its salvation. The products of most concerns have decreased during the last few months, owing to the large stock held, and new factories are very few. But, as soon as good weather sets in, it is believed that the surplus stock will be sold, when a better state of affairs will reign.

### The Chinese Riding Bicycles

The Chinese residents of Calcutta—and there is a large number of them—have taken to cycling with a will, and their progress in learning to ride is very marked. The ordinary Hindu and Mohammedan cyclist is quite satisfied to start his wheeling career with an old crock painted in imitation of the rainbow; but such is not the case with John Chinaman. He prefers a new machine, and he not infrequently makes his purchase at a European shop, selecting a high class machine, but he invariably demands a two years' guarantee. There is every indication that Calcutta will have a Chinese cycling club before long. Such a club is being organized in Rangoon.

German cycle exports in 1898 show a great increase over the previous year, the number of bicycles exported in 1898 being 40,752 against 27,201 in 1897. The values were 15,000,000 marks and 10,000,000 marks respectively. These figures do not include what was exported in "parts." Austria was the largest buyer. Sweden, however, towards the end of the year, was largely increasing her purchases.

In St. Petersburg bicycles of American manufacture largely predominate, while in Moscow most of the machines used come from England.

France last year exported motor vehicles to the aggregate weight of 350,000 pounds, and imported similar vehicles to the weight of 79,000.

A petition urging the Russian government to impose the same duty on frames and parts as on complete bicycles is being circulated and signed by Russian manufacturers.

## Comfort

**T**HE comfort of a saddle depends largely upon intelligent construction in the earlier stages of the work. It is easy to make something and call it a saddle, but is it just as necessary to have a thorough *practical* knowledge of what constitutes a perfect saddle, before one can be made, as it is to have a thorough knowledge of cutting before a good and well fitting suit of clothes can be made. The lack of such knowledge results in botch-work, and we see lots of it, both in clothes and in saddles.

Neither of them will ever command the respectful consideration of those who know (and their name is legion) what constitutes good work, and the makers of them are soon relegated to oblivion.

It is the strongest and most convincing evidence of the perfection in *style, durability, and comfort* of the saddles produced by this company, that their goods command the admiration of more than eighty per cent. of the riders of this country and a very large proportion of those of other countries. Write us for information and catalogues. We shall be happy to furnish either or both.

## SUBJECTS OF GENERAL INTEREST

### Remarkable Scientific Camera

A new camera, probably the finest ever built, is being constructed in Chicago for the Smithsonian Institution, at Washington. The specifications required that the instrument should be capable of making a successful exposure in one six-hundredth of a second. It is hoped that this speed will be increased so that a good negative may be obtained by an exposure of only a thousandth of a second.

The principal purpose for which this camera was designed is to serve the photographing of aerodromes, with which Prof. Langley, secretary of the Smithsonian Institution, is conducting elaborate scientific experiments in an attempt at the solution of the problem of aerial flight. The instrument is provided with a delicate measuring apparatus, by which the precise angle at which the camera is tilted at the moment of exposure is known to the operator and is also photographed on the plate. This device will enable scientists to determine, under given conditions, the exact location and elevation of the object photographed.

### The New Order of Industrial Affairs

Have the monopolies come to stay? This very important question, says the Journal of Commerce, may be best answered by fairly considering what are the dangers that confront the trusts. Their controlling aim is to defeat competition, not to regulate or moderate it; that is insufficient for the accomplishment of their purposes; but to absolutely extinguish it. Partial or qualified competition in industry is an impossibility; there must be either pure monopoly or full and free competition. If the former cannot be maintained, then the trust principle fails and must be abandoned.

A very large majority of the monopolies have incorporated into their financial structure an element of fatal weakness. In most cases the plant of the several properties consolidated has been egregiously overvalued. Effete, superseded and practically worthless appliances of production have been taken at preposterous valuations; and the deceptive figment of "good will" has been credited with ridiculous values. The result is that, with respect at least to the more recent creations, the capitalization is double that for which a plant of equal productive capacity and including the most recent improvements could be provided. The folly of this fictitious capitalization is inconceivable of the men of sober business methods who have committed themselves to it. It seems incredible that they should have undertaken such schemes in the hope of making them permanent investments; and, if they are to be credited with any definite practical purpose, it must be assumed that at least the more sagacious of them are seeking an opportunity for unloading their interests upon uninitiated investors. About that, however, they are likely to find less certainty than they may have calculated upon.

The recklessness of this procedure is more conspicuous, however, when the magnitude of the task undertaken is considered. The thing attempted is the overthrow of the natural law of competition; the revolution of past methods of industrialism; the dispersal of the numerous and wealthy forces of middlemen; the defeat of the competition between monopoly prices at home and prices fixed by free competition abroad; the conquest of obstacles arising from an

attitude of distrust on the part of the financial community; and the surmounting of whatever hostility may arise from political parties, from the courts, and from the state and federal legislatures. At all these points, strong probabilities of stout resistance face the trusts.

At the moment, we see no symptom of the great reaction against this artificial reshaping of industrialism which must ultimately challenge it. But it has already evoked a profound national apprehension, not only for the institutions themselves but also for the large interests bound up in their fate. That feeling must haunt their progress at every step. But, after a brief interval of specious results and flattering dividends and tactful manipulations of prices, natural remedial forces will make their appearance in the situation.

The funds accruing from the \$16,000,000,000 of annual earnings, which are thus being shut off from employment in the industries and can find no other adequate employment, will make their force felt. The owners of that wealth will find a situation surrounding them in which industrial plant is doubly capitalized, in which prices are artificially sustained, in which large foreign markets are accessible to us, while wages are relatively low; the glut of idle capital will be forcing them to seek employment for their funds; and they will find it the most profitable investment to construct factories upon an ample scale, with the newest equipments, and at half the cost at which the monopolies have capitalized inferior plants.

Among the ranks of these new investors are likely to be found no inconsiderable proportion of middlemen who have been displaced by the trusts and whose experience and trade connections will qualify them for entering upon industrial enterprises. Another contingent may be found to consist of producers of raw material, who have become weary of subjection to the monopolies and are quite ready to broaden the markets for their products and introduce competition into them.

### Extent of the British Empire

The British empire is now a territory of 11,500,000 square miles, or 13,000,000 if we include Egypt and the Soudan; and in this territory there is a population of about 407,000,000, or over 420,000,000 if Egypt and the Soudan are included—a population about one-fourth of the whole population of the earth. Of this population about 50,000,000 are of English speech and race, the ruling race—in the United Kingdom, in British North America and in Australasia; and the remaining 350,000,000 to 370,000,000 are the various subject races, for the most part in India and Africa, the proportion of the governing to the subject races being thus about one-eighth.

The increase in area and population in this empire, excluding Egypt and the Soudan, amounts since 1771 to 2,854,000 square miles of area, or more than one-fourth of the whole, and to 125,000,000 of population, which is also more than one-fourth of the whole. The increase of the ruling race included in this population amounts to about 12,500,000, or about one-fourth of the number in 1897; and the increase in subject races is 112,000,000 or nearly one-third the number in 1897. This increase is largely due to annexation. The existing revenue of the different parts of this empire added together amounts to

\$1,288,265,000, and the imports and exports to \$6,875,000,000. The increase since 1871 is \$570,715,000 for revenue, or more than 40 per cent. of the present total, while the increase of imports and exports is \$2,140,000,000, or about one-third of the present total.

### The World's Two Nickel Deposits

There are but two large deposits of nickel known in the world at the present time. One of these is in Ontario, and the other is in the French colony of New Caledonia, lying in the South Pacific ocean, 7,000 miles from the United States. The mines in New Caledonia produce each year a quantity about equal to that produced in Canada, and are the only possible competitors of the Canadian ore and as the latter has superseded the French product in the free markets of the world, there is no doubt that it has the preference over its rival. But there is some reason to believe that an agreement has been reached between those now in control of the two great fields by which they divide the market.

In the United States there is no danger of any rivalry as producers, for the deposits are insignificant and unimportant. So far the Canadian working classes have been but little benefited by the development of this natural bounty. But if a refining industry is established in Ontario it would doubtless lead to the development of the smelting of other ores, and thus a new factor would be introduced among the industrial interests of the United States.

### Novelties for the Paris Exposition

If the management of the Paris Exposition fulfills its promises, no small number of technical marvels will be revealed to the public in 1900. First of all there will be the much heralded telectroscope, an instrument which is said to have solved the problem of electrical vision. The telectroscope will, however, find a rival in the telautograph, which provides a means of receiving messages sent from one station to another, in exactly the same form in which they were transmitted.

The idea of the telautograph is old; but the inventor is said to have devised an apparatus which is entirely different from its predecessors. He claims to have solved the problem by using selenium—a metal which is unique in possessing the property of conducting electricity with a resistance which varies with the intensity of the light that falls upon it. The varying illumination is produced by treating the written telegram in a peculiar manner, and the variations in resistance effected by the selenium are communicated to a conductor to produce an increase and decrease in the intensity of the current passing therethrough. An imperfect model is said to be in tolerably successful operation, and to be able to transmit in one hour 144 telegrams, each four inches by two inches, upon which space any number of words or characters can be inscribed.

An agreement extending time of payment of notes until the makers can make payments from the proceeds of goods, to be sold as fast as possible in the regular course of business, is void for uncertainty as to time of payment.

## BLASTING WITH WET SAND

### Air Pressure Displaced By Steam—Sand Leaves Blast in Solid Stream—Inexpensive Operation

Confined to a closed room, with head and face tightly wrapped with numerous cloth, glass and metal coverings, with not a breath of fresh air from morning till noon or from noon till night and compelled to stand for hours by the side of a dry, quickly scattering storm of fine sand, the lot of the sand blaster has commonly been far from pleasant. The utility of the sand blast has never been questioned. The inconvenience caused by the discharge of dry sand has been the chief source of the criticism raised concerning the blast as a means for removing flux scale from frames after brazing and before filing. Wet sand is surely a remedy for this inconvenience. Though blasting with wet sand has been a subject for talk among shop men, it is not widely known that the possibility of successfully using wet sand for this purpose has been brought to a practical point.

#### Wet Sand Blasts in Operation.

In the factory of the Fanning Cycle Mfg. Co., of Chicago, there are in opera-

shaft and driven by a light round belt. The sand is carried along by the screw at a speed which exactly supplies the blast pipe with the proper amount of sand. When the sand reaches the blast pipe it is not only wet, but meets with a condition much different from the usual heavy air pressure of the dry blast apparatus. Here steam under sixty pounds pressure discharged through a one-quarter-inch nozzle blows the wet sand in a solid stream through the stationary one-inch discharge blast pipe. The work to be blasted is held by the operator and moved through the blast.

#### Blast Used in Open Room.

The degree to which the blast holds together in a solid stream after leaving the nozzle is well shown in the illustration, the atmosphere in the room being as free from dust as though there were no sand blast in the building. In fact, so well is the blast controlled in the Fanning factory that the blasts are used in an open room, the floor space not occupied by the

probable that there are no dry sand blasts in operation using less than 10 horse-power of air. The steam used by the Fanning blasts amounts to so little that the owner of the steam plant from which it is supplied makes no charge. The working parts of the machines have been designed and constructed so that the sand shall not get into and injure the bearings, and those which have been in constant use since their installation nearly two years ago are still in first-class running order and have cost practically nothing for repairs. This form of blast is now on the market as a complete machine, it being manufactured by F. B. Redington & Co., of Chicago.

#### Emery Cloth Replaced By Blast.

Fanning frames are each subjected twice to the blast. After a frame has been brazed it is blasted to remove the flux and grit, so that the filer has nothing to take from the tubing and lugs but the superfluous spelter and projecting pin ends. One blast operator can easily put 150 frames per day through this operation, making the cost of the first blast very slight as compared with the amount saved in the filing bill. After filing the frames are reblasted, the usual strapping or polishing with emery cloth being thus abolished from the factory. The reblast takes more time than the first blast as the entire surface of each frame must be passed through the blast. However, one blaster is able to finish 100 frames per day.

After the reblast the frames are perfectly clean and free from scale, grit and file marks and covered with a thin coating of fine sand dust. This dust is readily removed by wiping the frames with a cloth saturated with gasoline or benzine, which not only removes the dust but cleans all grease from the tubing, leaving the frames in good condition for the application of the ground coat of enamel.

#### LONG FORKSIDES SHORTENED

Overproduction of Forks for Thirty Inch Wheels Gives One Maker Cue to Economy.

The visitor to a well known factory was looking interestedly at a workman operating a rotary tube cutter and two great piles of front forks. The workman was diligently adding to one pile from the other, the cutter being employed to lop off a liberal inch from the upper end of each fork side before it was transferred to the growing pile.

"You think that looks like we did not know our job?" said the accompanying superintendent interrogatively.

"Well, it does seem that there must have been a mistake, somewhere," was the rejoinder, "most factories get their forksides to the length that is wanted."

"But hardly at the price that we have paid for these. I guess we can afford to cut them about seventeen times and still make money on them. As it happens they fit in our crowns very nicely after they are cut, we can use them, but they were made for fellows who had figured on a large boom for thirty-inch wheels."

"I supposed that much."

"Yes, but we were not the fellows. You are quite right that there must have been a mistake somewhere, but it was not here. I got the tip from your paper, by the way, and when I saw that manufacturers were inclined to credit the thirty-inch idea with more strength than there naturally is in it, I watched my chances and bought pretty low. I tell you it is a mistake to try to rush the whole country into a craze for something like thirty-inch wheels, which may be all right as far as it goes, but has not enough back of it to carry trade with a rush. I will bet you there will be more thirty-inch wheels sold in 1900 than in 1899, although the craze is as flat as a pancake right now."

"Why, do you think they are preferable

WET SAND BLAST IN OPERATION IN FANNING FACTORY

tion daily throughout the building season three sand blasting machines using wet sand, and which to one familiar only with the dry sand blasting process would hardly seem to be sand blasts. The machines have been in use nearly two years and have proven so successful that every frame built in this factory passes in front of the blast nozzle before reaching the filer. The accompanying illustration shows one of these machines in operation and clearly pictures the general appearance and construction.

The sand used is a fine grade of beach sand and is well wet down before it is thrown into the hopper. In the head of the machine below the hopper is a horizontal worm screw about three inches in diameter and having a pitch of about one and one-half inches. This screw is slowly rotated by a pulley on the end of the

blasting plant being utilized by the frame filers. Though the operators use mouth and nose protectors, and sometimes eye shields, the head wrappings are not required to be so close fitting as those used by operators of dry sand blasts. In fact visitors to the shop have stood in as close proximity to the blast as do the operators, and have suffered no discomfort. The blast is directed into a round opening in the wall of the room, an exhaust for the steam and a trap for the bulk of the discharged sand being thus formed on the other side of the wall.

The use of steam in the place of air to supply the blast is not only advantageous in that it affords a clean blast by which men do not object to work, but also in that when used with machines of this description the amount of steam required amounts to but two horse-power. It is

**T**HE rider of a National is always proud of his machine.

It's handsome and well made.

Like a good horse well groomed it adds to its owner's pleasure in simply being "all right."

The real satisfaction in the purchase of a National comes when the buyer finds that his first expenditure is his last. No repair charges or delays later to reduce his cash or spoil his pleasure.

One season on a National and he says—

*A National Rider Never Changes His Mount.*

# OLIVE POPULARITY

SPREADING

In every mail we receive advices of some prominent person being mounted on an Olive wheel.

The Captain of the Yale team has selected a '99 Olive for his mount this season. They all know a good thing when they see it.

The Olive is the popular wheel.

THE OLIVE WHEEL COMPANY - Syracuse, N. Y.

to the usual size, as a general feature of construction?"

"No, not necessarily, but they are good enough for some purposes. They look pretty well in twenty-six inch frames, and some tall riders will like them. They roll along pretty smooth, and people will by and by get used to seeing them. A few others may want them for front wheels. As a boom article they are a flat failure, but as a specialty they are apt to be called for, somewhat. They are a nuisance to the trade now, but if the great combine should come off, there will be room for specialties of that kind without saddling every bicycle maker with the necessity of guessing at his own expense on the extent of that kind of fool booms."

#### Rainforth Brazeless Joint.

The accompanying illustration shows a brazeless joint which has been patented here by H. S. Rainforth of Lincoln, England. The double-cone collar on the tube is sweated on and for further security secured by pins or pegs—not shown in the drawing. The clamping ring is bored to

fit the tube accurately at one end and at the other end fits the outer cone surface of the collar interiorly while the screw threading corresponds to the screw-threaded main lug. When the joint is completed the angular projection on the clamping ring, which serves the purpose of laying hold of the ring with a wrench, is removed by filing or similar means, and the finished joint thus presents a smooth rounded surface.

#### Roller for Roller Skates.

The two patterns of rollers which are shown in the illustration have been patented by T. Rankin and J. J. Busenbenz for the Chicago Building and Mfg. Company. They have a double tread surface

separated by a depressed portion and are of the pneumatic variety. In the first pattern the desired shape of the tread is produced by confining the rubber air ring in a molded rawhide band. In the other pattern two rawhide or metal bands which form the tread are separated by a metal band of smaller diameter. The bands are secured in place by inflation or by cementing and inflation.

#### Annealing of Steel Castings.

E. D. Wassell of Pittsburg, Pa., has secured patent for a process of annealing open-hearth or Bessemer steel by surrounding it entirely with oxid of iron con-

taining about five per cent of lime. Any oxid of iron serves the purpose provided it is fusible between 800 and 1200 degrees Fahrenheit. The process is chiefly intended for annealing armor plates, but may also be used for small steel castings and has the peculiarity that it removes all rust from the work leaving it perfectly free from either oxid or sand. The annealing requires 24 hours, which is a saving of time over previous methods. The patent is No. 622,301.

#### MOTORCARS FOR MAIL SERVICE

Government of British India to Look Into Merits of American Vehicles—Experiment to be Tried.

Kirlokhar Bros. of Bombay, East India, write to the Cycle Age as follows:

To the Editor—As government have asked us if we could undertake to carry mail by motor cars over good roads about 100 miles long, by way of experiment, we request you to enlighten us upon this subject.

We give you the circumstances under which the motor carriages are to be worked:—The road is good and one hundred miles in length. There are many ups and downs, the steepest grade being 1 in 37 for three miles only. During wet season rains are heavy and continue for about 4 months. Very strong winds during monsoons. The maximum weight of mails is three hundred pounds plus the weight of a driver and servant. The vehicle should be very strong, reliable and simple in working and adjustment. It should at the same time be cheap. The tires should be very strong and to be had at any time. Speed 8 to 10 miles an hour.

Which make of American motor carriage will you therefore recommend. Which motive power will be cheap and effective? Kerosene oil or steam? Electricity and gasoline will not do at all. You need not trouble yourself with them. In short any information on the subject that will tend to prove our enterprise a success will be most thankfully received and appreciated.

#### Berlin Motor Carriage Show.

An international exposition of motor carriages will be held in Berlin, Germany, September 3 to 8. The exhibit will comprise, in six classes, motor carriages, freight wagons, motor cycles and trailers, motors and storage batteries, parts and wheels, and motor vehicle sundries. The total show space, including aisles, is 2,700 square meters.

The announcement of the exposition has been made so late that American exhibitors are practically excluded from obtaining good spaces, for it is stated that "intending exhibitors should announce their exhibits as soon as possible, but not later than April 15, either by letter or telegram addressed to the committee as follows: 'Internationale Motorwagen Ausstellung Berlin, 1899, Berlin, Universitat Strasse No. 1.' With the announcement should be remitted half of the rental for the desired space. Applications for space received after April 15 and not later than April 20 will be accorded their due share of whatever space may remain unclaimed on the 15th."

Neither prizes nor medals will be given, but a progressive series of tests, races, etc., is in contemplation, the programme for which will be announced by the committee of management at the opening of the exhibition.

#### Motor Cab Drivers Practising.

Parisians have been mildly surprised of late to see about fifteen electric cabs following one another through the streets of that city at a distance of about fifty meters. Many thought these were the first large installment of electric cabs to be used for public service and as they looked ungainly and somewhat disreputable these mistaken individuals were unduly disappointed. But it transpired that the motor vehicles were simply being used to initiate the drivers or chaffeurs into the intricacies of handling the vehicles in the crowded thoroughfares and were

only practice cabs, the new ones for the use of the public being yet in storage. The latter number 110 and are of four different styles—the landaulet or four-seated cab, open or closed; the ordinary cab for two; the open vis-a-vis and the "trois-quart." The regular fare will be the same as for horse drawn cabs with the exception of the landaulet, for which a charge of 40 cents per trip and 50 cents per hour will be made.

The 110 cabs are all ready for use with the exception of the accumulators, the makers of which have failed to deliver them within the contracted time. These cabs will travel thirty-seven miles at a speed of ten miles an hour without recharging.

The cab company's plant is located in a suburb of Paris and consists of an immense factory building, a power house with engines generating 500 horse-power and running day and night recharging accumulators, a warehouse or stable for 100 cabs, a recharging depot, repair shop and a training ground for drivers.

#### Speed Contest Over Hills.

The week of automobile racing at Nice, France, closed March 24 with a hill climbing contest over a ten-mile course. There were twenty-one starters in the motor vehicle class and eleven in the motorcycle class. The motor vehicle race was won by Lemaitre on the double seated wagon with which he won the mile contest a day or two before. His time over the hill course (24:23) was not only 2:19 better than that made by Giraud, the second contestant to finish, but was 7:27 better than the best previous time made by Michelin over the same course in a steam vehicle. The motorcycle contest was won by Gaetan de Meaulne in 26:47, with Beconnais second and Jacquelin third.

On March 27 Lemaitre made another speed trial alone over the hill course and lowered his previous time to 21:16, attaining an average speed of more than twenty-six miles an hour.

#### Mileage By Waverley Electric.

The Indianapolis Journal makes note of a new pattern of electric vehicles for merchandise delivery purposes of which two have been completed by the Indiana Bicycle Company. The remarkable feature resides in the battery which was tried on a trip through the most hilly and muddy streets of Indianapolis. A distance of 54 6-10 miles was covered before the battery required recharging, says the Journal, but omits to state anything about the load carried. In delivery wagons the load is, however, usually a small percentage of the total weight.

#### Lewis Motor Vehicle Co. Incorporates.

Articles of incorporation were filed at Trenton, N. J., last week, for the Lewis Motor Vehicle Company, with an authorized capital of \$5,000,000, one-half of which is to be preferred stock bearing 6 percent cumulative interest. The objects of the company are the producing of motive-power from compressed air and the operating of vehicles. The incorporators are: Thomas Synnot, Harry A. Berwind, E. T. Postlethwaite, Walter E. Graham, Charles Graham and Harrison Snyder.

Spa, the Belgium bathing resort, will be the center of an international motor vehicle meeting to be held from July 3 to 8. A convention of motor vehicle tourists will be held on July 3 and the next day a road race to Brussels will be run.

Already 116 exhibitors have applied for space in the automobile show to be held next June in Paris.

# Vim Bicycles

VIM, MODEL "30," PRICE \$35.00. EIGHT OTHER MODELS. 30-INCH WHEELS SAME PRICE.

VIM, MODEL "30"—\$35.00 SPECIFICATIONS

**Frame**—Made of 1½-inch Shelby Seamless Tubing. One piece reinforced head. Choice of 21, 23 or 25-inch.  
**Joints**—All flushed, properly reinforced.  
**Fork Crown**—Vim arched, spear-head pattern. Nicked.  
**Crank-Axle**—Fauber one-piece.  
**Cranks**—Diamond pattern, 7-inch throw.  
**Drop**—2½ inches.  
**Sprockets**—Star pattern; front 18 to 30, rear 7 to 10.  
**Gear**—Choice of 68 to 120.  
**Wheel Base**—43¾ inches.  
**Tread**—4½ inches.  
**Wheels**—28-inch.  
**Spokes**—No 2 Excelsior. Swaged, tangent, 32 to front and 36 to rear wheel.  
**Rims**—No. 1. Maple, natural finish or mahogany.  
**Hubs**—Our own make, style "A"  
**Bearings**—All made of tool steel, ground, hardened and polished.  
**Tires**—Our own make; guaranteed for entire year; punctures repaired free.  
**Seat Post**—Flush L pattern, tubular, with tubular saddle bar; very latest.  
**Expanders**—In handle bar; one that will hold. Guaranteed.  
**Chain**—Baldwin, highest grade, 3-16-inch; B block detachable; polished.

**Chain Adjuster**—The neatest out. So arranged that by loosening the axle nut the wheel drops out of frame without disturbing either chain or bearing adjustment.  
**Handle Bars**—27-32-inch; choice of any style made by the Chicago Handle Bar Co.; steel up-turned, dropped, ram's horn, Schin-eeer pattern or steel adjustable, all of the most graceful designs. Octagon tube bars 50 cents additional.  
**Pedals**—Vim, with or without rubbers.  
**Saddle**—Gilliam No. 59, Brown racing pattern, as shown on Model "30," or Gilliam No. 46, Gordon pattern, shown on Model "C," with or without coil springs.  
**Enamel**—Choice of Black, Maroon or Green, delicately striped. We use only the best quality of enamel of highest lustre and durability, four coats; all bright parts heavily nicked.  
**Weight**—20 to 26 pounds, according to size of frame and sprockets used, regularly equipped with tool case, wrenches, oiler and repair kit.  
**Frames**—Our frames are made of the best seamless tubing the Shelby Steel Tube Co. can produce. Built on the most approved lines: short head; 2½ to 3 inches drop to the crank hanger; a strong and rigid frame, graceful in design. Every joint is a steel forging, machined. For strength and rigidity our frames are unsurpassed.

There are positively no stampings, castings or brazed tubes used in these Bicycles. Do not compare our prices with those of wheels so made. We challenge any manufacturer to produce a bicycle of same material and workmanship for less money.

Good Agents Wanted in Unoccupied Territory. We sell SUNORIES cheaper than any house in America. We issue a semi-monthly price list. Catalogue for the asking.....

VIM BICYCLE CO., Inc., CHICAGO, ILL.

# THE PASTIME AND SPORT

## "Turn-Down" Makes Trouble

Reports and inquiries received in Milwaukee during the past few days indicate a fear upon the part of eastern members of the L. A. W. that there will be a split among the pillars of the organization in the west because of what they are pleased to term alarming reports of apparent insubordination. It is true that the friends of President Keenan are incensed because most of the fat jobs went in a way that hadn't been calculated upon. Frank P. Van Valkenburgh, chief consul of the Wisconsin division, has resigned from the committee on rights and privileges, stating in a letter to Keenan that in their conversation at Providence he thought he made it plain that he wanted no national honors and that he is going to have "trouble enough at home" this year. In event of Milwaukee securing the 1900 meet he will have his hands full, he said, and the division needs as much of his time as he can possibly spare.

Frank enough upon the face of it, but there's a story lurking in the background. It was Mears who took hold of Keenan and last fall began to circulate through the country booming him. In the course of his travels he struck Milwaukee and incidentally Van Valkenburgh. The two are fast friends. Van nominated Keenan and Mears touted his campaign, so between them they believed Keenan was "cinched" and that Mears would be chairman of the racing board, etc. But everyone knows the rest and expects there will be nothing but criticism of Gerlach's course in certain quarters.

## The Amateur Rule

The present L. A. W. amateur rule is far more strict than any laid down for the competitors in other branches of sport. This results in an unjust discrimination against the cycling amateurs as compared with the others and works a most illogical disadvantage when the former come into competition with the latter.

There is an agreement among the L. A. W., the A. A. U. and the intercollegiate association for a reciprocal recognition of the amateur standing of the members of the three organizations. The rules and practice of the A. A. U. admit of an "athletic membership" with reduced or no fees, the maintenance of a training table, and the payment of entrance, training and traveling expenses. There is necessarily no open "athletic membership" among the collegians, but the other privileges in the payment of expenses prevail. The L. A. W. amateur rule permits the collegians to train without restriction in all cases and to travel to college meets at university expense, while it recognizes without question the A. A. U. amateurs. As a result we have the L. A. W. not only discriminating between the A. A. U. and the I. C. A. A. men, but granting both of them—the A. A. U. particularly in full—privileges not enjoyed by L. A. W. club or individual riders. Is it any wonder that the latter complain at this discrimination by the L. A. W. against its own riders?

The present rule is a temptation to evasion and the actual violation of the spirit if not the text of the present statute so far as it relates to club racing men is undeniably quite general. It is better that the situation be met and the temptation to underhand violation be removed by an open and above-board rule on the subject. If bicycle riders be called upon

to compete with the athletes of the athletic and intercollegiate associations they should certainly be given equal advantages of preparation and the same privileges in the expense line. Especially is it so when these privileges are reasonable and above all promote that club rivalry in competition which proved in the past such an efficient factor in increasing the interest in amateur racing.

To this end some radical changes from the present L. A. W. law on the subject may be expected in the N. C. A. racing rules.

It is proposed under the new rule to permit of the establishment of a racing membership upon due notice with training privileges and permission to pay entrance fees in club or team competitions; and the payment of traveling, hotel and entrance expenses of riders and teams competing in national and state championships without notice. A further provision restricts representatives of clubs to members of at least thirty days' standing and forbids a rider from representing another club until after a lapse of three months, unless the former club shall have disbanded or gone out of existence.

## How to Save the L. A. W.

A recent weekly L. A. W. membership report of Secretary Bassett showed a drop from the preceding week of 8,000 or thereabouts. The grand total was 65,000 as against 105,000 a little more than a year ago. This is "a condition, not a theory," to be faced by the League. In explanation of the more recent weekly drop quoted it is set forth that this is the membership expiration season and it is hopefully argued that the renewal season will more than fill the temporary gap. But the drop of 40,000 members remains to be explained and, what is more, remedied if the L. A. W. is not only to retain its prestige but its numerical strength and usefulness.

That the beginning of the falling off was coincident with the great racing quarrel that ushered in ex-President Potter's last term and that as the bitterness of the fight increased so was the speed of the falling off in membership accelerated are pointed to by the advocates of divorce of racing as the direct result of the troubles the control of racing has brought the League. Even now that the die of attempted continuance of race government has been cast, such opponents of race control and friends of the L. A. W. as Chief Consul Belding, of New York, openly express the hope that the "outlaws" will soon win, so that the League will be left to the uninterrupted pursuance of its more legitimate objects of good roads and the legal rights of wheelmen.

The L. A. W. owed the real reason of its existence to the battle for good roads. This has practically been won, or at least improved highways have been accepted as a principle in economy and legislation. The establishment of wheelmen's rights, that other cardinal tenet of the L. A. W., has been practically accomplished.

Cycling is older in England and in France than it is in this country, and has passed from fadism to seriousness as is has just done here. Abroad the Cyclists' Touring Club of England and the Touring Club of France have increased their membership and their spheres of usefulness. And how? By merely letting their endeavors run toward increasing the conveniences which

membership in them brings. Is it not, then, in this direction that the L. A. W. must look not only to retain but to increase its present prestige and membership?

President Keenan might well appoint a special committee to learn the pressing needs of wheelmen and provide the conveniences that will make L. A. W. membership of practical value beyond its present privileges and its actual and sentimental participation in the such continuation as may be necessary of the great battles for which it originally enlisted. This way of meeting new conditions cannot be urged too often and too strongly by those who would see the League prosper and grow. N.

## New Fields for "Pot Hunters"

"Pot hunting" professional riders contemplating trips abroad in search of more money and easier competitors than they think can be found at home would do well not to overlook the possibilities of South Africa in this line. "Plugger Bill" Martin, that crafty old roamer, is now in pursuit of the good things the "Rhodes Republic" is said to have on hand for the asking.

The population of Johannesburg and Cape Town is said to have a larger proportion of rich people than any other cities in the world, and they are reported to be lovers of good sport of any sort and willing to pay well for it—how well may be judged from the statement a recent arrival from Cape Town made to a Cycle Age man that the iron stand at the three-and-a-half-lap cement track at Cape Town cost \$80,000. The photograph he had to show of it certainly indicated a very handsome and extensive affair. At Johannesburg, there is also a fine modern cement track. If the purses they stand willing to put up be at all commensurate in value with the costliness of their racing furniture and the attendance warrants the construction of \$80,000 grand stands, it should be a Mecca or an El Dorado for the money chasers.

It might also pay some manufacturers or race showman to send down some pacing machines with a good follower or two, for all the paced records down there have been made behind a 140 lb. Humber quad sent there by the Dunlop people. The African mile paced record stands well up in the "one-forties," a figure cut en route in every middle distance race we run here.

## Gathering at Fountain Ferry.

During the present week the racing men are gathering at Louisville. Fountain Ferry Park track will be alive with racing men before the close of the present week, Bald, Cooper, Kiser, McFarland, Stevens, Gardiner, Fisher, Ziegler, Zimmerman, Gibson, Downing, Freeman, Cotter and many more being headed that way to join Kimble and other Louisville riders. Quarters for all have been engaged at Tony Landenwich's famous hostelry.

Toward the close of their Louisville training season along in the early weeks of May, the men will probably move in a body farther east. The season opens early this year in the east with the N. C. A. meets at Ambrose Park, May 20, and at Newark May 21, and following this is the great Jubilee handicap at Washington, May 24, succeeded by a meet at Baltimore the same evening. Washington will give another meet May 30

with Newark and Berkeley Oval as competitors on the same day. Immediately following this the riders start on their trip along the New York state circuit and the season will then be fairly on and busier than ever.

### GROGNA THE HERO

**Wins Handicap and Scratch Events at Paris Big Opening Fleet—Motocycle Race Draws.**

The first big meeting of the Paris racing season took place on the Parc des Princes track March 26. The attendance was excellent and the entry list large. There were 50 contestants in the handicap and forty-four in the scratch race. Grogna, the little Belgian, who owing to illness ran third to Banker and Tommaselli so often on the winter circuit, was the hero of the day. He won the 1,500-meter scratch race by six lengths from Louvet, second, and Bourotte, third, in 2:08 4-5. This was run after the American style with a single pacemaker starting about twenty yards ahead of the field. Grogna also won the 1,500-meter handicap from scratch in 2:25.

An almost unknown young rider caused much surprise by winning the twenty-kilometer scratch race by a big lead, defeating Bouhours.

Five men started in the twenty-kilometer race, each paced by an electric tandem. The race was very fast from the start and much excitement was aroused when on the third lap Digeon passed Bouhours and steadily increased his lead to the finish. He won in 23:19 3-5, with Bouhours second, Bauge third, Fossier fourth, and Collomb fifth.

There was a twenty-kilometer motorcycle race in which five men started and which was won by Baras in 21:57 3-5, with Vasseur second and Rigal third. It was the first time motorcycles had appeared in a race on a regular bicycle track and the event drew well. The first half of the race was a see-saw, but then Vasseur came up even with Baras and neither could pass the other until the former made a bad turn and lost headway and also the race. Beconnais' machine came to a sudden stop on the third lap and caused the rider to turn a somersault over the handlebars, but he was not injured.

### Suspended French Riders Explain.

The trouble between the French riders and the U. V. F. is quieting down. Jacquelin and Deschamps were both given hearings in which they explained their conduct in having ridden at Marseilles after having been suspended and expressed their regrets. Their terms of suspension were then reduced from three months to one month dating from March 30. It appears that both riders had made application for their riding licenses before leaving for Marseilles but that these were miscarried or wrongly directed and failed to reach the riders before they participated in the races. The suspension of the others who took part in the Marseilles races was reduced one-half.

### Disabled Cycles on Street Cars.

The Springfield (Mass.) Street Railway Company, replying to a petition of the Massasoit Cycle Club asking that disabled bicycles be brought into the city from suburban districts to save the owner a long walk or great inconvenience in getting his mount home by express or otherwise, stated that the charter it holds from the state will not allow it to carry freight; and that the state railroad commissioners must first determine whether bicycles are freight ere the railroad can decide what to do. A petition will there-

fore be formally presented to the state commissioners who will order a hearing to decide the question.

Representatives of the club will appear and show that there is a strong demand for such an arrangement to be made, whereby broken bicycles may be brought into the city from outlying districts, being attached to the rear of the cars, supported by the fenders, where they would discommode no one. It is not thought that there will be any remonstrance to the proposition.

### OPENING MEET IN ENGLAND

**Linton Defeats Chase in Ten-Mile Match With Motor Pacing—Chinn Wins Scratch Race.**

The outdoor racing season in England was opened March 31 with a race meet at Wood Green track organized by the Gamage Cycling Club of London. The most prominent English riders took part in the different events and the meet was well attended. The event of the day was the ten-mile paced match between Tom Linton and Arthur Chase, both paced by petroleum tandems. It was the first public appearance of these machines in London and they created great interest and curiosity. Linton was in splendid form and made one of his greatest races. He gained a lap on Chase and won, finishing in 18:53 2-5, with a fierce wind blowing.

There were fifteen starters in the ten-mile un paced scratch race, in which prizes were offered for every lap. The event was won by Chinn by five lengths in 24:11 1-5, with Gascogne second, Hovard third, Bocquillon fourth and Barden fifth.

The half-mile professional handicap was won by Gascogne from scratch by five lengths over Camp, who finished second from 30 yards. Bocquillon was third and Chinn fourth from scratch. Time, :58 1-5.

The tandem pursuit was won by Wheelock and Fulford in 3:46.

### Nossam Wins in Moscow.

On the first day of the two-days' meet given in Moscow, Russia, March 26, Nossam, the French rider, won the scratch race from the Russian champion, Vachkewitch. The amateur championship race was won by Soukhanoff and the twenty-five-versts paced race by A. Pogojeff. The second day Nossam again won the scratch race, while Wachkewitch defeated Hennisberg (Swiss) in a match race. A. Pogojeff won the professional championship of Moscow.

### Singrossi Wins in Turin.

The finale of the Prize of Turin race was run March 26. Singrossi, who had won his heat on the 23rd in good style, defeated Cornelli, Pasini and Dei in the final. The second scratch race was won by Ferrari, while in the tandem race Angrossi and Dei won.

### Registration to Begin May 1.

The registration of riders in the League of American Wheelmen will commence May 1. After that date all riders will have to be regularly registered with the racing board. The racing board is now taking action on the suggestion that riders in novice races only will not be required to register, and its action will in all probability be favorable to the suggestion. Amateurs who are members of the L. A. W. will have to pay but fifty cents.

The U. V. F. of France, corresponding to the L. A. W. here, has decided to accept as an affiliated organization the Racing Men's Syndicate of France, thus giv-

ing to members of the latter the same privileges as are enjoyed by members of the Union.

### NEWS IN BRIEF.

Angus McLeod has accepted a challenge to race Harley Davidson.

A twenty-four-hour un paced race will be run at Antwerp next June.

The celebrated Buffalo track in Paris, on which Zimmerman made his real debut in Europe is being demolished.

The sixteenth annual Irvington-Millburn road race will be run this year by the Associated Cycling Clubs of New Jersey.

Rigal, the French motocyclist, has established the Italian motorcycle record at 31 miles, 72 yards in the hour, made at Milan.

J. S. Johnson, who is training in Minneapolis, expects to start for California in a week or two, it is reported, to take on some races there.

Lucien Lesna established two African records at Algiers on March 5 covering fifty kilometers in 1:03:14 and riding 29 miles 914 yards in an hour, paced.

A cablegram announced Tuesday that Edna May of the Belle of New York company, now in London, has applied for a divorce from Fred Titus.

A new \$30,000 bicycle track is to be constructed in Nottingham by a strong club with \$50,000 capital. It is expected to make this the best track in England.

Stocks intends to come to America this year, not only to race during the International meet, but to make a business tour of the United States exhibiting his petroleum tricycle.

A meeting of the principal Danish cycling clubs was held recently in Copenhagen and resulted in the formation of the Union of Danish Cycling clubs, which will have charge of the annual international race meets in Denmark.

Amos G. Batchelder, chairman of the board of control of the National Cycling Association, is headed toward Chicago to take a hand in the fight for racing control in the west. He will confer with Greenburg and Root, the local N. C. A. officials, and will then proceed into Wisconsin.

Charles W. Miller sailed Tuesday for Europe, to be gone until September. His first race will be the 100-hour event scheduled to take place at Roubaix, France, starting May 8. Miller has not applied to the L. A. W. for reinstatement, and carries with him an N.C.A. registration card. Mrs. Miller will accompany her husband.

The Olympian Games Company of Buffalo has been organized and incorporated for \$10,000 and has leased Buffalo Athletic Field for a year to be run under N. C. A. control. Several sanctions which have been applied for under L. A. W. rules by some of the local clubs will at once be switched to the N. C. A. list, it is said, and Buffalo will assume a prominent position on the Grand and New York State circuits of that organization.

In a letter from San Jose Trainer Charles A. Ward states that he would like to hear from Tom Eck regarding that fifteen-mile match race between J. S. Johnson and Harry Gibson that was to take place May 30 at Chester Park. If Johnson does not want to take on the race Gibson is willing to race any of the middle distance men for fifteen miles. Ward would also like to match Otto Ziegler against any of the sprinters for mile heats, best two in three. Both riders are fast rounding into form. Gibson is getting large and strong and Ward says will make it warm for any of the middle distance men this season. Ward will leave the coast with Gibson and Ziegler April 15 for Chester Park.

More than usual interest has been excited through the announcement from Washington that a racing team will be organized and liberally supported by the proprietors of the Park Bicycle Club track in that city. The failure of the N. C. T. A. team of last year discouraged the track owners and it was generally thought that the co-operative team plan would never again be tried. J. D. Lasley, the track proprietor, evidently thinks differently. He has his eye on a number of prominent men whose residence will be Washington for the coming season. Of these Owen Kimble is practically decided upon. His probable team mates are unknown but it is stated that Fred Schade, Fred Sims, Will Sims and A. C. Moran, all of whom are from the ranks of the collegians, will be given an opportunity.

## REPAIRING GOLF CLUBS

### Easy Work That May be Made a Source of Profit—Gluing and Lashing—Putting on Heads

Golf is a comparatively new game in this country, its general introduction in America dating back not longer than ten years ago. But in this decade it has become very popular, especially among the wealthier class. Its especial attraction for "the swells" probably lies in the fact that the expenses involved in its pursuit give it an exclusive character that titillates the pride of its devotees. One item in the list of expenses which amounts to a considerable sum in the course of a season is the cost of having the split and broken clubs repaired. On the larger links the work of mending the clubs is generally undertaken by a professional on the grounds at prices gauged according to the "swellness" of the links and club members, but there are links in many small cities and towns where there are no special repairers. In such places there is opportunity for bicycle repairmen to secure this class of work at prices that will well repay the trouble of a special effort to obtain it. A dealer who carries golf goods as a side line and has a repair shop in connection with his store stands the best chance to secure all such work, but any dexterous repairman conveniently located and enjoying a certain amount of prestige may readily work up a good business in golf club repairing.

#### "Winding Under" Ends of Lashings.

Most of the accidents that happen to clubs, both wooden and iron, are of such nature as to be easily repaired if gone about in the right way and will require very few tools. The whole secret of the successful repairing of golf clubs lies in the knowledge and ability to make use of several little "tricks" in winding, gluing and fitting, writes Dudley Parker in Harper's Round Table. Perhaps the most important thing in club repairing to master is the lashing, such as is used in securing the heads of wooden clubs to the shafts.

All the lashings used on the clubs, viz., bindings of grips, broken shafts, etc., are accomplished in the same manner. The lashing proper is simplicity itself—the mere winding of the cord around the shaft—and the only trick lies in securing the ends. This is accomplished by "winding under" the free ends. The free end, for a length of about an inch, is laid along the shaft, as in Fig. 1, and the cord wound closely over it for three or four turns, and then the remaining length of the free end may be turned up out of the way, as in Fig. 2, and the winding continued, as these few turns will be sufficient to hold. The free end is then seized and the loop pulled up tight. The winding will now be a simple matter, the only thing necessary being to see that the turns of the lashing lie smooth and close against each other. Securing the finishing end will be a little more difficult. This is wound under in the same manner as at the start. Make a large loop in the free end and lay the end along the shaft lengthwise toward the beginning of the lashing as shown in Fig. 3, and give the cord two or three turns over it. Then catch hold of the free end and pull the loop up snugly around the shaft against the lashing as in Fig. 4, cut off the free end and the job is completed. It is usual to "settle down" the turns of the cord by tapping it lightly with a hammer.

#### Starting With a Loop.

Another method of winding that is somewhat easier is to lay a loop of the

cord along the shaft and wind backward on it as in the first case. The loop should be long enough so that a small loop remains sticking out after the winding is finished, Fig. 5. The free winding end is then pushed through this loop and by pulling on the slack end of the loop at the starting point the free winding end is drawn down beneath the middle of the lashing, leaving a double loop there. The free ends are next cut off at either end of the winding and the job finished by settling with a hammer.

If when about to wrap a club the cord is pulled through a lump of shoemaker's wax and thickly coated with it and then closely wound on the club, the soft wax will fill in the crevices between the turns of the wrapping and thus render it air tight, thereby preventing it drying out and more than doubling its life. The same result is obtained in the stores by

varnishing the wrappings, but this does not make as secure or as lasting a job as wax. Another point to be kept in mind is, when wrapping a wooden club-head, always start the winding at the smaller end, as this will cause the turns to seat tightly up against each other.

#### Gluing Fractured Shafts.

An important thing in golf repairs is gluing, the success of which will depend upon using only a moderate amount of glue and getting the two parts firmly and closely pressed together. This is best accomplished through the agency of a vise, leaving the two parts to be joined under pressure in it overnight. Before applying the glue be sure to remove all the remains of previous gluings, or, in the case of a broken shaft, those little inequalities produced by the fracture that prevent the two pieces fitting snugly and firmly together. It should be remembered, however, that the best results are obtained by disturbing the broken surfaces of the ends to be joined as little as possible, and only such smoothing down as is absolutely necessary to obtain an

equal bearing of the parts should be attempted.

#### Putting on New Heads.

The putting on of a wooden club-head presents no very great difficulties, but merely requires that care should be taken. The first point is to make sure that the shaft and neck of the head are in perfect alignment, and all that has been said under the head of gluing will apply here. After the head has been set perfectly (this should be done in a vise) it should be left there all night to allow the glue to thoroughly harden, and the next day the club can be taken out of the vise and the little inequalities rasped down with a file so as to present a smooth surface for the wrapping. This rasping down is always necessary on a piece of gluing that has been well done, as the vise should always be so tightened up as to force all the superfluous glue out from between the two surfaces of contact.

#### Treatment of a Split Shaft.

If a wooden club shaft breaks the owner should be advised to replace it by a new one, but an iron club shaft, being of a stiffer nature, is not such a hopeless case and can very frequently be repaired, of course with the exception of cases in which it breaks off inside of the neck. If a shaft breaks off entirely it usually does not pay to bother with it. When a good shaft breaks it will usually break part way through and then split lengthwise, thus giving a long surface for gluing and wrapping. Fit the fractured parts together, having first given them a coating of glue well worked into all the little crevices and leave the shaft in a vice over night to allow the glue to set. The following day sandpaper down all the little inequalities and wrap the shaft at intervals, as shown in Fig. 6. A very good repair can be made by binding the fractured parts, after gluing, with electrical tape in place of the usual whipping, using wrapping, however, at the point of fracture.

#### Tightening Loose Irons.

The principal source of trouble in iron clubs is the loosening of the shaft in the iron neck, usually due to drying out. This can often be remedied temporarily by soaking over night in water, but to effect a permanent cure the head should be reset. Punch the rivet out and the shaft may be removed easily. Then wrap a few turns of twine around the end of the shaft that goes in the neck and put it back again, seating it home with a few gentle taps with a hammer and taking care that the rivet holes in shaft and neck are in alignment. Re-rivet with a soft wire nail of snugly fitting size cut to such a length as to project about a sixteenth of an inch on either side.

In putting a new shaft in an iron the part that goes in the neck is first carefully fitted rather snugly, then given a good coat of glue and seated home by tapping the end of the shaft.

#### Shrinking the Head on the Shaft.

A stronger job can be accomplished by working the shaft down until, when fitted in the neck and given a few sharp taps, it will come only up to about a quarter of an inch of where it ought to come when completed, heating the blade of the head to expand it and then seating the shaft home with a mallet. Then plunge the head into cold water to shrink the neck tightly onto the wood. Heads put on in this manner rarely come loose.

It will not be necessary to explain how to make a grip, as anybody who takes a grip apart, observing as he does so the method of wrapping, will have no difficulty in getting it together again. Glue is a good thing with which to secure the leather and flannel wrappings to the shaft, but care must be taken that none gets on the outside of the leather.

# Excelsior Supply Company's Specialties

## Everything for Bicycle Builders and Dealers

EXCELSIOR SUPPLY COMPANY

(ESTABLISHED 1876)

88-90 LAKE STREET

CHICAGO, ILL., U. S. A.

# SUNSHINE

## AND HOW IT AFFECTS THE DECALCOMANIA BUSINESS.

**T**HE sunshine is streaming in at the window at the moment this advertisement is being written, and it's a sure sign that it's not only streaming into our window but into the life of every bicycle agent and repairman at this time. The past two months have been hard ones, owing to the backwardness of the season, but now that the rush is sure to be on we advise all agents to take time by the forelock and purchase their stock of transfers for the repair trade before the rush is here, for a rush there will be. We can always tell the state of the weather from the amount of correspondence we receive from the bicycle trade.

Repairmen, if you have never yet done any bicycle enameling buy an oven, hang out your sign, and put in a stock of transfers. The oven man will tell you how to run the oven, the enamel man how to bake the enamel, and we will certainly take great pleasure in letting you have samples and directions how to put on transfers. A successful bicycle repairman will so conduct his business that he fills up all spare moments with something to do. Enameling can be done at odd moments, early hours before the rush of callers. The time it actually takes to enamel a bicycle is very slight; the time is consumed in the baking. Any repair shop will find that an excellent paying adjunct to its regular business is that of enameling, and, of course, with every enameling oven a stock of transfers is necessary.

We also sell, in addition to decalcomania decorations, a line of stock name plates which any repairman or dealer can purchase in small quantities and have lettered according as the goods are sold by, repaired by, re-enamelled by, remodeled by, or whatever the case may be.

Our catalogues and samples are free for the asking. Remember in buying our transfers you buy the American-made guaranteed quality. Sketches for special designs submitted free.

## RETAIL MISCELLANY

### General Information Concerning Cycle Agents and Repairmen Throughout the Country

#### California.

B. S. Webb of San Pedro has sold out his hardware and bicycle business to J. H. Hixon & Co.

Hawley Brothers have sold out their hardware business in San Francisco.

#### Canada.

Rogers & Rogers, the "bicycle men" of Summerside, Prince Edward Island, have opened a bicycle establishment, fully stocked, in the McLeod building on Kent street. They will have their fully equipped repair department in charge of an expert, P. G. Armour, who has spent the past winter in the Massey Harris bicycle factory at Toronto, and the sundry and livery department will be in competent hands.

#### Connecticut.

The Plautt-Cadden Co. succeeds the Cadden Cycle Co. in Norwich.

#### Delaware.

Owing to the great increase in their bicycle business, Daniel Ross & Son of Wilmington have added a special department to their store, 210 Market street, for this line. The entire second story of their large department store has been converted into a bicycle and sporting goods department. They are exclusive agents for the following makes: Stearns, Spalding, Relay, Stormer, Monarch, Eclipse, Crown, Imperial and Ross Special.

#### District of Columbia.

The store of the Cleveland Cycle Co. has been gutted by a fire which originated from an imperfectly insulated electric wire in one of the show windows. The flames spread rapidly, damaging a large portion of the show rooms and the stock of bicycles. The building was damaged to the extent of \$1,500, while damage to the stock will be more than \$2,000.

#### Florida.

The Tampa Harness & Wagon Co., Tampa, will handle bicycles this year and has taken on the Featherstone and Olive lines.

E. D. Hobbs & Co., of Tampa, large buggy dealers, will carry a side line of bicycles and have selected the Monarch as their leader.

#### Georgia.

Askew & Bradley of Hogansville have dissolved partnership.

#### Illinois.

O. L. Putnam is making preparations to open a bicycle repair shop in the basement under McKinstry Brothers' store in Harvard.

George Decker has rented a building in Rock Falls and will open a bicycle shop soon.

Bohner & Son have opened a new bicycle establishment in Oregon. The firm's leaders are the Eldridge and Belvidere bicycles. The Sherman and Stone are also carried in stock.

W. A. Schmitz has opened a bicycle repair and supply shop at 219 National street, Elgin. He will also manufacture and store machines.

C. H. Barrett, a machinist of Benton, has taken a partner and the firm is now Barrett & Biggs.

Charles T. Schelling succeeds P. T. Sprecher in the hardware, harness and bicycle business at Leaf River.

#### Indiana.

Jay Parkinson has opened a bicycle repair shop at 713 Indiana avenue, LaPorte.

M. D. Jones has purchased Mr. Wysong's interest in the bicycle business of Jones & Wysong and is now in the Opera House block on Brick street. He carries a complete line of machines and a large stock of sundries, and makes high grade repairing a specialty.

Fred McCullom has opened a bicycle and repair shop on Mechanic street, Valparaiso.

The Erie Cycle Co. has established an up-town store at Twelfth and Meridian streets, Anderson.

#### Iowa.

E. E. Brown's bicycle and repair shop was burned out in a big fire at Keota. The contents, however, were saved.

A. N. Highley of Allerton has advertised to close out his stock of hardware and bicycles.

The Jones Hardware Co. of What Cheer has been damaged by fire.

C. W. Leonard of Brooklyn has taken a partner. The new firm is Leonard & Drake. They handle hardware and bicycles.

Firkin & Nelson of Roland have dissolved partnership. M. O. Firkin will continue the business.

H. Dillon & Co. have bought out the hardware business of Mrs. E. Bayne at Martinsburg.

The hardware firm of Shrock & Zarger, Pandora, has been changed to Zarger & Denton. They deal in bicycles.

Isham Brothers & Colyer have gone out of the hardware and bicycle business at Walker. Archibald & Lamb succeed them.

#### Kansas.

W. J. Keyes, who was in the bicycle business in Hutchinson last season, has accepted a position with the Hutchinson Hardware Co. and will have charge of their bicycle department.

#### Maine.

The Old Town Bicycle Co., F. H. Hart, manager, has opened its place of business on Main street, Bangor. This company will carry a complete line of bicycles of all grades. One of the special machines which this company sells is the Eclipse with automatic coaster and brake.

The Bangor Bicycle Co. has opened a branch store in Bangor at 230 Hammond street. Jerry T. Carrow is manager and a full line of bicycles and bicycle sundries will be kept on hand. Special attention will be given to renting bicycles and experienced workmen will be in charge of the repairing.

#### Massachusetts.

J. C. Gilbert has opened a bicycle store in Abington.

J. W. Merriam has opened his bicycle school, corner State and Market streets, Springfield, for the eighth season. He has given more than 11,000 lessons in the last seven years.

#### Michigan.

Rechlin & Frank have opened a bicycle store at the foot of Center avenue, Bay City.

George Pendleton has leased a small building in Albion and will open a bicycle repair shop.

S. Seney is the proprietor of the Baw Beese machine and bicycle works at 68 Broad street, Hillsdale. Bicycles are made to order. Mr. Seney claims to be the only machinist running a shop in that territory.

H. E. Gibbs of Traverse City has added an electro plating branch to his bicycle business.

H. M. Stevenson will occupy a store in the new Fogarty building, Escanaba, with a stock of jewelry and bicycles.

#### Minnesota.

R. A. Costello succeeds M. R. O'Neil in business at Graceville. Hardware and bicycles are the goods carried.

Oleson & Eveans of Ulen have dissolved partnership.

#### Mississippi.

The Jackson Cycle Co., Jackson, are agents for about ten of the leading makes of high grade bicycles. They are increasing their stock of sundries and supplies and are entering into the jobbing business in a small way. They are prepared to do repairing for the smaller dealers and make a specialty of out-of-town work.

#### Nebraska.

S. N. Wolbach & Co. have gone out of business in St. Paul.

#### Nevada.

Isaac Olcovich, the proprietor of a dry goods store in Carson which carried bicycles as a side line, is dead.

#### New York.

Victor Wiss has opened a bicycle store in Morristown.

S. H. Conklin has added a bicycle department to his store in Richfield Springs.

Arthur M. Butts has removed his entire stock of bicycles, wagons, harness, guns, etc., to the Mendel block, Oneonta. The repairs already made to the store include new and larger plate glass windows, new shelving and fixtures and new paint and varnish throughout.

C. L. Brainard has purchased the bicycle business of F. D. Hatch and will open a store for the repair, rent and sale of bicycles.

Jesse Wright of Fulton has sold his stock of hardware to A. J. Snow, and will occupy the ground floor of the Patterson block with his bicycle repair shop.

C. C. Bradley & Co., jewelers and bicycle dealers of Batavia, have dissolved partnership.

Adam G. Robson of Camden has sold out his hardware and bicycle business.

The name of the Power City Bicycle Co. of Niagara Falls, has been changed to the Niagara Bicycle Co.

#### New Jersey.

The Bridgeton Cycle Co., Bridgeton, has re-arranged their store and removed all their repairing work to the second floor.

#### Ohio.

H. F. Grimmssey of Warren has reopened his bicycle department at Brooks' hardware store.

Mr. Gillum has retired from the firm of Gillum & Spetnagel of Chillicothe and the firm is now the Spetnagel Hardware Co.

J. E. Swank, a bicycle dealer of DeGraff, has moved to Sandusky.

J. W. Brumbaugh succeeds Spittler & Brumbaugh at West Milton. Bicycles are handled as a side line.

Hy Fricke of Cecil has bought the bicycle business of Chas. K. Bristol.

#### Pennsylvania.

O. H. Dietrich has opened his new bicycle store at 142 North Seventh street, Philadelphia, in a building which has been remodeled and turned into a handsome store room. His stock is all new. The sundry and repair departments are complete.

Jack L. Straub of Lancaster retires from the jewelry business and will deal in bicycles and bicycle sundries exclusively. He will move his store to 50 West King street.

E. M. Newell and Chester J. Langdon of Huntingdon will again occupy the Blair building on Penn street as agents and repairers of bicycles.

R. Bruce Fleagle, who had a bicycle store in Carlisle before going to the war, has opened a new store on East Main street. He will handle the Wolff-American as a leader and will also sell some cheaper grade machines. He will carry a fine stock of sundries and will do all kinds of repairing.

#### South Carolina.

Byar & Carmichael of Marion have recently opened an up-to-date repair shop. They will handle the Rambler and Olive lines.

J. D. Strange, Plain street, Columbia, has recently disposed of his stock of bicycles and sundries.

McCants & Quattlebaum, Greenwood, have just opened a shop for the repairing of bicycles.

J. F. Cox will soon engage in the bicycle repair business at Darlington.

#### South Dakota.

Jacob Isaak & Co. succeed Mewink & Isaak in the hardware and bicycle business at Eureka.

#### Tennessee.

The Vance Hardware Co. succeeds Vance & Kirby in the wholesale hardware and bicycle business at Chattanooga.

#### Texas.

J. H. Smith & Co. of Dangerfield have dissolved.

#### West Virginia.

G. W. Smith has sold out his hardware and bicycle business at Buckhannon.

#### Wisconsin.

W. Weselsky has moved his bicycle repairing shop from 1281 Main street, Green Bay, to Thomas' sporting goods establishment on Pine street.

J. W. Warnken has taken the Milwaukee agency for the Thistle bicycle and will shortly open an emporium on the east side. Trade in Milwaukee is beginning to pick up and the roads are in fair condition.

Otto Spengler and Albert Fritsch have opened a bicycle emporium in the Buchman building at Hortonville. Besides having bicycles for sale, they are making preparations for all kinds of repair work.

J. I. Steves of La Crosse has added some new lathes and other machinery to his bicycle shop on Caledonia street.

Frank Bonnis has opened a bicycle repair shop in Tigerton for the coming summer.

Smith Bros. of Durand have gone out of the hardware business.

C. M. C. Taylor, who was in Beaver Dam last season, will resume the bicycle sale and repair business and will open up with a large supply of new machines and repair parts of all kinds.

# CYCLE ADVERTISING

Vol. XXII. No. 24.

THE CYCLE AGE OFFICE.

April 13, 1899.

## ADVERTISING ADVICE

### Careers of Those Who Do and Who Do Not Advertise.

The Chinese are very superstitious. When there is an eclipse of the moon they believe that some fiery dragon, with green eyes and yellow mane, breathing liquid fire, is eating the silvery orb like a hobo at the pie counter.

Then they get out all the old tin cans and brass cymbals and kettle-drums, and hold a pow-wow, as if it were the last night of an L. A. W. meet.

This is to scare off the untamed dragon and make him disgorge the moon.

But, somehow, the eclipse goes on as scheduled. There is no change in the program.

There are a whole lot of superstitious bicycle men. They don't believe in advertising, as a general thing. They manage to do a little business, taking things philosophically, blaming the weather, condition of financial market, the coming election, or the fact that the Great Swat of Ashantee has an ingrowing toenail.

One of these days the Cycle Age makes it plain to them that some up-to-date concern is pushing ahead and securing more business than formerly.

Immediately there is a great to-do among the superstitious. They believe that there is to be a business eclipse. They are going to be darkened entirely. They didn't care as long as these fellows were shedding moonlight by jogging along in the same style as themselves, but now—there would be no chance at all for them. They won't do enough business to keep up current expenses.

Then these superstitious merchants commence beating their tom-toms, to scare away the trade from the merchants who are constant advertisers.

They get out all kinds of dodges, and spoil white paper with green and yellow paint, and talk about bargains and whole trainloads of goods for sale at cost, etc.

But the noise doesn't have any effect. The business eclipse goes on just the same.

People have learned to rely on Smith and Jones, the steady going advertiser, just as they have on the movements of the planets.

When Smith or Jones says he is going to do a thing, he does it, just as when the good old green-covered almanac says that the moon is going to be eclipsed, it is eclipsed.

If you don't want to be eclipsed get into the light of publicity at once.

Don't try to get there during an eclipse, for it will be pretty dark then.

If you get in now, and stay there, people will know you are there, even if your competitor does go you one better for a

week—next week you can get even with him.

That's the life of trade. If you advertise at all, advertise steadily. Don't plunge once a year—take small doses all the year round.

### Case Hardening Conundrum.

A number of replies have been received to the Cycle Age's offer of a suitable prize to any correspondent who would send particulars of a suitable method of case hardening for use by repairers and in small shops generally. Without exception the correspondents recommend the use of either prussiate or cyanide of potassium, which have been used by machinists for years as the only available methods of case hardening mild steel in small lots, but which give only a thin and slightly serviceable shell of carbonized steel.

Mr. J. B. Ferguson, of Princeville, writes: "Procure an ordinary piece of gas pipe, of size and length to accommodate the piece to be hardened; plug one end tightly with asbestos paper and drop in the pieces to be hardened with sufficient prussiate of potash to cover all when shaken down. Roll up another piece of asbestos and plug tightly. Lay in a clean fire and keep at a cherry red heat for from thirty minutes to two hours, according to the quality of the job required. When taken from the fire hold with heavy tongs and punch out plugs and all into a tank of water while the gas pipe is at red heat. If the thing is properly plugged no gas will escape and the parts will come out clean and of a nice gray color."

Mr. Ferguson's plan would give better results than any other suggested, but on account of the time consumed a regular bone meal case hardening method might as well be employed.

I thank you very much for the Modern Cycle Repairs; I can assure you it will prove very useful. I thought I knew considerable, but find I am not the only pebble. It will save lots of time taken up in showing and explaining, as any man can look up the book without taking the time of the boss and with just as good results.—John Capp, Buffalo.

## POINTS FOR LOCAL ADS.

### Stolen Bodily from the Bulletin Issued to Agents by the Western Wheel Works.

Do not try to crowd in too much matter in your space. A few words in a fair sized space is much more attractive than a volume of matter in a small space.

In stating prices do not use the ciphers indicating cents. \$25, \$30, \$50, stand out much plainer than \$25.00, \$30.00, \$50.00.

Do not repeat your ads. too often. New food for thought is as desirable in advertisements as in a boarding house bill of fare.

A slipshod ad. is too apt to indicate a slipshod store. Your ads. should make a good impression.

Do not plunge in your advertising. Better do a little for a long time than a lot for a short time.

A border sometimes brings out an ad.—separates it from other ads.

The names of your goods should be in larger type than your own name. Remember you are offering CRESCENT BICYCLES for sale, not Smith, Jones & Co.

It is advisable to use a cut of a bicycle in connection with your advertising whenever possible to do so. They attract attention. Do not use last year's cuts in advertising this year's models. Be up to date.

In writing an advertisement you should be clear and concise, but do not make it so brief as to have your announcement misunderstood. A paper once contained this ad.:

"Bulldog for sale; will eat anything, very fond of children."

It is doubtful whether the ad. brought a customer.

Modern Cycle Repairs is just the thing for any repairman. Many of the articles in it are each worth more than the price of the book. Would not part with mine if I could not get another.—J. J. Good, Upper Sandusky, Ohio.

I feel that I can truthfully say the Modern Cycle Repairs is the best work ever gotten out, and every man, either mechanic or cyclist, should by all means possess a copy.—Geo. M. Ross, Washington.

Modern Cycle Repairs is at hand and I must say it is the finest thing of its kind I ever saw, and no repair shop should be without it.—Jno. Dutil, New York.

"Modern Cycle Repairs" is the title of a hand-book published by the Cycle Age Company, of Chicago, containing illustrated descriptions of economical workshop methods for repairing bicycles and their equipment. The repair man will find it a useful reference in the equipment of his shop, but more so in the study of remodeling and assembling wheels. Hints are given on the art of enameling, with miscellaneous suggestions, as to the different parts of a bicycle. The work comprises 130 pages, well printed and bound.—Iron and Steel.

## A GOOD AD. FOR A BICYCLE AGENT.

**"For That Tired Feeling"** Your System Needs a Spring Tonic.

**R** Take one bicycle—the best; to be used in homeopathic doses until cured.

It is essential that you buy **The Blank Bicycle** to secure the best results—easy running and absence of danger. It is pre-eminently the best bicycle of this territory. It has the prestige, the sale, the confidence of the rider. It is the easiest bicycle to ride because it is the best bicycle. It is not the best bicycle because it is turned out cheaply and sold at a low price, but because years of use have proved it to be unexcelled. :: :: **We have but one price to all, and that is the lowest—considering quality.**

# INFORMATION FOR BUYERS

## THE SECURITY CYCLOMETER.

One of the causes which has led many riders to discard their cyclometers, much against their inclination and desire, is the fact that they are easily broken off when the bicycle is put into a rack or stacked in a pile with others, or become bent so that the trip does not engage and the record is lost. It sometimes happens also that mischievous persons bend the cyclometers out so that the trip will not engage.

Having in mind these objectionable features of the cyclometer in general, the New Departure Bell Co., of Bristol, Conn., has perfected and placed on the market the Security cyclometer shown in the accompanying illustration. The cyclometer proper is

mounted inside of the spokes on the hub, the star wheel projecting outward between the spokes, but not far enough to catch or be hit by anything. The trip is mounted on the axle inside of and behind the fork, thus being entirely out of the way and out of sight.

It will be noted that this construction at once removes all source of danger to the instrument and affords the rider means for keeping his mileage correctly without danger from breakage or mischievous handling, as if the cyclometer is tampered with it immediately is apparent. The New Departure Security cyclometer is made entirely of the best materials obtainable, and the workmanship is of the highest order. Every gear is machine made and finished accurately to gauge. No soft metals or cast parts are ever used, but on the contrary none but the best hard brass and special nickel silver (which gives the peculiar non-corrosive quality to the New Departure cyclometers) enters into its manufacture. The trip is noiseless, and the whole outfit has an exceedingly small, neat, and symmetrical appearance, the cyclometer being one of the smallest ever put on the market.

The Security cyclometer is marketed by John H. Graham & Co., 113 Chambers street, New York city, who are general selling agents for New Departure products, or will be mailed to riders on receipt of advertised price by The New Departure Bell Co.

## FOOTE SINGLE TUBE TIRES.

D. F. Foote & Co., 270 Euclid avenue, Cleveland, are manufacturing a single tube tire which, while unguaranteed and sold at a very moderate price, is recommended as a very satisfactory tire of that character. By devoting all its energy to the production of this one pattern of tire the company is able to produce an article much more reliable than the average tire sold at the same price. This is the second year of the tire's manufacture. The company's factory is at Erie, Pa. The firm of Collister & Sayle of Cleveland has handled the tires since their introduction and reports very favorably upon them.

## UNIVERSAL PRICE LIST.

Dealers and repairers buying from supply houses have been much inconvenienced in the past by the varying discounts of the different firms, which makes the figuring out of net prices somewhat of a task. The Bicycle Repairers' Tool Co., 84 West Washington street, Chicago, is issuing to the trade a list of all standard fittings, materials and sundries, the correct net prices of which may be obtained by deducting a uniform discount. In compiling this list the company figured out the net prices of all the different prod-

ucts included and then raised them to list prices, from which a uniform discount if deducted would yield the correct net prices. The list contains no illustrations, being a straight price list intended to save the buyer many inconveniences and mistakes during the course of a season. To it is appended a complete list of the repairers' and machinists' tools and supplies made and handled by the Bicycle Repairers' Tool Co.

## H. B. ADAMS BALL BEARING CO.

The H. B. Adams Ball Bearing Co. of Philadelphia, Pa., was incorporated last week, capitalized at \$500,000, and has opened offices in the Witherspoon building, corner of Walnut and Juniper streets. This company is formed to manufacture anti-friction ball bearings for trolley cars, engines, shafting, machinery—in fact, ball bearings for everything to which they are applicable and on which they are desirable, but at present is making a specialty of carriage, motor vehicle and bicycle hubs. It is understood several prominent Philadelphia capitalists are interested in the company.

They have acquired valuable rights, including the well-known Lake patents, of which they have sole control. They have also purchased the hub and crank hanger business of H. B. Adams.

H. B. Adams is president of the new company. He is well known in the trade as an expert on the construction of ball bearings, besides being the manufacturer of the famous Lake hubs. He claims that hubs for automobiles constructed under his design and the Lake patents will save nearly 25 per cent of the power necessary to run them with ordinary hubs. This company will have something interesting to manufacturers of horseless carriages as well as bicycle makers.

## BARGAINS IN TIRE FLUIDS.

The Tireine Mfg. Co., 514 Central avenue, Cleveland, which has been manufacturing tire fluids exclusively since 1894, is making a special offer of a sample order box containing packages of Tireine, Ideal puncture fluid and the company's special vulcanizing liquid. The box is offered at an extremely low rate in order that it may act as a salesman for future orders and thus gain wide notoriety for the goods without the usual introductory expense of traveling men. The company is doing a first-class business, the orders already taken being said to be equal to the entire output last year. The trade is also notified that the firm will protect its customers against possible infringement suits by parties claiming broad patents on puncture healing compounds.

## ROLLER GEAR WITH POINT CONTACT.

The Spinroller Company of Rochester, N. Y., supplies manufacturers with the Spinroller gear and its connections, including

in comparison with other chainless gears are explained. From this pamphlet the following passages are quoted:

"The gear consists of two sets of inter-meshing rotary roller teeth, each tooth curving inwardly towards its axis. The rollers are supported at their outer ends by a finger-like plate which holds them rigidly, and prevents them from springing in the slightest degree when pressure is placed upon them.

"The Spinroller gear is so constructed that when one roller rolls against the other the working surface is in point contact, and for this reason will stand a wide degree of deflection. All chain troubles are abolished; no noise; no jar to the feet; minimum of friction is reached, consisting only of contact of the rollers, which, instead of rubbing, turn each other slightly in opposite directions.

"It should here be remembered that other gears of the roller type are made up of rollers revolving on studs supported only at one end, and very unstable to resist heavy driving without bending. In the Spinroller

gear this defect has been entirely overcome by supporting the studs at their outer ends, and it is impossible for them to bend, even under the heaviest load. All the objections, such as backlash, variable ratio of velocity, roughness, etc., have been overcome with one stroke by designing the contour of the rollers with a generated curve. The curved surface of the rollers of a Spinroller gear has been determined mathematically, and for this reason the Spinroller gear is a new and wide departure from the old crude and undeveloped face gearing."

Favorable opinions of Prof. C. W. McCord of the Stevens' Institute of Technology, Prof. Carpenter of Cornell University and Prof. Archibald Sharpe of Central Technical College of South Kensington, England, are cited, the latter authority stating, according to the pamphlet that: "The adaptability and flexibility of the Spinroller gear exceeds that of any other mechanism for cycle driving. This is a property of immense practical importance, which should make it find favor with assemblers and component makers. In case of an accident causing distortion to the frame, the great adaptability of this gear is a most valuable feature."

The accompanying illustrations show the

crank hanger, dust cases, driving shaft and rear hub, and has published a pamphlet in which the advantages of the Spinroller gear

construction of the gear and the fittings as supplied to the trade. It will be noticed that the casings are provided with transparent

McELROY COASTER BRAKE PATENTED.

The accompanying illustration shows the construction of the backpedaling brake and coaster which the Frank E. Bundy Lamp Co. of Elmira, N. Y., has undertaken to market for George E. McElroy of the same place to whom letters patent were granted last week on the device. In this coaster and brake the rear sprocket is carried in a bearing formed by the annular groove left between two collars screwed onto the hub with right and left threads and having fiber friction discs on their perpendicular faces. The inner periphery of the sprocket is undercut with wedge shaped recesses in which engage spring actuated dogs seated in recesses on

the inner collar. When the sprocket is given a forward impulse through the chain these dogs engage one of the clutch teeth and the hub revolves with the sprocket, but when the wheel is in motion and the sprocket is stopped, the hub continues to revolve the dogs clicking past the clutch teeth.

The outer face of the sprocket wheel is provided with three in-cut radial clutch teeth which engage with three similarly shaped outward cut wedge bearings on a rotary disc plate whose outer face has three recesses in which are situated spring actuated dogs that engage with a series of clutch teeth cut in the inner face of the outer collar. This stationary disc plate is held against revolving by an extension of its flange (covering the mechanism) which is attached by a clip to the rear fork as shown in the middle cut. The outer face of this stationary disc normally bears lightly against the outer friction disc on the inner face of the outer collar which revolves with the hub.

When the sprocket is moving forward to drive the wheel the rotary disc plate or ring engages with the sprocket and is carried around with it, the spring pawls in its outer face clicking past the clutch teeth in the stationary ring, but when the sprocket is given a backward motion the dogs engage with these teeth and the rotary ring becomes stationary while the sprocket moves backward on the wedge shaped teeth on the inner side of the ring and is forced inward against the friction disc on the face of the inner collar while the outer face of the stationary disc is forced against the rotating friction disc of the outer collar and a double acting braking force is applied, regulated of course by the backward force put on the rear sprocket. The patent also covers the use of balls in place of the spring actuated dogs.

PACKAGE CARRIER AND MUD GUARD

The Aetna Mfg. Co., 225 Dearborn street, Chicago, is introducing an attachment for

bicycles which combines a parcel carrier and rear wheel mud guard. The attachment is made from nicked rods and rubber bands and fastens to the rear stays of the bicycle frame. The horizontal top frame is expandible laterally so that it may be opened out to accommodate packages of different sizes.

When closed the side rods and the intermediate flat rubber bands form a mud guard over the wheel. The carrier is sufficiently strong to support fifty pounds of baggage and will accommodate any bundle not larger in diameter than eighteen inches. It can be attached to any bicycle without special tools or appliances and can be adjusted to its different positions and for its varying purposes without the slightest difficulty. The company strongly recommends the carriers for use by members of military cycle organizations.

THE LEFEVRE WHEEL TRUER.

The LeFevre wheel truer, of which announcement is made on another page of this issue, is one of several devices offered for sale by the LeFevre Mfg. Co., of Philadelphia, Pa. The truer is a most clever piece of mechanism. With it any amateur can true his own wheel in short order and with perfect ease. It is a midget in size; no larger than a cyclist's oil can.

This company also manufactures a cycle stand with which forty different positions of the machine can be obtained, and which retails at a popular price and is proving a leader.

THE "YANKEE" CHAINLESS MACHINE.

A. R. Justice & Company, manufacturers of Silverware cutlery at 718 Chestnut street, Philadelphia, are placing upon the market a chainless bicycle to be known as the Yankee, the invention of E. C. Doolittle, of Philadelphia, who has assigned one-half of his patent rights to Mr. Justice. The contours of the finished machine are shown in the accompanying half-tone and the gear mechanism in the line drawing. The machine is propelled by cranks in the usual

manner. A four and half inch pinion is mounted on the pedal shaft, the teeth of which engage the teeth of an internal gear wheel. This transfers the motion to a one and a half inch pinion mounted on a shaft above the pedal shaft. On each side of this upper shaft are placed dust proof ball-bearing, adjustable eccentrics, which are connected by rods with corresponding eccentrics mounted on the hub of the rear wheel. The internal gearing is covered with a dust proof case, which snaps on each side like

a watch case. It is placed in the center of the frame, which affords the best possible protection to the gear in case of accident. The eccentrics are set at quarters, so when one is on dead center the other is at its best pulling point. The eccentrics mounted on the hub and the connecting rods are protected by the rear and side stays of the frame. The tread is four and three-quarter inches, gear eighty-four, weight twenty-nine pounds, which can be materially reduced.

STEARNS CUSHION FRAME BICYCLES.

E. C. Stearns & Co. of Syracuse, N. Y., have issued a special circular presenting the merits of the Stearns cushion frame models. The folder contains six pages of carefully compiled and well illustrated matter relative to the construction, utility and exterior appearance of these machines. Detail views of the various parts comprising the completed cushion device are also shown and described.

THOMAS HUBS AT PARIS EXPOSITION

J. P. Thomas & Co., 439 to 443 Thirty-first street, Chicago, report a satisfactory demand for the new Thomas hubs and hangers and state that they are making preparations to increase their facilities for manufac-

turing. The bearings, as shown in the accompanying illustration, are of an entirely new construction and were devised to reduce friction as much as possible. The axle carries a cone much the same as in the ordinary hub; surrounding the axle is a sleeve upon the ends of which are mounted two bearing rings, one forming the cup for the axle bearing while the other acts as the cone for the outer bearing, the cup of which is screwed into the barrel as in an ordinary disc adjusting hub. After the parts are assembled and the adjustment made, the cone on the axle is locked. The cup in the

barrel is then adjusted after which a dust cap is slipped over the axle to take the place of a washer against which the lock nut is tightened. Outside this and fitting over the axle is another dust cap which fits the inside of the barrel end. It is secured from turning around the axle by means of a small projection fitting in a groove which runs longitudinally along the axle as shown. The arrangement of parts is such as to almost exclude dust; in machines that have been run for a season, dust was found to have worked in between the outer cap and the inner ring, but had not entered the bear-

ing proper. This feature is attracting attention, especially as there are no felt washers used in the bearings.

Mr. Thomas has been in correspondence with the managers of the American department of the Paris exposition and has about concluded to make an exhibit. He will arrange a display of sets of hubs, hangers, etc., suitable for single and multipler machines and will endeavor to have his invention brought as prominently before the French and continental makers as possible. He may not be able to visit the exposition personally but will have a representative there who will be thoroughly conversant with the business.

Mr. Thomas recently shipped large orders of goods to Philadelphia and San Francisco.

**INCREASE IN FACTORY SPACE.**

The Union Drop Forge Co., 64 East Ohio street, Chicago, is building a brick addition to its forging plant that it may keep abreast of its constantly increasing business. The addition when completed will give the company 3,125 square feet of added floor space. Changes are also being made in the office to increase the facilities for taking care of customers.

**LEAGUE ADJUSTABLE BAR.**

The League Handle Bar Co., 215 South Clinton street, Chicago, besides making a large assortment of rigid handle bars of popular patterns, is introducing its new adjustable bar in which the bar tube is locked to the stem in any desired position by the same bolt which operates the wedge expander for binding the lower end of the stem to the wall of the fork stem of the bicycle. The bar passes through a transverse, semi-

circular, corrugated opening in the stem head and engages a matching semicircular groove in a snugly fitting lug in the upper end of the stem. The expander rod passes through this lug or clamping block which furnishes a binding surface for the expander rod nut. When the rod is turned for tightening the clamping block presses downward upon the handle bar and locks it securely in position. The company furnishes all of its bars with expanders if desired and supplies

both bars and seat posts either nicked or unfinished. Handle bars will be made from brazed tubing in contract lots.

**BOTTOM PRICE REACHED.**

By an error in the Pope Mfg. Co.'s advertisement which appeared in the last issue,

**BEAN-CHAMBERLIN MFG. CO.'S COMPLETE LINE.**

The illustrations above show the eleven models of Hudson, Lenawee and Noxall bicycles manufactured by the Bean-Chamberlin Mfg. Co., of Hudson, Mich., and the construction of the company's one-piece hanger made under Fauber patents. Model 30 is the 3-crown Hudson roadster with 30-inch wheels. It sells at \$60. Models 40 and 41 are the standard \$50 Hudsons in men's and women's patterns, and Models 28 and 29 are a pair of Hudson bicycles retailing for \$45 each. There are four Lenawee patterns. Model 34 is a 30-inch and Model 32 is a machine designed for the road racer and scorcher. The retail price of each of these is \$45. Lenawee Model 24 and the corresponding women's machine, Model 25, are designed to meet popular requirements in \$40 machines. The Noxall is made in both men's and women's patterns. No retail price is made on these machines, a net price being quoted to dealers who are at liberty to make their own list prices to suit local conditions.

### HARRIS FITTINGS CATALOGUE.

B. E. Harris & Co., 71 West Washington street, Chicago, have just issued one of the neatest and most complete catalogues of materials and sundries they have ever published. On the colored front cover is an artistically executed portrait from a painting reproduced by the three-color process. The catalogue contains illustrations and brief descriptions of the materials handled by the firm and also a large list of sundries and small specialties. Frame sets are offered in several patterns and built-up frames and stripped bicycles are listed for the benefit of those repairers and dealers who do not care to erect their own frames. Two models of complete bicycles built from Harris fittings are shown by full page half-tone illustrations in colors. The company makes a specialty of fittings for juvenile bicycles.

### DEXTER LUGGAGE CARRIERS.

One of the many forms of luggage carriers made by the Dexter Mfg. Co. of Troy, O., is shown in the illustration herewith. The carrier shown comprises two adjustable

straps attached to the handle bar by suitable and readily applied clips. Almost any form of package or bundle may be held in the carrier. Other forms of carriers supplied by this firm include a carrier for attachment to the rear of the bicycle frame, a steering head carrier in the form of a canvas school bag, and a handle bar carrier with wire frame to support the load and straps to secure it in place. The carriers all retail at reasonable prices and dealers may obtain liberal discounts by writing to jobbers handling the goods.

### KEY RING NIPPLE GRIP.

The accompanying illustration shows one of the latest specialties brought out by the Buffalo Specialty Co. of Buffalo, N. Y. It is called the Baby nipple grip and is designed as a practical grip which can be conveniently carried in the pocket or on the

key ring. Its retail price is low and this, coupled with the attractiveness, and readily recognized convenience of the grip, makes it a good seller. The jaws are tapered to fit any nipple and are well hardened so that there is practically no possibility for the grip

to wear out. Dealers may obtain the Baby grip in two-dozen lots mounted on counter display cards.

The Whitely Steel Co. of Muncie, Ind., has removed its Chicago offices from the Fisher building to the Marquette building, corner of Adams and Dearborn streets.

## DUNLOP TIRE PATENTS SAFE

**Hundred Thousand Dollar Investment is Protected by the Court—Story of the Legal Encounter.**

Messrs. Brown and Stillman of Syracuse, Charles Metz of Highlandville, Mass., C. K. Welch of Coventry, England, and Charles F. Roth of Cincinnati, all claimed to have invented, within a short period of each other, what is now known as the Dunlop tire. The Dunlop Pneumatic Tire Co. of London owned the Welch application. The interests of Brown, Stillman and Metz were combined in a partnership arrangement and were bought up by the Dunlop company, and in due course the patent was issued to Brown and Stillman and became the property of the American Dunlop Tire Co.

### Beginning of the Litigation.

Shortly afterwards the American Dunlop Tire Company entered suit against the Phelps & Dingle Mfg. Co. for infringement, and the latter put in as part of their defense the Roth application which they in the meantime had bought. This litigation ended in a victory for the Dunlop company.

Some years later Mr. Phelps and Mr. Dingle of the above mentioned company entered the employ of the New Brunswick Rubber Co. Mr. Phelps called upon Kirk Brown, manager of the American Dunlop Tire Co., and tried to sell him the Roth interference. Mr. Brown, however, absolutely refused to consider the proposition at any price.

### Roth's Claim is Transferred.

Through the exigencies of business Mr. Phelps afterwards assigned the application back to Roth, so that it could be in turn sold to the New Brunswick Rubber Co., which firm came into possession of it. Mr. Phelps received no compensation whatever for this transfer.

The New Brunswick Rubber Co. thereupon pressed the interference, with the hope of nullifying the value of the Dunlop patents for which the Dunlop company had paid \$100,000. The matter has been dragging along in the patent office for a long while and has now been decided in favor of the American Dunlop Tire Co. by a decision of the patent office throwing out the Roth application.

### "Good Old Days" Eclipsed.

Milwaukee, April 17.—Less than three weeks ago there was nearly a foot of snow on the ground here, but today the grass is green, the trees are budding and the roads dry and in excellent condition. This has operated to throw an unprecedented volume of trade to the dealers. There were rush times in the "good old days" of '95 and '96, but the wildest dreamer never thought of anything like the rush at the present time. Everyone seems to want to buy a bicycle—people

who never wanted to buy before—and the best of it is that they have the cash with which to buy. There is very little trading in of old machines and time is asked for on but few purchases. One of the largest dealers said that in the few instances in which credit was asked at least half the purchase price was paid down.

## SPRING WEATHER STARTS TRADE

**Cleveland Stores Freed of Burden of Sold Machines  
—Better Grades in Demand.**

Cleveland, April 17.—As a result of the genuine spring weather which began last Monday morning, for the first time this year and extended through the week, the stock of "sold" bicycles accumulated in the local stores during the past month were all called for during the first two or three days, and every dealer in town reported a very satisfactory business throughout the entire week. As has always been the rule here, the early sales were of the better grades of machines.

Notwithstanding a report to the contrary made in a recent issue of a contemporary, the chainless is meeting with very good reception, but its success seems to depend very largely upon the inclination of the dealers handling it.

Three department stores, two of which have just entered the field, promise to make things interesting in both the bicycle and sundries trade. They are offering bicycles as cheap as \$18 with "first class equipment and fully guaranteed;" but the larger portion of their business promises to be in several comparatively well known makes which they are selling at considerably below the usual list prices.

In the sundries business the department stores are cutting into the dealers worse than ever before. Just at present two of the "big stores" are waging a small sundries war between themselves and doing it so vigorously that the legitimate dealers are making little effort to compete.

Traveling salesmen are alarmed at the suit brought by the attorney-general of Ohio against the railroad companies to do away with interchangeable mileage.

## PHILADELPHIA FRAUD EXPOSED

**A Retail Firm Found Selling Spalding Machines at a Very Low Price and Without Nameplates.**

Manufacturers, agents, and those who are interested in the decent conduct of the bicycle business, will be pleased to hear that A. G. Spalding & Bros. have secured an injunction restraining a Philadelphia concern from attempting to trade upon the name of Spalding. For years past the prominent makers in the trade have been annoyed by unscrupulous concerns throughout the country who have attempted to trade upon names established by a liberal expense of advertising and good business methods.

A. G. Spalding & Bros.' attention was attracted to an advertisement which appeared in the Philadelphia Record of April 8, as follows:

### The Advertisement.

Spalding bicycle, \$13.50; all new wheels. These wheels are manufactured by the Spalding company; made of Shelby seamless steel tubing, 3-inch drop, Spalding hangers, Spalding pedals, Spalding hubs, with felt dust-proof caps; Excelsior spokes, Fairbanks one-piece rims, internal expander head and seat post; strictly 1899 models; guaranteed for one year; choice of tires and saddle.

The price, \$13.50, is the result of a stroke of good fortune, which threw this famous wheel into our hands, at one-fourth the usual wholesale price. Don't waste your money on a cheap wheel when you can buy the Spalding for \$13.50.

All leading wheels at one-fourth regular prices. With 400 feet of floor space, filled with wheels, we can show you any make you name, and sell it to you at one-fourth the regular price. Reliable high-grade second-hand wheels, thoroughly overhauled, from \$5 up. Lamps, bells, saddles and sundries of every description at one-half regular prices. Tandem tires worth \$8 per pair, \$1.75; the great Samsons, \$1; American Pacemakers, \$1.50; American Flyers, \$2; New Yorks, \$1.50; Ormonds, \$1.50; Pathfinders, \$2; Amazons, \$1.50; Goodyears, \$1.50; Stars, \$2; Morgan & Wright, 3 styles, 99; Hartford, 3 styles, 70, 77, 80; Vim tires, \$2.50; Chase, \$2.50; 30-inch tires, \$2.25; pure Rubber tires, guaranteed new and to hold air, 49c. 311 Market street.

### A Detective Gets to Work.

Messrs. Spalding realized that such an unauthorized use of their name in a misleading advertisement would prove ruinous to their Philadelphia interests, and at once put the case in the hands of their attorneys, Jones & Carson, with instructions to proceed to a more thorough investigation and to take the matter to court, in order that their name and interests might be protected. The following is a report of the detective placed on the case:

Operative went to the store No. 311 Market street, when a man came up to him and asked him if he wanted to buy a wheel. He replied that he first wanted to know the cost of the outfit. The man then invited Operative to the center of the store, and showed him their \$13.50 wheel. Operative asked what make it was and the salesman replied, "Spalding." He then gave Operative the following figures: Spalding wheel, \$13.50; "Never-Out" lamp, \$2.70; tool bag, complete, \$1; good bell, 65 cents; express to Palmyra, 25 cents. Operative told

the salesman that he wanted the wheel for his brother, a minister at Palmyra, who had seen the advertisement in the Record, and wanted something for road use. The salesman suggested that the Operative get the Hartford tires. Operative again examined the wheel and the salesman struck the pedal with his finger, at the same time saying, "Spalding pedal and Spalding hub."

Operative then asked if they were the same people who had been up on Chestnut street, and the salesman replied, "Yes." Operative said that he knew their reputation, but thought that the "Spalding wheel" was much higher in price. The salesman then said that Gimbel was selling the same wheel for over double the money, but that they, meaning No. 311 Market street, were making a big rush, and as their expenses were small, they could do it.

#### No Nameplate on Machine.

Operative noticed that the wheel which he claimed was a "Spalding" had no nameplate on it. He then said, "Wait until I show you how we are selling them." He went to the rear of the store and returned with an order and sales book. He turned the pages, and the Operative saw that they spelled the name "Spalding" in lead pencil, and about half of the sales were for the Spalding wheel.

Operative states that they are doing a good business, and the Spalding wheel is the attraction. In fact the Spalding is the main topic of conversation. The salesman suggested that the Operative leave a \$5 deposit, but the Operative replied "No." The salesman then said, "You are going to look somewhere else, and in the end will come back and buy a Spalding." He stated that so many people did the same thing. Operative replied that perhaps he would do so.

He then gave Operative his card, which reads, "David G. Hirsh, No. 311 Market street, Philadelphia, American Flyer Bicycle Co."

Armed with the above report and those of other witnesses, J. W. Spalding went to Philadelphia on April 15, and his lawyers presented the evidence to a judge sitting in the Common Pleas Court, who thereupon issued an injunction against the American Flyer Bicycle Co., of 311 Market street, its officers and employees, restraining them from making, selling or advertising any bicycles under the representation that they are the same bicycles as made by A. G. Spalding & Bros. The security was fixed at \$1,000.

#### Trapping the Salesman.

Operative called again and said that he, like the others he had spoken of, "had come back."

The Operative stated that he had seen Wanamaker's \$25 wheels and could not see the difference, although the price was \$11.50 more, and believed that he would buy a Spalding, and take it with him to Palmyra. Mr. Hirsh replied that he was sorry, but he could not let the Operative have a wheel until evening; that they had them in the city, but some hitch kept them from getting them to the store. Operative said he would call in the morning. He asked the Operative to make a small deposit, and let him pick out a wheel for him (Operative), and for the latter to come in the morning and get it.

Mr. Hirsh and the Operative then went to the office, which is the rear of the building. He told the Operative if he would get Hartford tires it would be a wheel far ahead of the highest grades. In making out the bill he understood that the Operative wanted the tires taken off, and the Hartford tires put on, and made the amount, in the first place, \$18, but afterwards changed it to \$13.50. Operative gave him \$5 on account.

#### An Opening in Cuba.

Milwaukee, April 17.—Martin J. Riley, who made the journey to Cuba in the interests of the Julius Andrae & Sons Company to scan the field and examine into the possibilities of the country as a market for bicycles, has returned.

A fair number of bicycles are being placed on the market in Havana, Mr. Riley reports, and he predicts that the trade will be good in that vicinity if it is carefully worked up. Of course there are all the difficulties to be met that accompany wheeling in the tropics, but nevertheless a greater success than ordinarily is predicted because of the lazy nature of the inhabitants. When they begin to appreciate that it is easier to ride a bicycle than it is to walk it is expected that the whole population will be riding. There are a number of good roads in the vicinity of Havana, particularly in the sub-

urbs, and some of the country roads are hard and firm, excepting during the rainy season. In Havana proper the roads are just passable, being paved for the most part with cobblestone. It will be a long time before the women of Cuba take to the bicycle, because of the national prejudice against women taking a prominent part in any phase of life there.

### CANADIANS MAINTAIN SECRECY

#### Big Manufacturers Meet to Discuss Amalgamation But Say No Options Have Been Given.

Either the consolidation plans of the Canadian manufacturers are being conducted with great secrecy or there is some hitch in the scheme, for nothing authentic develops regarding the combination. The firms reported to be interested in the scheme assert that they have not as yet given any options on their plants and appear to be waiting for something. Senator Sanford and William Hendrie have been mentioned as backing the project, but will make no statement until the deal is further developed.

Mr. Evans of the Evans & Dodge factory, who attended the first preliminary meeting held in Toronto, April 11, for the purpose of discussing the proposed amalgamation, at which all the big Canadian companies were represented, made the noncommittal statement that the affair may go through in a few days or may not be brought about at all. Refuting the report that the E. & D. plant would be removed from Windsor he said, "The industry will not be removed from Windsor whether the proposed amalgamation of the Canadian wheel manufactories is a go or not. On the contrary, if the companies are amalgamated the mechanical staff will be increased from 150 to 300. The same addition will also be made in other factories that figure in the deal, because there will be a great increase in the number of cheap machines turned out. There are now about 30,000 low grade bicycles manufactured in the dominion, and about 40,000 imported from United States. The Canadian companies expect, under their amalgamated power, to make a bicycle to compete with the imported American cheap bicycle, and ultimately keep it out of Canada."

### THINKING OF ORGANIZING

#### Repairmen of Washington City Wish to Reap Benefits of Uniform Prices—Existing Charges.

Washington, April 17.—There is some talk among the prominent repairmen of this city of organizing an association to maintain a uniform schedule of repair prices and to correct certain abuses which now exist in the local repair business. That there is urgent need for such an organization is apparent to all the well-informed men in the business. Repair shops are as thick as bees in a hive, and in many cases they are operated by inexperienced workmen, the work they turn out being naturally far from satisfactory. Such a condition of affairs has a tendency to bring discredit to the entire trade, but with a permanent organization the abuses could be remedied and all the evils that now exist could be successfully attacked. It has been amply demonstrated that unanimity of action is desirable among repairmen and it may be that local repairmen will get together at no late date and effect an organization, which should be of such a nature as to keep out poor and unsubstantial work.

The following are the reigning prices among the better class of local repairmen:

Cleaning wheel all over, including bearings ...	\$1.00
New chain guard .....	.75
Putting link in chain .....	.25
Lacing chain guard .....	.25

Lacing mud guard .....	.40
New crank axle .....	2.00 up
Cementing grips, per pair, including grips .....	.25
Enameling rims, per pair .....	1.00
Cones made, each .....	.75 up
Truing wheel .....	.25 to .75
New axle, front or rear .....	.25 to .50
One new spoke .....	.25
Two new spokes .....	.40
Each additional spoke .....	.10
New rim put on .....	1.75 to 3.00
New thread and nut on axle .....	.25
Rear sprocket .....	1.50
Cutting down frames, including enameling .....	5.00
Truing frame .....	.75
New fork .....	4.50
New fork sides, single crown .....	1.25
New fork sides, double crown .....	1.50
New fork tips, each .....	1.00
Truing forks .....	.50
Enameling machine complete .....	3.50 to 6.00
Striping frame .....	1.00
Vulcanizing valve stem and recementing .....	.75
Vulcanizing puncture and recementing .....	.75
Patching inner tube .....	.35
Putting in inner tube .....	1.50
Metal valve, put in .....	.50
Valve only .....	.25
Valve stem .....	.25
Valve and stem .....	.50
Valve cap .....	.05
Cementing tires to wheel, each .....	.25
Plugging, each hole, separate tires .....	.25
Chain guard, put on .....	1.25
Mud guard, put on .....	1.50
Splicing seat post, not nicked .....	.50
Splicing handle bars, not nicked .....	.50
Replacing top tube, including enameling .....	2.50 to 3.50
Replacing lower tube, including enameling .....	2.50 to 3.50
Replacing seat post tube, including enameling .....	2.50 to 3.50
New head lug, including enameling .....	2.00
New rear stays, including enameling .....	3.75
Seat post cluster, including enameling .....	2.50
Hanger bracket, including enameling .....	2.50 to 5.00
Rear fork ends, including enameling, each .....	1.25

### Exports of Cycles and Materials.

Exports of bicycles and materials from the port of New York for the week ending April 11 are recorded as follows:

	Bi-cycles.	Materials.
France .....	\$25,113	\$ 5,857
Germany .....	15,233	9,721
Sweden .....	14,055	1,078
England .....	8,508	5,721
Denmark .....	9,325	1,354
Russia .....	9,184	482
British East Indies .....	6,032	564
Africa .....	5,926	283
Italy .....	1,040	1,763
British West Indies .....	1,857	522
Belgium .....	475	1,504
British Guiana .....	961	316
Scotland .....	327	....
Argentine Republic .....	320	....
Roumania .....	748	....
Egypt .....	635	....
Holland .....	....	632
Prussia .....	....	444
U. S. of Colombia .....	40	130
Danish West Indies .....	123	17
Norway .....	100	....
French West Indies .....	50	....
Austria .....	50	....
Hong Kong .....	50	....
Bavaria .....	....	50
Venezuela .....	50	....
Ecuador .....	....	40
Cuba .....	21	12
French Guiana .....	23	....
Totals .....	\$121,246	\$30,540

### New York Repairers Rushed.

Only in the transforming days, when pneumatic tires were substituted for cushion tires, were the retail dealers of New York city as busy as they are at the present time with repair work. One Harlem dealer took in nearly twenty jobs one evening last week. Other dealers report extensive work in rebuilding old machines, besides re-enameling and re-nickeling. As this class of work brings in from \$2 or \$3 up to \$20, it is a fruitful source of income.

The Leipzig postal authorities have provided a number of cycles for their telegraph messengers. They also employ tricycles to carry the letters from the street collections to the central offices.

## BRAZING BY IMMERSION

### Enameling Over Brass Coating Left After Dipping—Common Faults in Newly Installed Furnaces

Frame Connections Must be Open

Regarding the various reasons why some experimenters with immersion brazing have trouble in getting the brass to flow from the tubing after dipping, it clogging in the joints instead, an expert with several years' practical experience in such brazing says:

"I recall one instance where a firm dipped twenty-five frames, and in order to get the spelter out of the tubing was compelled to cut every frame to pieces. The reasons for this clogging of the brass are several. In some cases the frames have not been properly prepared. Before a frame is dipped it is necessary to have as large a hole as possible through each of the connections in order that the spelter may flow in and out of the tubes quickly. Some are of the opinion that a one-quarter-inch hole is large enough to allow the spelter that will get in through a one-eighth-inch hole to flow out readily, but such persons need but to dip one frame to find that the smallest hole through which the spelter will run out satisfactorily is five-eighth-inch.

"In some cases when a crank hanger is dipped, the spelter that flows into the lower rear forks will force itself two or three inches above the line to which the joint is dipped. The reason for this is that the rear end fitting is air tight and no small hole has been drilled near the rear extremity of the fork tube to allow the air to pass out, and as the air forces itself out the other way it also forces the brass up into the tube, where it there solidifies at once.

"Another reason for clogging of spelter is that the brass in the crucible has not been brought to the proper heat at the time dipping operations are commenced. Some imagine that as soon as the spelter has reached a point where it will pour if lifted in a ladle it is all right for brazing. This is not true. The brass must be some degrees hotter before it will run freely into and out of frame connections. The kind and amount of flux used in the crucible also has to do with this question, but the experience of different brazers is so at variance that it is pretty hard to state definitely just what is the best method of procedure in this line."

Enameling Over Spelter Coating

A Cleveland manufacturing concern has settled the spelter removal question, to its own satisfaction at least, by leaving the bulk of the brass coating on the frames and enameling over it. After the frames have been brazed they are sent to the filers, whose sole duty it is to remove the largest lumps of spelter around the joints. The frames are then handled by polishers working on grooved polishing wheels coated with emery. Wheels of different sizes and with different curvature of groove, to conform to different joints and different sizes of tubes, allow all but the close corner portions of the brass covered surfaces to be reached. These polishers do not remove the brass from the tubes and lugs, but merely smooth it down so that there are no abrupt changes from high to low spots and no distinct line showing where the brass coated area merges into the clean tube surface. Corners not reached by the wheels are smoothed down by hand with emery cloth.

After the frames have been finished in this manner they are placed in large ovens similar to enameling ovens and baked there at a temperature of about 400 degrees Fahrenheit. This baking operation leaves the brass without its usual characteristic greasy surface, which has formerly been the foundation of the chief objection to enameling upon it. After the baking, the brass coating is said to take the enamel as well as the steel tube. The company employing the process has experienced no trouble on account of the enamel peeling or blistering from the brass coated parts. The brass, in fact, after the removal of the greasy substances furnishes a ground for enameling which cannot possibly rust, as do steel tubes quite frequently

long after the frames have been enameled and the bicycles sold and used.

The great reduction in the filing expenses brought about by the process referred to and the small cost of smoothing up the brass on the polishing wheels have led the firm to believe that it had better leave well enough alone, and so it is satisfied to continue with the process rather than to experiment with anti-flux preparations and cheap methods of removing spelter.

Many Kinds of Flux in Use

Flux plays an important part in immersion brazing, but no definite ideas on its use seem to have been reached by brazers. In some shops the flux covering the surface of the spelter in the crucible is maintained at a depth of from two to three inches, while in other factories the layer is as thin as one-quarter of an inch. Flux layers of all depths between these limits may be found.

Not only is there a wide divergence of opinion as to the amount of spelter to be used, but the kind of spelter used is different in almost every shop. In one factory now employing immersion brazing successfully a flux composed of three parts borax and one part boracic acid is considered the proper compound. Another factory, however, turns these proportions right around and uses a compound of three parts boracic acid and one part borax. In other places there are furnace operators using straight borax. Boracic acid is also used without mixture with borax or other chemicals, and some brazers have been successful in applying a compound consisting of sixteen parts of boracic acid and one part of common soda. This last compound is made by placing the two ingredients together in a pan and baking in an enameling oven, or similar heating place, till the two melt and unite. After solidifi-

cation the resulting compound is broken up and is ready for use. The compound is of the nature of borax, but contains but one-fourth as much sodium in relation to the boron present as does straight commercial borax.

A large western factory in which immersion brazing has been practiced for two years has found that the cleaning out of the joints is much aided by dipping the frame joints in a liquid flux preparation previous to brazing. While satisfactory results have been obtained by leaving the entire work of cleaning off the metal parts to the flux in the crucible, the painting or dipping of the joints previously makes assurance doubly sure, and as but little expense is added, if the work be carried on systematically, the practice will doubtless be more or less adopted by other manufacturers.

Numerous Causes of Failure

In the line of causes of failure to make dip brazing furnaces operate successfully, the experiences of many factories show that there are any number of small points to be observed, any one of which if neglected will sometimes place the process in an unfavorable light. A plant installed in an Indiana factory gave unlimited bother because it smoked constantly and filled the room in which it was located with disagreeable fumes. The furnace came near being abandoned when it was discovered that the only fault was that there was not sufficient draft. This error being corrected, the furnace ceased smoking and has been in constant use ever since. In fact, so successful has it been that every joint brazed in the factory with the exception of the union between the front fork stem and crown is dipped, and the superintendent of the factory has estimated that since the introduction of the furnace and supplementary practices made possible by its use he has reduced the cost of brazing and finishing frames ready for the enameler about thirty cents each.

The furnace installed in a Cleveland factory had while in operation several small ills, any one of which was easy of remedy, but all of which together made the furnace nearly a total failure. The bricks which formed the cover to the flame and heat passages from the firebox did not extend to the ends of the crucible, but merely covered the passages for a short distance to each side of the center of the crucible, leaving at the ends open passages for the heat to rush upward toward the hood without effecting in any way the spelter in the crucible. The distance between the sides of the crucible and the walls of the furnace and the distance between the top of the crucible and the lower face of the cover were very irregular and in most places greater than they should have been. The forcing of the heat over and across the crucible was, hence, very irregular and ineffective, and much more fuel than

necessary was burned in the endeavor to maintain the spelter at brazing temperature. The draft entered the furnace through two distinct pipes each of which had an independent regulating valve. At no time was the operator able to regulate these two drafts so that the air blown into the two ends of the furnace would be equal in volume and pressure, and consequently either one end or the other would be much the hotter.

# Crescent Bicycles

At the Crest of Favor.

ALL THE EXCELLENCES OF A PERFECT BICYCLE ARE UNITED IN THE CRESCENT.

Adults' Chain  
Models, \$35

Bevel-Gear  
Chainless Mod-  
els, \$60

We should like to send you our  
Illustrated Catalogue, No. 2,  
containing "THE CARE OF  
THE WHEEL," Free.

Crescent Quality

... AND ...

Crescent Prices.

The essential thing in bicycle-making is quality. Bright nickel and smooth enamel may sell one wheel, once; but it is the quality under the nickel and enamel that gives a wheel a good name wherever it is ridden, that makes this year's sales better than last. And that has been the story of Crescent Quality from the start.

The only thing about a Crescent that is not "sky-high" is the price. It is just high enough to give you your money's worth and us our product's worth. It is a moderate price and a firm price. You never hear a Crescent rider complain of Crescent prices. You never hear us apologize for them.

PROOF AGAINST TACKS AND CACTUS.  
Phillips Bros., Bicycles, Sundries and Supplies.

WACO, TEXAS, April 15, 1899.  
MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee Wis.  
Gentlemen: We are in receipt of your favor asking what success we are having with your tires. As far as we have seen them used we cannot say too much in their behalf, and think we can truly say they fill a long felt want. We have never had one punctured nor expect to meet with any such accident. A rider who we sold the first pair to was in the other day and said, "take your old tires; I have a tack in my rear wheel." We immediately examined the tack and removed same from the tire, which proved to have penetrated only through the rubber and then turned back as if struck with a hammer, simply clinched. No other tire that we have ever sold would have stood this test. The only reason that we can see for not handling and trying to sell to all of our riders is, as our puncture-boy says, "I am afraid I will lose my job if this keeps up." Wishing you success and assuring you of our support, we remain,  
Very truly,  
(Signed) PHILLIPS BROS.

MILWAUKEE, Wis., December 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.

Gentlemen: As an expert on parts and high-grade bicycle construction, I have given your puncture-proof tire a thorough and severe test, and in all such tests have found it as claimed—a puncture-proof tire.

I have used quite a large number of them during the past season and never had the least complaint. Your tire is heartily recommended.

Faithfully Yours,

(Signed) A. G. HENRICKS, Montgomery Building.

## DEMAND FOR CHEAP MACHINES

A great many people whose views upon trade affairs are usually regarded as sterling have pronounced favorably upon the outlook for the sale of high priced bicycles, and so persistent have they been in proclaiming this belief that the trade at large has unconsciously fallen into the mistake of imagining that serviceable machines at lower prices are not meeting with any marked degree of favor. The unprecedented heavy sales of high grade stock by agents in parts of the country where weather conditions have encouraged buyers does not imply that the humbler goods have been eclipsed, for it is admitted by these same agents that the public demand is much larger than it was this time a year ago and the increased patronage has been extended to cover all grades of machines.

Everything conspires this year to give unwonted advantage to makers and sellers of high priced machines; values are lower than formerly, public appreciation of grade—as it may be indicated by price—is rising to its zenith, and there is such a leveling of values that people do not shrink from the largest investment as they did of old. But in the face of all this the lower priced product is more than holding its own, and for two very plain reasons: (1) There are countless poor people who wish to ride bicycles; (2) there are more, and more active, forces at work in the manufacture of low priced goods than are opposed in the manufacture of high priced machines. Moreover, every form of selling agency, dealer, jobber and department store, has of late years spent the greater part of its energy in pushing the cheaper grades.

Cheap machines—not inferior ones—are scarce today. They are easily sold at retail; they are hard to procure at wholesale. An eastern trader spent a few hundred dollars to ascertain these truths. Two weeks ago he advertised his willingness to purchase good machines at moderate prices. He got but two replies—one an offer to sell, and the other, from another buyer, begging the privilege of buying all he did not care to purchase of his offerings! Not deeming this conclusive evidence of the state of the market, he advertised again, but this time without result of any kind. Then, to test his conviction that low priced machines were practically out of the market, he advertised to sell good machines at low figures, and when last heard from was still cutting open replies.

## ACCOUNTANTS AT CYCLE FACTORIES

Aside from the possibility—or probability—that success will attend the present movement to consolidate cycle makers, it is the opinion, commonly shared, that the presence of a small army of expert appraisers and accountants among the factories is a matter of no misfortune either to the individual concern or to the trade at large. In the first place, the mission of these gentlemen is neither to alter nor destroy anything, but simply to determine values and conditions and report faithfully and impartially thereupon to those interests which have sent them forth; and the fact that this or that factory is visited by them with those strict purposes in view is a silent but valuable compliment to the favorable opinion entertained of its good name, commercial standing and capacity for earning dividends, by cold-featured investors.

That the results of the examinations now finished or under way will ever bother the public eye or ear, whether or not the combination takes form, is among the remotest of possibilities;

the men engaged in that undertaking can be trusted—they are no novices in such work.

Very possibly the individual manufacturer may learn something of value in the process. The nearest correct valuation of plant, equipment and stock of a cycle making concern can be made quite as well, if not better, by men having no special knowledge of the business, but yet equipped with abundant experience in similar work in general manufacture, than by any committee possible to be selected from among the makers themselves. Their appraisals do not take trade conditions or other side issues into consideration; they strike for current values only, though interpretation of the results presented by them must be made by the financiers in the light of the history of the industry.

Many see as a result of this general accounting a judicious leavening of the industry's spirit. Concerns which have passed through a similar experience, wherein a display of strength or courage—in the vernacular, a "show-down"—has been called for and given, usually exhibit a gratifying increase in their mutual respect, and cordiality of thought one for another is almost invariably enhanced.

In the future business enterprise will prosper best in the clearest light; the day of prosperity for covered means and methods has been permanently eclipsed. Industry is now passing through a period of evolution, without precedent, which will ultimately teach to all men the value of light. The larger day of the expert accountant is but dawning. It may come to pass in the early days of the approaching century that his certificate, supported by invited examination, will be a more common basis of credit than the conjectured ratings of the commercial directories.

## PERMANENCE OF EXPORT TRADE

Probably the most important problem in relation to the export business in manufactured products is the extent to which domestic products should be adapted to the existing tastes and demands of an importing nation. Irresponsible critics do not hesitate to condemn manufacturers for what they choose to consider conservatism when the volume of foreign trade appears to be less than it would be where the outline or non-essential characteristics of the product varied. This attitude, however, is consequent upon a superficial study of the question.

Without going into the broad questions of economics in their national aspect, but dealing with the question from a purely individualistic standpoint, it is evident that the object a manufacturer has in creating an export demand is to increase the gross volume of business, that his profits may be either increased or placed upon a more equal basis. It must be apparent to anyone who investigates the subject that other issues than actual turnover are essential to the increase of net profits. It is of small value to the manufacturer if in increasing his turnover by \$50,000 the cost of creating the business exceeds that figure.

As usual with questions relating to modern commerce, the commercial aspect of the subject is closely related to practice followed in the factory. The excessive competition among the manufacturers of this country has resulted in a condition in which the profit that is added to the factory cost is restricted to the lowest possible margin. It is a generally recognized fact that the additional profit that is added beyond first cost and ultimate charges is so small that it has almost to be ignored. The manufacturer having to look for the maintenance of his income for economies effected in the internal operation of his plant and production of output, apart from improvement in system and the specialization of departments, the principal factor in effecting these economies is an increase of output. It is apparent, however, that this increase must take place along the general line of manufacture and not take an exceptional character which would necessitate the establishment of a distinct department and system in order to produce at prices which would compete with the foreigners' own product.

The net result of the investigation indicates that if export trade is to be of permanent value to the country it must be of American goods built in the American way and the American style. The magnitude of the business must depend entirely on the aggressiveness and tact of the salesman and consistency of commercial relations.

## STORE WINDOW DRESSING

### Dealers Should Scheme to Make Show Windows Attractive from an Advertising Viewpoint

If you are a retail bicycle dealer you must have some kind of a display window or you would not be keeping a store. The man who built the store put in the window to be used for displaying samples, not merely to admit light or make the place look like a store. You are handling bicycles to sell and make a profit on—then why not make the best possible use of the space you are renting, by utilizing the show window to the maximum advantage?

In the first place, keep it clean. Glass is put into windows because it is transparent, and you would kick very hard if your show window was of inferior glass. Then, by all means, keep the dust from the inside and the storm spatters from the outside.

#### Display Should Invite Inspection.

You no doubt place bicycles and sundries in your show windows, but how do you arrange them? You may have some of the best machines in the market standing in your window, yet passers-by scarcely give them a glance. Why? To begin with, your window is dirty, and that is sign of carelessness and indifference that may be inferred to extend to your business methods. Then, what have you covered your window platform with? Or have you left the boards bare? You have covered it with oil-cloth? Well, that is almost as bad. Oil-cloth is all right for a kitchen, but if you are conducting your business with a view to attracting custom your store should present the finest appearance possible, and the window ought to be the first thing to arrest attention and invite the public inside.

Perhaps you have scattered your sundries in that window in such profusion that you have made utter confusion; there is no order about their display, and they attract very little notice. No doubt there are many other faults about your show window that you can pick out if you will stop to think awhile.

#### Make War on Your Window.

Now, a revolution means a total or radical change—you want to start a little revolution of your own in that show window. Outside appearances are indicative to the public of the unseen things within. Make your window display of such a character that people will stop to look at it and talk about it. The man who stops to look to-day is the man who buys tomorrow, and it is by attracting his attention on one occasion that you secure his custom on another.

You may be of a mechanical turn of mind only, your artistic ideas having been undeveloped, but the man who can see beauty and symmetry in the lines and form of a piece of metal work does not have to struggle long to originate a few practical ideas about decorations that concern the displaying of that work. There are ways innumerable, notwithstanding you may think it difficult to formulate a plan, and no one can state a limit to the variety of effects to be attained. What if some of the decorations are a trifle expensive—was any commercial business ever conducted without some expenditure? The show window is one of your best advertising mediums. Suppose you try its effect on your public, and see if it does not warrant the expenditure.

Decorative bunting, also known as

cheese cloth, can be obtained at any dry goods store in a large variety of colors and several qualities. The best width for your purposes is 36 inches. It will cost you from 5 cents to 12½ cents a yard, and of course the better the quality the better the appearance. Purchase enough of this material to inclose your window, unless it is necessary for all of the light to pass into the store. If your room is not too high it is well to run the bunting to the ceiling, although a fine effect can be made by extending it only part way up. It may be necessary to build a framework on which to tack the bunting. Strips of pine or whitewood one inch square will answer the purpose to perfection. Tack the bunting in folds or plaits of neat width, up and down the sides and back of the window, using common pins for the purpose. If your window is of good size and you wish to display more than one machine, make separate compartments—a horseman would say stalls—for each, using the bunting for the partitions. In the bottom strew the bunting in puffs, and on this place your bicycles in such positions as will be most attractive from the outside.

#### Use of Harmonious Contrasts.

If you wish to admit plenty of light to the store, make your decoration reach five or six feet above the bottom of the window, and on the top of the framework make a succession of pretty puffs by gathering a continuous strip of bunting in small bunches and fastening every few inches; narrow strips will serve best for this. This style of ornamentation may be carried out wherever it may add to the general appearance. The color to be used must depend on individual taste and harmonious relation to woodwork and machines. If you are going to show a black enameled bicycle white bunting will make a beautiful contrast. It will answer also for yellow and blue enamels. Use pink bunting for green enamel, and green bunting for red enamel, and so on, endeavoring to make a pleasing contrast.

Put some sundries in the bottom of the window if you like, but do not endeavor to show every article you have at once. You may have half a dozen styles of lamps, but it is not necessary to display them all the first time. So with the other sundries, which you can change often.

Now, this window dressing is not intended to suffice for all summer, and should not be allowed to become covered with dust and dead flies. Try to think out another effect yourself. Scheme to make your show window—your leading card—stand ace high. You can do it.

#### Developing Ability in Employees.

Some employers never seem able to understand the first principles of handling employees. They never allow themselves to think that the store could get along even for a day without their presence. They burden themselves with all the minor details of the various departments and thus in large measure relieve the heads of departments and subordinates of all responsibility. Such wholesale distrust on the part of employers is reprehensible in the extreme. They do themselves infinite harm while at the same time they injure their business and weaken the capabilities of their employees. There is but one

way to develop ability, and that is to place responsibility upon the shoulders of those with whom you desire to intrust the execution of important instructions. Retail merchants are not the only business men who make mistakes in the management of employes, for even manufacturers frequently err grievously in this most important particular. They go on year after year laboring under the delusion that they themselves only understand the business in which they are engaged; and apparently it never occurs to them that they could entrust at least the routine work with others. In consequence the ability of employes lies dormant and the employer finds his work grows more burdensome with passing years.

#### Cleaning Show Cases and Windows.

There is nothing more untidy in a bicycle store than dirty, greasy showcases—excepting, of course, show windows impervious to light and vision.

Showcases may be kept shining and bright with very little work. A good cleaning powder for showcases, and also for windows and mirrors, is prepared by moistening calcined magnesia with pure benzine, so that a mass is formed sufficiently moist to let a drop form when pressed. The mixture must be preserved in glass bottles with ground stoppers in order to retain the easily volatile benzine. A little of the mixture is placed on a wad of cotton and applied to the glass. Do not use near a fire or light, as the benzine vapor is very inflammable and explosive.

#### Garcia's Stirrup Pedal.

The illustration shows all the details in the construction of a stirrup pedal recently patented by Raphael B. Garcia of New York city. One half of the pat-

ent is assigned to C. F. Kabisch of the same city. The fastening of the stirrup portion to the pedal sleeve seems to be the weakest feature in the device.

#### Lax Laws in San Francisco.

The cycle ordinances of San Francisco are in a rather chaotic state. There is a bell law, but it was not enforced for months. The Hibernian city authorities, however, celebrated St. Patrick's day by arresting all wheelmen without bells, who were subsequently bailed out, admonished and discharged. Lamps are not obligatory except in Golden Gate park. There is one cycle path, not too wide, extending to the ocean, and although this is necessarily used both ways, there is no speed restriction whatever. Indeed, it would take a jaded wheelman to resist the invitation to scorch offered by the signs "Quarter Mile," "Half Mile," "Three-Quarter Mile" and "Finish" erected along a fairly level but dangerously curved part of the path.

The winter just past has been one long period of the most perfect cycling weather, perpetual sunshine, with a lovely, bracing atmosphere and the best roads ever known in California.

## LIGHT FRAME CONSTRUCTION

### Flush Joints Secured Without Using Lugs or Thimbles— Rigid Front Forks of Tubular Design

To the Editor—The drawings herewith show the main features of a design I have had in mind for some time for light, rigid track machines in which weight should be reduced without sacrificing strength and without making some parts abnormally light in comparison with other parts left quite heavy. The purpose of the construction and design is to accomplish the oft-attempted engineering aim to proportion the weight throughout the machine according to the work and abuse imposed upon each part. I do not attempt to give exact measures and plans for making the various parts of the bicycle, but merely describe the general scheme in such a manner that anyone may work it out. It might also be stated that no claim is made for marked originality, or for radical or sweeping improvements; the design is merely offered as a conservative and commercially safe method of producing distinctive appearing, light and thoroughly reliable bicycles which will meet popular requirements.

#### Connecting Lugs Centralize Vibration.

For several years frame builders have been wavering between various forms of joints, and many attempts have been made to produce frame connections which should at once be distinctly novel and possess the strength required of them. But in all of these attempts some form of connecting lug has been used. Even in the butt end flush joints, which were introduced and dropped almost in the same moment, a thimble or similar distinct and separate piece was used in forming the connection.

Though used in many forms and called by many names the connecting lug is still universal, and while no widespread prejudice has been created against it, it will be found upon reflection to possess two obviously important objections which work against it in consistent light weight construction. In the first place, its bulk causes the vibrations of the frame members to centralize at the points where the tube joins the lug. Hence the many attempts at reinforcement by liners, taper gauge tubing, etc. In the second place, the weight of the lug formed joint is not consistent with the other parts of the frame in consideration of the fact that the factor of safety of the tubing need not be exceeded in the joint.

#### Lap Brazed Joints the Simplest.

Improved facilities for pressing and stamping metal now make it feasible within certain limits to form tubing and tube ends into any desired shape. For that reason I see nothing to hinder the use of lap brazed frame joints and to thus dispense with frame connecting lugs—forged, cast, stamped. The lap brazed joint is the simplest joint of all. It has been made and used with success and some of those old frames of '94, in which all of the joints were lap brazed, were in construction, if not in design, products a maker might be proud of today. Lap brazing need not be as expensive now as then, and can doubtless be accomplished with much more accurate and reliable results. The bicycle design herewith is accordingly offered as a suggestion in the way of constructing a light bicycle frame without the use of connecting lugs and in a fashion commercially practical.

The frame construction is shown in Fig. 1. The upper and lower front frame rails

are of taper gauge tubing. The forward end of each is flashed to inclose the steering head tube which is roll swaged down at each end to a degree corresponding with the thickness of the flashed tubes. The front tubes of the frame thus surround the steering head in a manner which after the frame has been brazed and filled affords a flush joint.

The reason for using taper gauge tubing is that in flashing the tubes enough wall thickness shall be left at each flash to afford sufficient strength. Were the tubes flashed in dies in such a manner that there were no tendency to thinning out of the metal during the operation, the grad-

projection enough to give it the strength of a seat post and allows the saddle to be clamped to its upper end with perfect security.

In these days when frames are built in at least three heights, saddle adjusting, especially in racing machines, for which this construction, as previously mentioned, is recommended, is of no such importance as formerly. Supposing that frames built in this manner were furnished in heights of 20, 22 and 24 inches, and that in each frame the purchaser were offered a choice between seat masts projecting respectively one and two inches, then six saddle reaches might be had ranging in difference from one to the next above or below but one inch. Almost any desired reach could then be accommodated with stock machines.

#### Hanger Joints Can Also Be Lapped. |

The crank hanger joint in the illustration is shown as formed with outside lugs and swaged tube ends, giving a flush joint effect. This is done with two purposes in view. First, that a graphic comparison with regard to bulk of metal

Fig. 1—Method of Forming Joints and Plan of Frame.

ual thickening of the tube walls near the ends might not be necessary. The seat mast tube is cut a few inches longer than ordinarily and swaged down as was the head tube, the decreased diameter extending clear to the upper projecting end of the mast. A piece of tubing is slipped over the upper extension of the seat mast, and reaching down to the lap formed by the flashed rear end of the upper frame rail surrounding the seat mast, forms a flush union between the upper reach and the mast.

The supplementary tube also has another object. It reinforces the seat mast

in joints may be afforded between the flashed joints and one of the best known forms of flush joint connections where lugs are used; second, that the feasibility of using lap brazing at the upper joints, where it is more readily accomplished in connection with lug joining at the hanger, may be made clear. It must be understood, however, that lap joining at the hanger can be accomplished without any practical difficulty if the tube ends are properly formed in presses.

The seat mast can be lapped around the rear half of the bracket and the lower frame reach tube around the front half,

the two meeting each other at the bottom of the bracket. Each rear fork is lapped entirely around the bracket. By making the flashed ends of correct shape the entire system of lapping when completed, brazed and filled will yield a smooth flush hanger and branches. The bracket, suppositiously being the rigid base of a frame, it might be well in forming lapped

Fig. 2—Construction of Front Fork.

unions to it to use taper gauge tubing that the rigidity of the base might not be suddenly diverged into less rigid frame members.

**Straight Rear Forks and Stays.**

The design illustrated brings back one other feature of the old days besides lap brazing. It includes straight, round section rear forks and stays. This is, of course, not imperative in carrying out the main scheme of the frame, but adds to the rigidity and carries out the original intention of placing metal where it belongs and of using straight lines as the surest means toward the end of attaining symmetrical light weight construction.

The plan view in Fig. 1 is a reproduction from a scale drawing showing that straight rear forks can be used in connection with modern frame lines and without widening the tread or increasing the chain line. The tread is here four and one-half inches and the chain line is one and one-half inches, the standard chain line of track machines. No specified form of hanger is considered as almost any of the popular patterns in which the sprocket and right crank are closely hung can be employed. The connection of the rear stays with the seat mast completes the frame structure, the form of rear fork ends being left optional, there being so many varying ideas concerning this

Fig. 3—Handle Bar Fastening.

point. At its upper end each stay is bent on a short curve that there may be a short horizontal arm substantially at right angles to the stay. One of these horizontal projections is swaged down to enter snugly the open end of the other. A horizontal hole lateral in its relation to the frame is drilled through the seat mast

at a point that would occupy the center of the cluster were one present, and into this hole from each end are slipped the ends of the rear stays, one of these entering the other as described and as shown in the detail view in Fig. 1. When brazed in place the union is not only strong and rigid, but presents an appearance clean cut and suggestive of light weight design and construction.

**Front Fork Sides and Stem Continuous.**

The front fork is also of tubular construction, in keeping in principle with the construction of the frame. Each fork side or blade comprises a piece of tubing of oval section along its lower half and of half-round D section along its upper portion. The convergence from the D to the oval section is sharp and combines a convergence from small diameter to large. This does not necessarily mean a large difference in original diameters before the round tube was flattened into oval and D sections, but a difference between the finished diameters.

At the points where the D section begins to merge into the oval each tube is bent away from the flat side of the D at almost a right angle bend and is then carried down and out in a graceful curve which forms one-half of an arch which is formed by placing the two blades together with the faces of the D portions against each other, these then forming substantially a round section tube in two parts and reinforced with a double liner. By slipping over the two part upper tube so formed a round tube flashed at its lower end, much after the fashion of the one-piece stem and crown now used with continuous forks, a crown cone seat is fur-

their lowest position in the fork stem, and all riders aim to get bars of such curvature that the position of the grips will be right when the bar is at its lowest point of attachment.

In Fig. 3 is suggested a handle bar fastening for use with this fork. It might also be adopted successfully in connection with regular construction. A hollow cap is brazed to the upper end of the stem and has walls about one-quarter-inch thick. Through this cap is drilled a hole in longitudinal relation to the bicycle. The hole through the front wall is formed tapering and provided with serrations which match serrations on the tapering surface of a thick walled tube about five-eighths or eleven-sixteenths of an inch in diameter and which extends forward for an inch or more, according to the taste of the designer, and passes through a hole drilled in the handle bar tube, to which it is brazed and a connection without lugs or flashings easily and securely formed. The rear end of this tube or arm is of reduced diameter and is tapped to furnish screw threads back for a short distance from the end. The outside diameter of the reduced end is such that it will fit snugly into the hole in the rear wall of the fork stem cap, which latter hole is counter-bored at its outer end to form a seat for the round head of a screw engaging the interiorly threaded end of the arm or horizontal stem from the handle bar. The screw head is provided with one or more spanner holes or if desired is made hexagonal that a wrench may be used to operate it. It will be readily understood that by drawing up on the screw the handle bar stem will be drawn tightly into the serrated

Fig. 4—Appearance of Completed Bicycle.

nished which may be lapped around the under side of the arch and cover the union between the sides.

The fork and stem are thus complete, the stem and the blades being a unit in construction and the blades extending from the axle of the front wheel of the bicycle to the upper end of the steering head and there being also a liner throughout the entire length of the stem in exact line with the strains thrown upon the stem when obstacles are met in riding. The construction is clearly depicted in Fig. 2.

**Stemless Handle Bar Fastening.**

The foregoing construction obviously prevents the use of handle bars with a stem intended to slip down inside of the fork stem, but as few riders nowadays adjust the height of their bars by raising or lowering them bodily in the fork stem, any of the clamps now in use which attach exteriorly to the upper end of the stem may be used. Several well known makers are now using handle bars without stems and find such construction no drawback commercially. On racing machines the bars are never raised from

taper hole in the fork stem cap and thus secured in place. The same bar may be used either in an up-turned or in a down-turned position.

**Dip Brazing Desirable.**

From Fig. 4 the completed appearance of a bicycle so built and designed can be gathered. The frame lines are after the popular conception. One-inch tubing is used in the main tubes, the machine as it stands being intended as one for track use. The rear stays and forks are three-quarter-inch in diameter. Frames and forks built after the plan suggested are well adapted to be brazed by the immersion process which would insure a sure union of the double front fork stem parts and of the inserted stays at their union with the seat mast.

L. G. A.

**Hand Wheel for Handlebar.**

The old idea of employing a hand wheel instead of a handlebar for steering bicycles has been revived in a patent secured by W. C. Brandenburg of Sykesville, Md., with the modification that he makes the handwheel elliptic in shape,

so that the rider may have a wide or a narrow spread of hands accordingly as he turns the wheel stem in the fork stem. The main advantage claimed for the device is that the hand-wheel in any of its adjustments provides a number of convenient gripping places giving the rider a chance to rest by changing his posture. The illustration shows the device.

### WRAPPINGS FOR BICYCLES

**An English Inventor Produces Simple Paper Tubes to Replace Present Antiquated Methods.**

Despite the rapid improvements made in the construction of bicycles and in many of the operations employed in their production, the method of packing and covering them for wholesale delivery is at present in much the same condition as it was ten years ago, says an English exchange. It is one of those details, apparently trivial, which get overlooked; it is beneath the consideration of most works managers, whose minds are occupied with seemingly more important improvements in the workshops, while the intellect of the packer has never soared so high as to contemplate the possibility of improving anything. Thus it is that the ancient method of swathing frames and wheels in yards and yards of intricate paper or fabric bandages is yet with us. The system teems with disadvantages and difficulties; the number of packers required, the space necessary for wrapping at the works and unwrapping at the agent's shop, the untidiness of both these operations, and the time occupied—at least fifteen minutes per machine, a matter which often delays an important consignment at the last moment—all these things, and others besides, are against the present method.

It is remarkable, therefore, that until now no rapidly attached mechanical protection for the tubes of cycle frames has been invented. A Birmingham man has, however, lately patented a system of protecting the frame by means of tubes of stiff paper or cardboard slotted longitudinally, so that they may be slipped over the frame tubes and held in position both by their natural contraction and by tapes or other suitable additions. For all ordinary purposes, the paper tubes, such as are used for containing unmounted photographs sent by post, form ample protection for the frame, but the inventor also provides for the lining of these tubes with a soft material, for additional protection and for attaching fabric to the ends of the tubes to wrap over the lugs.

The idea is strikingly simple and practical; it has been carefully patented, and, when better known, the wrapper, already past its experimental stage, may be expected to command a big sale. It is certainly quicker and quite as effective as the very primitive bandaging methods which it is intended to replace.

### HARDWARE MEN AS AGENTS

**Fifty Per Cent of the Hardware Trade Now Sell Bicycles—Why Some Fail**

A large wholesale concern in the northwest writes concerning the handling of bicycles by the retail hardware trade:

In our opinion more than 50 per cent. of the regular hardware merchants in the country and in the smaller towns are in the bicycle trade. We also believe that this number is increasing and that in the future the bicycle trade will be largely in the hands of hardware dealers. You will infer from this expression of opinion that our hardware merchants are largely finding the bicycle trade fairly satisfactory. In our opinion the bicycle trade at a future day is likely to hold about the same position with hardware merchants as does the tin shop.

The hardware merchant is more favorably situated for selling bicycles and taking care of bicycle customers than dealers in any other line of trade can be. In our judg-

ment it is a wise step for the hardware merchant who is in a section of the country in which bicycles can be used to advantage to take hold of the trade judiciously and secure the best line of bicycles for his trade that he possibly can, and then to work the business intelligently and see that he makes it profitable and satisfactory, both to himself and to his customers.

Some dealers make a success of it; others make a complete failure. Where a failure ensues we think it is due to the fact that they have not taken sufficient pains to post themselves in regard to the construction of bicycles and as a consequence are not able to talk them up satisfactorily. The matter of making this business profitable or not is one that lies largely in the hands of the individual himself and depends much upon the policy which he pursues. If he endeavors to market his goods strictly upon the basis of price, buying anything that is offered to him, we think it must inevitably result in failure. If, on the other hand, he makes it a point to handle standard goods manufactured by responsible parties and sells the goods upon the basis of quality, then it cannot fail to be a profitable business. There was a strong tendency last season, in our opinion, to experiment with trashy bicycles because they were cheap, and it is barely possible that those who handle nothing but the better grades may suffer slightly on that account. We look upon this injury, however, as being but a temporary one, as quality is bound to win out in the end.

### BICYCLES WITHOUT LUGS

**Step Toward Brazeless Joints—Internal Pressure Transmitted Through White Sand.**

Three German engineers, Messrs. Schilling, Schorz and Ulmer propose to make bicycles without any other lugs than those formed on the crank hanger. Their method is similar to the hydraulic or oil-pressure methods already in practical use in this country for producing hangers and lugs, but instead of oil or water they employ white sand and they

propose to treat the bicycle tubing in such manner as to make special connection lugs superfluous. To this end the tubing is placed between heavy metal die plates which surround the tube completely except where the lugs are to be formed. The tube has been previously filled with the white sand and heated. By means of pistons moving in the tubes great pressure is now brought to bear on the sand with the result that the walls of the tube bulge out where they are not supported by the die, as shown in Fig. 1. The pressure is now relieved and the swollen portion is punctured from without. Pressure is then put on again, after first limiting the flow of sand by closing the openings in the die, and the bulged-out portion thereby assumes the form of the adjacent parts of the die, as shown in Fig. 2.

The logical sequence of this system would seem to lead very close to the hydraulic methods of frame making which were espoused by Mr. Hooley in England before his bankruptcy. The inventors state that their treatment produces no deterioration, weakening or malformation of the tube metal, but for those who are acquainted with the difficulties in making lugs on crank-hangers long enough by hydraulic or any other form of pressure, it is evident that tubes of the gauge usually employed in bicycle frames will not afford all the material

required for making a strong lug. With taper-gauged or butt-ended tubing better results might be obtained.

The information so far received points to an unfinished experiment, for which the inventors have hurriedly secured patent protection, rather than to a full-fledged workshop method.

### REPAIR PRICE SCHEDULES

**Evils Caused by Existing Irregularities Can be Overcome by Wide Adoption of Uniform Scale.**

(Reprinted from The Cycle Age.)

On another page there is presented a list of the repair prices in various towns.

In looking over the list it is at once apparent that great irregularities in prices prevail; that the same piece of work is estimated as being worth very much more in one town than in another. In several instances some towns in which greatly varying prices are charged, are so close together on the map that it must happen frequently that cyclists from one of the towns visit the other town and have occasion to become acquainted with the variation in charges.

The moral effect of this condition is, of course, to prime the public thoroughly with the idea that all repair prices are arbitrary and extravagant, and thereby bring about a general suspiciousness and ultimately force prices all over to the lowest notch. When that point has been reached the ambition to do good work, on the part of the repairman, must gradually vanish and give way to a desire to do as little as is absolutely required for obtaining the depressed price which the customer grudgingly pays.

If a somewhat uniform scale of prices could be adhered to the downward tendency which has already gone too far, might perhaps be arrested and a higher standard of workmanship would eventually follow.

The experience with uniform price schedules has, however, not been altogether successful except in places far removed from the centers of the bicycle and parts-making industries, and before any attempt is made to reach a general and fair estimate of what each of the most common repair jobs is worth, the cause of previous failures should be looked into.

A repair price schedule should be flexible enough to suit existing conditions, and it should not be plainly inimical to the interests of the public who are expected to pay the charges.

Better results may be expected from a schedule which gives maximum prices for the information and protection of the public while leaving the repairman all the latitude which he may desire for showing special favors to customers by lower quotations when circumstances warrant them.

### Geneva Company Not Burned Out.

It has been currently reported through various channels that the Geneva Cycle Company of Geneva, O., had been burned out. The fact is that the fire occurred in the factory of the Geneva Wheel Company, which manufactures carriage and wagon wheels, and the bicycle company's plant was uninjured.

### First Mortgage Held Valid.

The case of the Central Trust company against the Worcester Cycle company as to foreclosure of the trust company's second mortgage on the plant at Middletown, Conn., has been decided in favor of the cycle firm, the court returning to the trustee the personal property at the factory so far as the encumbrance of the Central Trust company is concerned. The value of the real estate will be absorbed by the American Surety company, which

has claims to it by first mortgage for an issue of bonds. The personal property was the much more valuable part of the Central Trust's claim, being appraised at \$100,000. The mortgage was given for an issue of \$500,000 twenty-year 5 percent gold bonds issued in 1896, of which \$320,000 were placed on the market.

**Hinged Cane Netting for Dress Guards.**

Max Diehl of Hanover, Germany, has patented in United States an interesting innovation in dress guards. He uses two sector-like frames of wood or metal

THE CYCLE AGE

which are filled out with cane or cord netting. He prefers cane as it is uninfluenced by moisture, easy to clean and preserves a neat appearance longer than cord. These frames are hinged, as shown in the illustration, to the upper rear stays in two places. If the stays are of round cross-section the frames may be simply clasped to them. At convenient points along the upper edge the frames are clasped, snapped or shackled to the mud guard.

The attachment of a dress guard to a bicycle should be effected in such man-

ner, says the inventor, that the following conditions are fulfilled, viz.: First, the guard-frame must be easily removable from the bicycle-wheel; second, the sector-frames of the guard must be so arranged that they can partly revolve upon the machine-frame without being removed from the same. The first condition is an absolutely essential one, because for the attachment and removal of the sector-frames neither hand-tools nor any devices which would occupy any special amount of time are desirable, while as regards the second condition—viz, the easy, quick, and convenient cleaning not alone of the sectors, but also of the wheel itself—this is also a necessary condition.

In accordance with this reasoning, it will be seen that either of the two frames on each side of the machine when unclasped from the mudguard may be readily swung around the rear stay and cleaned on the inside and that the cleaning of the wheel itself is also facilitated by this operation. The patent is No. 622,997, April 11, 1899.

**Brewster and De Grout Join Forces.**

Philadelphia, April 17.—“Pop” Brewster, president of the Philadelphia Cycle Board of Trade, and Harry De Grout, ex-manager of the Union Cycle Manufacturing Company's Philadelphia branch, have combined forces, and will act as manufacturers' agents for three lines of medium-grade bicycles in addition to lubricants, Columbia cash registers and other novelties. Their headquarters are at 618 Drexel building.

**British Exports to India.**

The value of cycles exported from London to India, Burma and Ceylon during the past year was as follows: Calcutta, \$107,825; Bombay, \$160,760; Calicut, \$140; Colombo, \$21,400; Karachi, \$34,565; Mad-

ras, \$49,295; Rangoon, \$8,480. These figures do not include American and Continental makes.

**Train of Gears for Transmission.**

The accompanying illustration shows a driving gear which has been patented by John and James Riddett of Yonkers, N. Y., and assigned to H. C. England of Reading, Pa. It seems to be identical with the Gentry-Storrs gear in principle,

THE CYCLE AGE

though a pin-wheel is employed as the middle gear member in lieu of the straight spur wheel.

The New Zealand Touring Club has 1,070 members and more than \$1,000 in its treasury.

All cyclists in Calcutta are required to carry lights after sunset.

## CYCLOMETER MANUFACTURE

### Branch of Industry Monopolized by United States Through Excellence in Mass-Productive Methods

One of the most remarkable results of the consideration given to and ingenuity displayed in modern machine shop practice is the practical monopoly created by American mechanics and methods in the production of specialties. A monopoly, in this instance, is dependent for its existence upon economical and precise methods of production, rather than protection granted by the issue of patents or geographical situation of the factories.

Excellent examples of the condition referred to are afforded by manufacturers of fine tools, typewriters, sewing machines and cyclometers in their modern form. It is with the shop practice associated with the production of the latter that this article will deal.

#### Cost and Durability Main Factors.

Cyclometers, in more or less practical form, have been in existence almost as long as the bicycle itself. Riders of the olden time will remember some of the strange devices used in the days of the ordinary. They were high in price, weighty, and not always accurate—a combination which prohibited their use in large numbers. Even in those days, however, the desirability of a well constituted article at a reasonable price was generally admitted, and it only required the introduction of a sufficiently accurate recorder, possessed of the essential attributes of moderate cost and durability,

precipitate not only the commercial importance of the cyclometer business, but the degree of accuracy and precision observed in the manufacture.

No more forceful illustration of the service afforded the world by the growth and development of repetition methods of production could be cited than is afforded by the low cost to the customer of so intricate and scientific an instrument as the Veeder. As indicated in a former sentence, its introduction is as closely associated with unique methods of production as the design of the actual product. As a matter of fact, one is essential to the other—that is to say, in the absence of an absolute departure from former practices, the product of the Veeder, within the lines of cost demanded by the public, would have been impossible.

The Veeder company has erected at Hartford a handsome steel building especially for its work. It is, as might be expected, equipped in a manner fully representative of modern factory architecture, especially in the manner of securing ample lighting facilities. The heating is accomplished by hot air circulated through the hollow girders forming the frame of the structure. As a great deal of wood is incorporated in the building, precautions have been necessary to insure drawings, gauges, special tools and finished stock from the effects of a possi-

matic or otherwise, the cost of production would be so high as to be well-nigh prohibitive.

The process which has enabled the Veeder company to revolutionize cyclometer manufacture is, strange to say, one which is essentially associated with the foundry. In the first place it must be understood that the metal of which the instrument is composed is an anti-friction composition which, as usual with metals of that type, melts at a low temperature. Advantage has been taken of this fact to produce each part in the form of a casting. The process is such, however, that when removed from the mold

Drilling Various Parts.

its parts are perfectly clean and accurate, so that the machinery operations are confined to the removal of the runners and the boring and countersinking of rotating parts. It will be readily understood that this process is of such importance that the Veeder company has no desire to make it public property. It may be safely assumed, however, that the molds are of steel and partake to some extent of the same nature as a die, inasmuch as the metal must be under considerable pressure. It would not be a matter of surprise if it proves eventually that the operation consists of a combination of casting in chilled molds with an automatic press. Whatever the process may be, the results are of unusual interest and form.

The first illustration shows more clearly than is possible by descriptive writing the remarkable nature of the parts. Internal and irregular shaped gears are produced with teeth of theoretically correct formation, while the cases with the various projecting bearing surfaces are productive of such precision and finish as are not usually associated with the word casting.

#### Special Tools Throughout.

It must not be assumed that because the initial stage of manufacture of Veeder parts forms such a unique example of modern method that the machine shop is without interest. As a matter of fact, many of the machining operations are of exceptional interest to the student of modern shop practice. The principal machine tools consist of precision lathes and sensitive drilling machines. The chief interest in them consists, however, in the ingenious nature of the chucks, jigs and attachments with which they are fitted.

Some idea of the delicacy of the work handled on these machines may be gained from the accompanying half-tone engravings showing various stages in the process of manufacture. Although ingenious, the method of operating the above tools does not differ essentially from that followed in other branches of industry employing tools of similar nature.

In the department in which the rings which record the distance are finished,

to create a demand unexcelled in the history of the sundry business.

These facts render the introduction of the small and unique Veeder cyclometer of historic importance.

The principal feature of the introduction of the Veeder was the fact that not only in outline, but in method of production, the instrument was so distinctively American that, up to this time, no cyclometers are purchased in commercial quantities outside of this country. It is not strange under these circumstances that the export business in cyclometers practically equals in volume the demands of the home market.

It is intended that the following description shall enable the reader to ap-

ble conflagration. These take the form of a number of fire proof vaults for the retention of the respective items.

#### Accuracy in Foundry Work.

The most important departure from usual methods in the system of manufacture is that despite the precise nature of the machinery operations, the machine shop is by no means the principal feature; in fact, it is by limiting, to a large extent, the machine shop operations that the cost has been so greatly reduced. If the component parts which constitute a Veeder trip cyclometer were produced by preconceived methods of turning, stamping and machining, by milling or profiling, whether the operations were auto-

## Comfort

**T**HE comfort of a saddle depends largely upon intelligent construction in the earlier stages of the work. It is easy to make something and call it a saddle, but is it just as necessary to have a thorough *practical* knowledge of what constitutes a perfect saddle, before one can be made, as it is to have a thorough knowledge of cutting before a good and well fitting suit of clothes can be made. The lack of such knowledge results in botch-work, and we see lots of it, both in clothes and in saddles.

Neither of them will ever command the respectful consideration of those who know (and their name is legion) what constitutes good work, and the makers of them are soon relegated to oblivion.

It is the strongest and most convincing evidence of the perfection in *style*, *durability*, and *comfort* of the saddles produced by this company, that their goods command the admiration of more than eighty per cent. of the riders of this country and a very large proportion of those of other countries. Write us for information and catalogues. We shall be happy to furnish either or both.

**American  
Saddle Company**

608-613 American Trust Bldg.

Cleveland, Ohio

several unique devices are employed. The rings, like the other portions, are cast. In the finishing operations they are first mounted on a mandrel, enough of them at a time to fill the mandrel. Then the outer surfaces are turned in a speed lathe of special construction to insure uniformity of size. The mandrel is then mounted in a similar lathe running at lower speed, and the paper is wound on the rings in spiral fashion, a tenacious and damp-proof glue being used. The paper is next thoroughly cleaned at high speed by sand paper and the complete series is dried in ovens heated to a medium but steady temperature.

The next operation consists of separating the rings from each other and is accomplished by a rotating cutter located so as to move in a line with the work after the manner of a slide rest. The cutter is so arranged that it accurately spaces the rings and cuts the paper at the juncture of one ring with another. After that each ring is separately finished with sand paper while running at high speed.

#### The Printing Operation.

The figures are printed on small rotary machines of ingenious construction, and entirely self-acting in character. The type is cast solid with a revolving roller, which, after passing the ink roller, is rotated with its periphery bearing against the face of the indicating ring.

The crystals which protect the rings are made in the works, the necessary ac-

Whitney precision lathes, Hendy-Norton engine lathes, a Norton surface grinder and Brown & Sharpe universal milling machines. Contrary to usual custom, the tool making shop is situated on the top floor, the object, probably, being to obtain the best possible light. No piece workers are employed at the Veeder works, and in every department there are

Printing the Indicating Figures.

apparent indications of goodfellowship between employer and employe.

The conduct of the work throughout is of such a progressive nature as to insure a minimum of waste. The amount of work in hand and in stock is always indicated by a diagram which not only shows the amount of complete sets, but the relative output of one part with another. Electric motors are used for power purposes, each gang of tools being driven by a separate line-shaft connected with the motor.

The foregoing details will, in a measure serve to demonstrate the influence of the bicycle business in building up industries of a subsidiary nature which are worthy of notice both from an industrial and economic standpoint as well as because of their contribution to the science and practice of modern shop methods.

#### A Frenchy Trade Story.

In the weekly edition of *The Velo* of Paris is reprinted the old story of fine

erary style and elaborate description of the circumstances under which the author made his discovery. While in form a fancy and a hoax, it has repeatedly served the purpose of throwing suspicion upon American business methods, and being hoary with age, can hardly be printed for any other purpose.

#### Cycle Exhibit at Centennial.

The bicycle enthusiasts of Toledo are interested in the work of the Centennial exposition committee and the local organizations are taking the lead in the matter of having a mammoth bicycle display at the exposition. The various organizations akin to cycling have appointed a committee, to be known as the Centennial committee. This committee met April 4 for the purpose of organizing. It is the intention to have the exhibit entirely out of the hands of manufacturers, and in this way every branch of cycling would be given recognition. The object is to give a grand exhibit of cycling interests.

#### Novel Method of Recovering Oil.

A simple but unique plan for recovering the large quantities of oil used in the factory of the Grant Ball Company of Cleveland where it becomes mixed with the emery used for grinding and finally

Assembling the Cyclometer.

becomes so thickened with particles of emery and steel as to make it of the consistency of mud, has been hit upon. In the city where this material accumulated no other way of disposing of it could be found except to pay for its removal outside of the city limits, for it was of such a character as to make it practically impossible to dispose of it in any other way. Finally the managers thought of running it through a centrifugal cream separator. The plan was tried and is now regularly in use, the separator completely separating the particles of emery and steel from the oil, which runs out at a separate spout, so that it can be used over again, while the mixed emery and steel can be disposed of much more readily than when, as formerly, mixed with oil.

#### Not a Good Auction Town.

A bicycle repairman in Calgary, Alberta province Canada, writes that a carload of bicycles made in Toronto was taken into that town by a stranger who advertised them heavily and then held an auction sale April 12 and 13. Only four machines were sold the first day and five the second day. The machines were valued at \$50 for the diamond frame and \$55 for the drop frame models, but the bids at the sale began at \$30 and went down to \$22. The sale was brought to a sudden end.

Running Paper Strip Onto Gang of Rings.

curacy of dimensions being obtained by large grinding stones upon which the edges are beveled. In addition to being made a close fit, the glasses are cemented in place in order to insure the dust and damp proof qualities of the instrument.

#### Assembling Made Easy.

If any demonstration of the precise nature of the workmanship embodied in modern cyclometers were needed it would be afforded by the assembling department of the Veeder factory. Despite the intricacy of the mechanism, no tools other than those essential for assembling purposes, such as pliers, etc., are employed. The narrow margin for clearances is in itself a sufficient guarantee against any initial inaccuracy being overlooked.

It is an interesting fact that the Veeder cyclometer is quite free from springs or other controlling devices, the mechanism being of toothed gearing type as indicated by the accompanying drawings.

After the various parts have been assembled the instruments are subjected to a severe test by being mounted upon a machine on which they are operated by toothed gearing at a speed equivalent to fifteen miles a minute.

Many of the tools which have been referred to in the above are made in the factory. The tool room possesses an especially fine equipment, including Pratt &

Numbering the Casts.

American bicycles placed in the hands of professional burglars through the "courtesie" of the manufacturer on the sole condition that the burglars, when they should happen to be arrested, shall proclaim loudly in court what make and pattern of bicycle enabled them so often to elude their pursuers. The story is as old as our export trade to France, but is dished up with all the attractions of lit-

**T**HE rider of a National is always proud of his machine.  
 It's handsome and well made.  
 Like a good horse well groomed it adds to its owner's pleasure in simply being "all right."  
 The real satisfaction in the purchase of a National comes when the buyer finds that his first expenditure is his last. No repair charges or delays later to reduce his cash or spoil his pleasure.  
 One season on a National and he says—  
*A National Rider Never Changes His Mount.*  
 Better join the procession.

# Selling to Women

Women are great shoppers—great buyers. They want the most—the best—for their money.  
 You can not show a woman an out of date bicycle and expect her to buy it.  
 To get her trade you must give her more for her money than your competitors can give her.  
 Particular women—those who want a beautifully designed and finished bicycle—a graceful mount—can be satisfied with the

## ANDRAE model 41

They will compare it with other makes at the same price. They will see its advantages—its better qualities—and then they will buy it.  
 But that's not all. They will send other customers to you. They will show you that satisfied customers are good advertisers.  
 Write us about our Model 41; it is the finest ladies' model in the market.  
 If you will send us your name and address we will make you a subscriber of our monthly paper, "The Andrae Agent."

## THE CRAZE FOR HIGH SPEEDS

### FRENCH WINDSPLITTER WAGONS

#### Wood Being Abandoned for Metal in Construction of Motorcycle Bodies— Novel Electrobat.

Until last summer it was the usual thing in France for those who wanted a motor vehicle to purchase the motor mechanism which they preferred and take it to a carriage maker to have the wagon body made. The result was usually that the carriage maker acted upon the ideas traditional in his trade and produced a carriage more or less on conventional lines and more or less unsuited to the requirements of mechanical power, says Locomotion Automobile.

#### Bollee Sets the Pace.

Then suddenly appeared the Bollee vehicle, which took part in the race from Paris to Amsterdam. The inventor had cared very little for conventional ideas. His vehicles did not correspond to any of the known and catalogued styles. They looked like the fishing barges used in the shallow waters around Newfoundland. The radiators extended freely on both sides in front from the cooling jacket, and the whole was dished out to the public in metal finish with aluminum trimmings and painted in ribald colors.

#### Carriage Makers Follow Suit.

That was the first step in crime against sacred tradition, and to this step may be traced the present rapid and revolution-

Count Chasseloup-Loubat's Mile-a-Minute Vehicle.

ary development in the building of motor wagon bodies. It was the farewell to laboriously curved and dovetailed wooden boxings, panels and ebony trimmings. All must give way to metal. Aluminum is king. When the elder Bonogne, who has solved the problem of being as fine a motor vehicle maker as he is carriage designer, conceived the idea of using aluminum panels first in steel frames and subsequently in frameworks also of aluminum, he had no suspicion of the revolution which he was accomplishing. After him followed other and younger men. There is still a little wood left in the wagon body proper, but the desire to dispense with even that is growing.

#### Looks Like Torpedo Maker's Work.

Says one of the best known carriage builders on this subject: "Now I am a coppersmith. Automobilmism means kettle making. Talk to me about angle-irons, rivets, gaskets, stop-cocks, packings and reinforcements and I will answer you."

"And that disgusts you?"

"Not in the least. I have been obliged to go through a short apprenticeship and hire a few special workmen. A little trouble in the beginning, but today the die is cast and all goes swimmingly."

It is in fact only necessary to cast a glance at such vehicles as that on which Chasseloup-Loubat made his recent record, or that which Jenatzy is building or the Paiva wagon and several others un-

der construction, to perceive that they might be more readily made by a torpedo manufacturer than by an ordinary carriage maker.

In the accompanying illustration is shown the Chasseloup-Loubat electric vehicle here referred to which was constructed by Mr. Jeantaud and on which its owner made a kilometer, flying start, in 3 4-5 seconds on March 4 this year, at Acheres, France.

#### Olds Vehicles to be Pushed.

A Detroit syndicate capitalized at \$500,000 has secured control of the Olds Gasoline Engine Works of Lansing, Mich. Ransom E. Olds, president and manager of the old company, will bear the same relation to the new company. The new company has been formed in order to manufacture Olds motor vehicles on a large scale under the Olds patents and the Olds motor-trucks under a patent which is now pending, and a factory will be built in Detroit for this purpose. The Lansing plant whose capacity is fully engaged in turning out Olds gasoline engines for other than motor vehicle purposes will be continued in operation for the present.

#### Electric Cabs for Chicago.

The Illinois Electric Vehicle Transportation company is being formed with a capital of 25 million dollars under New Jersey laws for the purpose of supplying Chicago with electric cab service. The new company will start with five percent of the nominal capital actually paid in, and the balance will be called for as

circumstances may dictate, thus giving the stockholder a chance for a progressive investment. The company is to be an organization vassal to the Electric Storage Battery company of Philadelphia and the Electric Vehicle company of New York, from which the batteries and cabs are obtained. These parent companies hold stock in all the subsidiary companies formed, of which that for Illinois is only one of many, and collect a royalty on the gross business done by them. The liability of stockholders is limited to ten percent of the face value of stock.

#### Cycle and Motor Cycle Races.

The motor cycle is becoming an indispensable feature in cycle racing in France and all the road races are now run off in two sections, one for ordinary bicycles and the other for petroleum machines. The pacing, too, is done very largely with autocars. In the annual race from Paris to Roubaix the success was due almost entirely to the motor cycle and the autocar pacing. Close on sixty motor cyclists took part in the event.

#### Electric Cabs in Paris.

The cab company in Paris, France, has finally succeeded in placing ten of the much heralded electric cabs at public disposal. They were placed for hire on Easter Sunday, April 2 and have been much in demand. They run, satisfactorily.

## AUTOMOBILIST EXPERIENCES

### EXPRESSIONS FROM THE USERS

#### Brisk Demand Leads English Manufacturers to Slight Minor Points in Construction—Troubles Result.

In this country the great majority of motor vehicles in practical use are still of the electric type, which are nearly perfect and free from trouble within their limited range of travel. Little is heard from the persons who buy them. The number of hydro-carbon vehicles and steam vehicles that have been subject to prolonged and hard usage is very small and the prospects are that more real experience will be accumulated during the summer of this year than it has been possible to gather from disinterested sources in all previous time from the "commencement of eternity" to date, so far as motor vehicles of United States manufacture are concerned.

In the absence of home data the communications from foreign drivers and owners of motor vehicles possess a certain interest, foreshadowing, as they do, to some extent the development in the public attitude to automobilism which may be expected here. In this respect the following extracts from letters written to The Autocar speak for themselves:

#### Speed on the Track.

Some time back Mr. Wridgway's statements as to the speed he could make on his motor tricycle were questioned, but his Easter Monday performance at the Crystal Palace track, when he beat the French kilometer record holder, Monsieur Rigal, and covered over twenty-nine miles in the hour, is a very conclusive refutation to the persons who questioned Mr. Wridgway's word. This performance for a motor tricycle on a track would be equal to about thirty-five miles an hour on a "straight away." The vast concourse of people who flocked to this meeting is strong testimony of the interest taken in motor races in England, and we hope to see considerable developments in this line, especially as the law prohibits fast speeds on the highway.

London, April 4.

PENNINGTON & BAINES.

#### Practical Experiences.

Like Mr. Collins I have had considerable trouble with the cylinder joints on a Benz car. Although I do not doubt that red lead is an effective remedy, it has other disadvantages which make it almost inadmissible. For instance, if a joint went on the road it would take a couple of hours or more to chip the surface clean, whereas if asbestos sheet is used and well oiled, and a spare joint carried ready on the car, it could be re-made in twenty minutes.

I quite agree with the suggestions made by Mr. Hope and others as to using boiling water on cold mornings, and also with Mr. Cragg's criticisms.

RUSSELL.

Maidenhead, March 29.

#### Electric vs. Tube Ignition.

Having read with interest the opinions of your correspondents upon "Electric v. Tube" ignition, I thought my actual experience of the tube method might interest some of your readers. I bought a Daimler in May, and ran her at Liverpool during the trials, and afterwards at Yarmouth and elsewhere, up to present date having covered over 9,000 miles. When I left the works at Coventry I was given six wicks, in addition to those then in the burners, and I have some of them still by me. This fact speaks for itself, as anyone who understands tube ignition knows he will have trouble if his lamps do not burn properly. How is it these wicks have lasted so long? Simply by occasionally taking them out and washing them in clean spirit, and always using clean and good petrol. I have just completed a seven hundred miles run without the slightest hitch, having encountered all sorts of weather.

Lowestoft.

O SIMPSON.

#### Nine Months Experience of Medicus.

In your issue of March 11 it was suggested (in reply to my communication) that (1) my piston rings were worn because of deficient lubrication. That was not the case; I particularly looked after the lubrication myself. From the very first I had great trouble with them. (2) The cause of jarring, etc., was due to deficient greasing of the pulleys. I may say that the cause was as I stated, the countershaft revolved in the collar of the central ball bearing; the

shaft at that place was actually worn bright. Perhaps Mr. Buttemer will suggest some good reason why that bearing should not be firmly fixed. My own experience compels me to come to this conclusion, that the "Ideal" of the '98 type, as sent out by the makers, was quite unfit for the daily use of a medical man; besides, in justice to those who are contemplating buying a car, those of us who have already bought one should tell the plain unvarnished truth about our experiences, then The Autocar will be of great practical help. It is ridiculous for anyone to calmly state that the "Ideal" is a good car if only properly looked to. She is a good car when one has fitted the following: New coil and wires, lever for regulating time of firing, new hand brake with rubber blocks, Brampton chains, pinion and sprocket wheels, chain lubricators and mudguards, new grease pots, piston rings, ignition plugs, band brakes, studs and nuts, tires, and, finally, altered the belt guides.

Even then with all this extra money spent on her I do not consider she is strong enough, or her engine powerful enough, for use over rough country roads during the winter months. MEDICUS.

**Some Technical Inquiries.**

Would some of your numerous mechanical readers kindly assist me to information I ask below re light spirit motors:

First, whether the mixture of vapor and air is subject to the same laws as a perfect gas; if so, give formulae for working.

Second, relative capacity usually used of compression chamber to stroke, not length of cylinder. Proportions of mixture, pressure after compression, taking into consideration the heats of gases, rule for finding same, amount of rise in temperature of cylinder after working, say, fifteen minutes without jacket, and what effect the temperature of cylinder has on gases when drawn cold into cylinder, pressure after explosion for different mixtures, and method of calculating, same, if any, from pressure before explosion. If firing is by tube, at what pressure will a certain mixture explode, and what mixture will it be for that pressure when tube is at bright red heat; also is it usual to so arrange proportion of cylinder capacity and compression space as to fire before top center, on center, or after center, supposing speed to be for explosion five hundred per minute, gear ratio two to fifteen, speed of vehicle fifteen miles per hour, and weight of vehicle and motor one hundredweight. A book containing the above would serve all purposes if any reader can tell me of one.

EXPERIMENTER

**Interchange of Ideas.**

I have to thank Mr. Sinclair for his letter in your last issue. He has not cut quite so deeply into the Benz pie as I have; if he had done so he would find, as I have found, that whereas there is a maximum of trouble, worry and expense to be experienced with a Benz car (I speak of cars delivered prior to 1899) for some time after delivery, when this has been got over they run excellently with a minimum of trouble and expense, and in fine do command one's admiration.

I beg also to thank one or two gentlemen who have kindly written to me privately to thank me for calling attention to a few improvements needed in the Benz car.

Birmingham, April 4. A. C. CRAGG.

**Saturday Runs.**

Several of my friends have asked me to get up some Saturday runs, so (weather permitting) on Saturday next, the 15th inst., there will be a run to Effingham, leaving Hyde Park corner at about 2:15, via Sloane Square, along King street, Putney bridge, Wimbledon Common, Kingston Vale, Kingston Surbiton, Ewell, Leatherhead, Bookham, Effingham. Hotel Blucher for five o'clock tea.

A few seats can be booked at a guinea each.

Further particulars of Hewetson, Ltd., 6 Dean street, Soho, W. H. HEWETSON. April 7.

**New Positive Ignition Coil.**

A Ruhmkorf coil designed for ignition in hydro-carbon gas engines has been placed in the market by Varley Duplex Magnet Co., 138 Seventh street, Jersey City, N. J. It requires from 4 to 6 volts and is capable of a spark 2½ inches long. It is said to produce positive ignition with the customary distance between terminals.

**Cooling Problem With Gas Engines.**

A French writer proposes to make the inner wall of explosion chamber and cylinder in gas engines very thin, surrounding the thin metal with a sieve-like thicker wall to afford the necessary strength to resist the force of the ex-

plosions. By this means he expects to obtain rapid cooling with or without additional radiating wings which should lead the atmosphere into constantly renewed contact with the metal to be cooled.

**Elliott's Gas Engine Carriage.**

W. L. Elliott of Oakland, Cal., has constructed the motor carriage which is shown in the accompanying half-tone and has given it hard and prolonged tests which convince him that it is a thoroughly practicable vehicle. The motor is a two-cylinder 4 H. P. hydro-carbon en-

gine, which will run the carriage 18 miles per hour on level roads and make it ascend 15 percent grades with two passengers on board at 4 miles per hour. The exhaust is muffled and the carriage is so much like a horse-drawn vehicle that horses hardly look at it. The price at which the maker sells this style of carriage is \$1,200 complete.

**Carbonic Acid Gas for Inflation.**

A tire inflater is on the market now in Paris, which is charged with carbonic acid gas sufficient for a dozen tires. It is in the shape of an ordinary inflation pump of the hand size and is in fact a miniature inflation tank which the rider may conveniently carry in his pocket. The "pump" is charged at any of the beer saloons where liquid carbonic acid gas is employed for drawing beer or effervescent drinks. These large tanks containing 22 pounds of carbonic acid gas are also placed at the disposal of cycle depots or cyclists at the price of 50 francs (\$10) and one charge in them is sufficient for 1,000 tires. They are recharged for 10

francs. The illustration shows the act of charging a bicycle "pump" from one of these tanks. For inflating the tires of motor vehicles a larger size of "pump" is used.

**Is Petrol a Good Word?**

It is asserted that the gas engine, the gasoline engine, the hydro-carbon gas engine would sound sweeter under the English name petrol-engine. It would sound less dangerous to the broad public who associate the word gasoline with the extreme of caution for cooking purposes and with positive danger for locomotion.

At the Charles River Park trials it was noticed by hundreds of people that

the gasoline used for heating the boiler of the Whitney steam engine motor burst into an uncontrolled flame at times owing to faulty arrangement or workmanship, and it was the erroneous impression created among most of the lay spectators and also among some of the reporters, that the vehicle was gas-engine driven and that similar things might occur with any gas-engine driven vehicle. While an explanation would readily make it clear that similar mishaps are mechanically impossible in hydro-carbon engines and quite unnecessary with steam engines, though their boilers be heated with gasoline or petroleum spray, the most practical way to forestall misconceptions among the public would probably lie in the adoption of the word petrol to designate all internal combustion or explosion engines. It is more popular than hydro-carbon and less suggestive to the imagination of the timid than gasoline.

**Automobile Recharging Stations.**

A new company has been formed in Paris which proposes to establish along all good and popular roads leading out of the city little electrical stations where motor vehicles and motorcycles can be recharged. These will be placed at intervals of ten to twelve miles and will be equipped with all the supplies and appliances for recharging electric, petroleum, benzine and other motor driven vehicles. There will also be established in connection with them small restaurants, repair shops, medical depots and exchange stations for bicycles and motor vehicles.

Park commissioners in Buffalo have awarded a contract for park carriages to the National Motor Transit Company who will use the Haynes-Apperson pattern of gas-engine carriages. It was considered impracticable to use electric vehicles because these, in the opinion of the commissioners, cannot be operated profitably at a five cent fare per passenger.

The Woods Motor Vehicle Company has been incorporated at Trenton, N. J., with capitalization of ten million dollars. The leading spirit of the company is C. E. Woods of Fischer Equipment Company of Chicago.

The price question has swelled the demand for motor tricycles and small motor vehicles in France and England. It is beginning to create inquiries for motor bicycles and tricycles in United States.

De Dion & Bouton have abandoned the radiating wings heretofore employed by them for cooling the explosion chamber and cylinder and have returned to the use of water for this purpose.

The business of the Rubber Tire Wheel Co. of Springfield, O., has been sold to the New York Autotruck Co. for a consideration named at \$250,000.

Berlin boasts of fifty cycling clubs, but that is a long way behind London, which boasts of over 200 clubs with headquarters in the London district.

The Bavarian army has been supplied with cycles weighing about 22 pounds, fitted with 20-inch wheels and low gears.

La Locomotion Automobile, the oldest motor vehicle journal in the world, prints only four thousand copies per week.

A motor carriage valued at \$2,818 was exported from this country to Madrid a fortnight ago.

A. D. Stealey of San Francisco is building a motor bicycle to the order of a local cyclist.

# THE PASTIME AND SPORT

Balfour's  
Interest in  
Cycling

At the "coming-of-age" dinner of the National Cyclists' Union of England in the latter part of March, Henry Balfour, leader of the House of Commons, made an address upon cycling and the influence of the bicycle on modern life, which has been copied in all English speaking countries of the world.

Mr. Balfour is president of the N. C. U. and as such was slated for the speech, but when it became known that an important debate in parliament was to close that evening, and that Mr. Balfour would necessarily wind up the discussion with his reply to the criticisms to which the bill has been subjected, there were not wanting many who expressed an opinion that his presence at the dinner of the N. C. U. was an impossibility, and that the function would in a manner resemble the play of Hamlet without the Dane, but he had accepted the Union's invitation, he had fixed his own date, and though the delivery of a great and important speech upon one of the most important measures the government had introduced made it difficult, Mr. Balfour kept his word, and proposed the toast allotted to him in one of the most graceful and comprehensive speeches ever made in connection with the pastime of the sport.

Ninety-nine out of a hundred lesser men would have considered the circumstances ample to have excused them from even graver engagements. But Mr. Balfour evidently felt that the occasion was one upon which he should make an effort to be present, albeit at no small inconvenience to himself and to his party, and so he went, was most heartily welcomed, and certainly won the heart of every cyclist in the room.

Limiting  
Continuous  
Racing

Through the signing of the Collins bill by Governor Roosevelt of New York all contests of human speed and endurance whether afoot or awheel are limited to twelve hours' going a day. This is a statute far more stringent and less easily evaded than the Illinois enactment seeking the abolition of six-day racing.

So long as man has ambitions to succeed in contests of strength and endurance there will be a desire to test his limit against others, whether the majority of the public think it foolish and brutal or not. Six-day bicycle racing has yet to score a fatality. Its winners and leaders appear year after year to go further and faster and show greater endurance than ever and to demonstrate their superiority over the newcomers who are vigorous in a strength and health as yet unimpaired by these contests.

Illinoisans suspect an inside reason for their anti-six-day law and New Yorkers think they can trace theirs to personal revenge against the "outlaw" movement.

Twelve-hours-a-day racing will have to be accepted as a substitute for 142-hour continuous grinds, under the present Collins act, but twelve hours a day, for six days makes a sufficiently high-pressure contest.

Titled and  
Sweepstakes  
Races

The early entry blanks and official announcements of the programmes of meets to come present an innovation in giving to the principal races distinctive names. The tendency toward the time-honored practices of the turf is further shown in the establishment of sweep-

stakes, wherein the first prize is enlarged by embracing the entire added money, the place prizes being obtained from a division of the entrance fees. The importance of races will be increased in the public estimation by the featured races bearing titles. It will also assist the memory and we will no longer have to identify performances by referring to "the mile open Eddie Bald won at Boston" or "the two-mile handicap Arthur Gardiner captured at Louisville." The value of names to turf events is unquestioned. The greatest contest in foot racing is remembered as "the Sheffield Handicap." In cycling the "Austral" and the "Zimmy" made these great Melbourne and Paris contests known the world over, just as was the great "Quill" \$2,000 handicap in this country two years ago. In England some big races bear the names of the cups offered. Now we are to have the Wild West Handicap and the Ambrose Dash, the Atlantic Sweepstakes and the Seaside Dash, and the Great Peace Jubilee Handicap.

These names appeal to local pride, help identification and add to advertising importance. It is an innovation that has doubtless and deservedly come to stay.

The Need  
of Motor  
Pacing

Motor pacing may come and in fact may have to be adopted to save the middle distance paced racing game. It is not because man pacing is in itself impracticable or that it lacks elements necessary to promote speed, arouse excitement or sustain the interest in these contests. It is solely a question of expense.

The maintenance, transportation and incidental expenses of a pacing team of thirty men is not far below \$1,000 a week. The American Cycle Racing Association's team, which piloted Michael, Titus and the two Taylors last year cost \$8,000, and this sum has had all to do with putting this association out of the outdoor game for the coming season. The N. C. T. A. brigade, which paced McDuffee and Linton, met with equal financial disaster despite the fact that in most cases it captured the big \$2,500 purses. Neither association can be tempted into another trial, nor will the manufacturers consent to be the "angles." So it seems not only likely but certain that continuous middle distance racing cannot be expected the coming season and that in this line nothing can be looked for beyond a few big matches with pacing teams gathered especially for the occasion. "Pop" Elkes says he will have none of it for Harry unless some one will supply the pacing and unless this be forthcoming from the outside he will turn his speedy boy to the sprints and the big handicaps for a living. Floyd McFarland declares he will not be tempted from his former lucrative line of racing by his single success against Harry Elkes in California. Michael is out of the game until he proves that his pigskin ambition cannot be realized. Somebody has been jollying Nat Butler, that most consistent and constant of money winners at the sprints and handicaps, that he is a natural born pace follower and that pace will be furnished him. This leaves only McDuffee and Major Taylor really in the game. The former is sure to stick to it and seek a living through the occasional middle distance matches that may be promoted. Taylor is ready on anything in the game; for he can follow pace in matches, go for records at any distance behind the big machines and tackle the sprints and han-

dicaps with assurances of a greater measure of all-around success than any rider in the world.

We have some motor pacing already on tap here. Fournier showed a mile indoors in California in 1:32 and will take to himself in his brother a side partner to furnish pace in middle distance matches. He purposes to attach the foreign-patented contrivances to the lighter American machines, though it would seem that his present outfit is fast enough for all purposes. If his motor pacing proves enough of a success early in the season to establish it as a feature or the solution of the middle distance game here, either more machines will be imported or our American makers will turn them out at home without much delay.

In England there have been recent trials of motor pacing that have proved most encouraging to its adoption. At Crystal Palace F. W. Chinn went two miles in 4:11 behind a petroleum tandem and the same day R. Palmer rode five miles behind the same machine in 9:24. It being early in the season and the game being comparatively new, there was no attempt at high speed, the men riding merely "to see how it went." A more important trial was made at Woodgreen track on March 31, when Linton beat Chase in a ten-mile match behind petroleum tandems in 18:53 2-5 with a gale blowing.

Local  
L. A. W.  
Organization

Directly in the line of conveniences to be furnished members to secure their continual allegiance to the L. A. W. and the addition of new members is local organization. This was a pet project of ex-President Potter and is deservedly to be pushed by his successor, President Keenan. But the idea can be carried much further than the mere establishment of recruiting stations and headquarters for convenient enrollment and renewal.

Headquarters might be established that would serve primarily as clubs for resident members and refuges for touring and visiting L. A. W. members. The club idea is not developing with anything like the increase in the cycling population, but thousands who might not care to undertake the expense or fancy the attractions cycle clubs have to offer still might welcome a less ambitious and expensive place of meeting such as the local L. A. W. headquarters could offer with its maps, road books, cycle journals and good fellowship of companion wheelmen as sufficient attractions. Recruiting and renewals would follow, for the convenience of a meeting place would be found among the foremost inducements to become L. A. W. members.

## Attitude of the I. C. A.

New York City, April 17.—It is learned from authentic mail advices received last Friday that at the meeting of the International Cyclists' Association a most important understanding was reached in the matter of the future recognition of one of the warring race control bodies in this country, despite the official announcement of the action of the meeting to the effect that the I. C. A. could not consistently interfere in the cycle racing complications now existing in this country, and that the status quo must be maintained. It will be remembered that the Canadian Wheelmen's Association, in session at Toronto the day preceding,

adopted a resolution, which was cabled to Paris, requesting that the L. A. W. be required to make good its claim to complete control of the sport by July 1, and failing in that that all N. C. A. riders be granted racing privileges in affiliated countries pending the settlement of the racing controversy in the United States.

As a result of this advice of the Canadian body, the I. C. A. board agreed that in event of the N. C. A. establishing an indisputable supremacy over the L. A. W., the latter body would be asked to give up the control of racing and, if necessary, compelled to do so in time for the Montreal world's championships not to suffer from the state of affairs. It was also agreed that forthcoming events in this country would be watched closely and should it be deemed advisable a mail vote of the executive board would be taken to bring about any desired result which might be found necessary, so that the Montreal events would not be handicapped. At the Paris meeting some of the delegates were in favor of striking the L. A. W. off the membership list and affiliating with the N. C. A. at once. Such action, in the opinion of Secretary Sturmey, would have been illegal at that time, and after an animated discussion the subsequent conclusion found favor as being the logical solution of the difficulty.

### AMERICANS RUN SECOND

**Banker and Starbuck in Events in Paris—Grogna Wins Great Prize of the East.**

The Great Prize of Easter, the first of the big annual meets of France, was run this year at the Prince track in Paris April 2 and 3. The weather was perfect and the attendance was very large. Fifty riders competed for the great Easter prize, America being represented by Banker, Hills and Vanoni. Banker was heartily received, it being his first appearance in a Paris race meet since 1895. He was not in very good condition, but succeeded in winning his heat and the semi-final and lost the final by only a length. The race was run in eight heats at 1,000 meters, Banker, Parlby, Grogna, Gougoltz, Cornet, Bourotte, Felix Henry and J. B. Louvet being the winners. The three semi-finals were won by Parlby, Grogna and Banker. The final was paced after the American style by Collomb, who dropped out on the last turn. At 100 yards from the tape Grogna started his sprint and crossed the tape winner by a length, with Banker second and Parlby third. Time, 1:24.

The 1,500-meters handicap was run in seven heats. Banker ran second in his heat from scratch, Guiguard qualifying. The final was won by Gougoltz from 40 yards, Louvet running second from 35 yards and Carmant third from 55 yards. The time was 1:52 2-5.

Fourteen teams took part in the 2,000-meter tandem race, which was run in three heats, won by Domain and Banker, Carmant and Mathieu and Deleu and Leclercq. Six teams started in the final. At the bell Deleu and Leclercq started to sprint, but Domain and Banker went after them and succeeded in passing them, but in the homestretch Carmant and Mathieu made a splendid fight against the French-American team and finally crossed the tape in the lead by the width of a tire.

There were fifty-eight starters in the scratch race for class 2 riders, which was won by Bourotte, with Mathieu second and Leclercq third.

Starbuck, Bourotte, Lambrechts and Cissac were the only starters in the 10-kilometer electric paced race. At the pistol the four machines started off with their men at full speed, Starbuck taking the lead. But in the third Bourotte gained the lead, which he increased to

550 meters at the tape. Starbuck finished half a lap ahead of Lambrechts, with Cissac fourth. Time, 11:46.

### ANNUAL MEETING OF I. C. A.

**International Body Decides Not to Recognize National Cycling Association Just Yet.**

The annual spring meeting of the International Cyclists' Association took place in Paris April 1. Eleven delegates represented France, England, Belgium, Denmark, Norway, Scotland, Switzerland, Holland and Italy. E. Staal of Denmark presided, and E. Sturmey from England was secretary. It was a long and exciting meeting and more than thirty important questions were discussed and decided.

The American racing situation was reviewed at length and it was finally decided that the status quo would be maintained; that is, that the League of American Wheelmen would continue to be recognized as the official body governing racing in the United States until further developments and decision.

Following is a summary of the more important business transacted at the meeting:

Announcement made that the American Cycle Racing Association had withdrawn its suit against the I. C. A. and Secretary Sturmey.

The German Wheelmen's League announced that it renounced control of professional racing in Germany and Austria, concerning itself hereafter only with amateur racing. These two countries, thus being without any organization to govern the pros., the I. C. A. decided to issue licenses direct to professional riders in those countries.

Report made of the failure of the New Zealand Cyclists' Alliance which was affiliated with the I. C. A. at its last meeting.

Arranged details concerning the international championships to be run at Montreal in August.

German Wheelmen's League announced that the profits on the last championships run at Vienna amounted to \$2,895.

Affiliation of the League of New South Wales Wheelmen accepted.

Report upon the decision of the Dutch Wheelmen's League to give up the control of the sport in Holland and the application of a new organization for affiliation in place of the old body accepted.

Decided that the match between the professional and amateur mile world champions shall not take place on the same day that either of the mile championships is run.

Adopted a resolution expressing the desire of the I. C. A. that all national championships be run before August 1 of every year.

Rejected the proposition that the profits of the international championships be divided in proportion to the expenses incurred by the several countries in sending riders to the meet.

Established a new classification for records made with the aid of wind shields.

Decided that no rider could represent at the international championships any national organization except that of the country where he was born unless he had lived one year in a foreign country and become a bona fide resident thereof.

### PARIS-ROUBAIX ROAD RACE

**Champion Surprises Everybody by Winning Great Event on His Debut—Motor Tricycle Race.**

The fourth annual Paris-Roubaix road race was run April 2. As it was the first big road event of the season, it attracted much interest, particularly on account of Bouhours and Champion, who were to try their fortunes for the first time on the road. Thirty-one starters were pushed off. They were paced by motorcycles.

Champion's debut was more than had been expected, as he won the race in excellent style, covering the 166 miles in 8:22:38. Garvin, the winner of last year's race, quit the contest in the first stage to Beauvais, owing to an accident which delayed his motor pacing machine for twelve minutes, and Champion passed that station first, his time for the forty-seven miles being two hours. Champion was also first to reach Amiens, 85 miles,

in 3:28:00. Bouhours was only two minutes behind and seemed confident of winning, but less than five minutes after the start from there the motor machine he was following ran into a spectator, who turned a complete somersault, and upset itself so that Bouhours ran into it and injured his elbow. Champion continued to gain steadily and arrived at Roubaix with a lead of 23:40 over the second man, Bor, while Garvin, Jr., was third in 8:46:17.

The race for motocyclists had fifty-seven starters, all on petroleum tricycles, and all started at the same time. It was the greatest racing spectacle ever seen in France. All the best motocyclists, both old and new, were entered. The first to meet with an accident was the former world's champion, Rene Kuhling, who was obliged to give up the race about fifteen miles from the start. Osmont, Vasseur and Beconnais were first to reach Beauvais. They arrived together in 1:34:00. Between that city and Amiens many accidents forced several good riders out of the race. Vasseur and Osmont reached Amiens together in the lead in 2:07:00, but at Arras, 127 miles, Osmont had the lead, being six minutes ahead of the second man, and Vasseur had dropped back. Osmont arrived at Roubaix, the finish, first, having covered the distance in 5:35:30, at an average speed of almost thirty miles an hour. Beconnais finished second ten minutes later. Girardot was third and Vasseur fourth.

### TRAINING AT FOUNTAIN FERRY

**Crackajacks Gathering at the "Old Kentucky Home"—Low Gears and High Speed.**

Louisville, April 19.—Twenty racing men will be training at Fountain Ferry track before the close of the present week. Half that number have already arrived, including many of the most prominent ones, and many dark horses for the circuit work of '99. Tony Landen-wich says that things were never more promising than at present for the greatest camp over which he has been the presiding host. Owen Kimble, who opened this track to the outlaws through his early attempts to train here, has been joined by a number of good ones. From California the McFarland-Stevens combination arrived last week, together with F. Ed. Smith, who trained them last year, and "Jim" McFarland, a brother of the rider. Bald is expected early this week and Tom Cooper and Earl Kiser are already here. The last two were refused admission to Chester Park track at Cincinnati, that track having been closed to the N. C. A. riders pending a decision regarding the future policy to be made within a short time. From Chicago the newly formed Cleveland team is expected this week. Arthur Gardiner is the star of the new team with "Jimmy" Bowler and John Fisher as his mates, all Chicagoans. Gardiner will work the Grand circuit of the N. C. A. while the other two ride in the west under the same control. Harley Davidson and Angus McLeod, the Canadian champions, reported at Hot Springs, are expected also this week. Charles Porter, the former amateur, is training here for a middle distance career in the professional ranks. A letter received from August Mertens indicates an intention of that rider to join his old-time mates here in an attempt to gain a membership in the Union from which he was barred last fall owing to his stand taken at Philadelphia. J. S. Johnson and W. E. Becker from the Twin Cities will also be here soon, and Johnson's team mate, Ben Munroe, from Memphis, will join him here.

The work at present consists of five to eight-mile rides morning and afternoon by the entire bunch. Small gears are being used generally and yet the pace is oftentimes as fast as two minutes with

sometimes a fast finishing quarter, but more often not, as few of the men are equal to a hard sprint yet. Kiser is working out the medicine which he took the past winter to rid his system of the malaria which ruined his chances last season. Cooper is in fine shape for hard work and says that he is now rid once and for all time of the troublesome boils which ruined his chances for the two past seasons. McFarland and Stevens suffered from colds contracted in the indoor races in California and both have started in at the beginning and will work up to the great speed of which they had plenty out on the coast. Kimble is twenty pounds lighter than last year and is going great guns. The other riders watch him with interest, believing that in the Kentuckian they have perhaps the hardest nut of the season to crack.

McFarland trains for middle distances and will soon be following pace as it is his intention to take on Elkes for three races this year at different distances and to race Gibson May 30. He will pay no attention to McDuffee, who wants a race with him but will ride under L. A. W. sanction while McFarland will race with the N. C. A. riders.

The weather thus far has been all that it should be and four or five weeks of the present state of things will put the men right on edge. It is plainly apparent that the '99 circuit chasers will travel seconds faster than ever before.

#### Pennsylvania Path Bill Passed.

Philadelphia, April 17.—The Parshall bicycle side path bill, which passed both houses of the state Legislature earlier in the week was signed by Governor Stone last Wednesday and is now a law of the commonwealth. Boiled down, the new law provides that when twenty-five freeholders, who are also wheelmen, shall present a petition to the court asking for the building of sidepaths along certain roads, such paths shall then be constructed, under the supervision of a road supervisor appointed for the purpose, the funds to build and maintain the paths being provided by an annual tax of \$1 imposed upon each wheelman resident in the county. The new measure also provides for the appointment by the court of three resident wheelmen to act as side-path commissioners (who shall serve without compensation) and for the punishment by a fine of \$10 or 30 days' imprisonment, or both, of all horsemen or drivers who shall willfully injure or obstruct any sidepaths constructed under its provisions. Preparations are being made by parties of wheelmen in at least a dozen counties in this state to petition for such sidepaths before the close of the present month.

#### Momo in South America.

Momo, the Italian, has been having quite a triumphal march in South America since he landed there. He has at last, however, been defeated by Oliveira, the Brazilian rider, in the South American Brassard. It is claimed for Momo that he was suffering from the results of a spill, but it is only fair to the winner to point out that the time ranks as a South American record. At the close of the proceedings Momo challenged the Brazilian to a match race.

#### Easter Meet in London.

The announcement of the first important motorcycle match race to be run in London attracted nearly 12,000 spectators to the Easter meet in Crystal Palace. Wridgway and Rigal rode against each other for an hour on the "infernal machines." At the fifteenth mile the Frenchman's machine went wrong and caused him to lose eight laps during which the public jeered him without

mercy so that soon after resuming the match he left the track, while Wridgway finished the hour, covering about 29 miles 1,600 yards.

Palmer and Chase rode a thirty-three-mile match for the Century cup, paced by motorcycles and tandems. The race was very fast from the start, the lead alternating until at the tenth mile Palmer gained a lap. Chase then went after him and for fifteen laps forced him to take the outside but in the twenty-second mile Palmer gained another lap and finally won with two and a quarter laps lead. His times were: ten miles, 18:25 2-5; twenty miles, 39:17 2-5; thirty-three miles, 1:03:01.

#### Birmingham Two-Day Meet.

A two-day meet was held at Birmingham, England, April 2 and 3, in which most of the English crackajacks took part. The principal event, the mile race, was declared no race because the time limit set was exceeded. The half-mile scratch was won by Howard, with Bocquillon second, defeating Jenkins, Chinn, Camp, Reynolds and Scott. Camp won the mile scratch race with Bocquillon second, Chinn third and Green fourth. The ten-mile scratch went to Green, Camp running second and Jenkins third. The mile handicap run the second day went to Howard, with Camp second and Hall third. Platt-Betts and Chase rode exhibitions.

#### Sunday Match in Galveston.

Jack Prince seems to be making a success of Sunday racing in the south. He ran a meet in Galveston, Tex., April 9, and drew a fair attendance for the place and programme. The most interesting event was a ten-mile match between the two "Bobs"—Walthour and Miller—paced by two tandem teams each. The contestants started from opposite sides of the track, making it a pursuit race. In the first three miles Walthour gained 100 yards, but lost them all in the fourth mile. At the sixth mile Miller was leading by 200 yards. Walthour then made a desperate effort, jumping his pace makers and going after his opponent, who, however, in a hard sprint won out with a lead of an eighth mile in 21:37.

#### Walters Wins in Record Time.

A special cablegram announces that Walters of England won a fifty-mile race on the Parc des Princes track in Paris in the world's record time of 1:22:42 3-5 April 16, lowering the best previous time made by A. D. Frost in 1896 by 12:03. Digeon finished second and Linton third. Starbuck quit the race at twenty-five miles.

#### German Season Opened.

The racing season opened in Germany with a big Easter meet in which the scratch races were run after the American style and interested the spectators greatly. Verheyen and Buchner were the stars of the occasion, the latter winning the 2,000-meter scratch race the first day and the former the same race the second day.

#### Entry Blanks Out for Big Meets.

Announcements of early spring race meets are beginning to take the more tangible form of entry blanks actually out. The first in the field is that of the Atlantic Athletic Association for the opening of Manhattan Beach on June 17. Its main feature is the Atlantic sweepstakes at \$10 each, with \$500 for first and the entrance money divided among the second, third and fourth men in the ratio of 50, 35 and 15 per cent., respectively. The Seaside dash at a half-mile has \$185

in money divided among the first four men in the usual proportion. The opening meet of the season, for which entry blanks are also out, will be at Ambrose park on May 20. The headliner race will be the Wild West handicap at a mile, with \$200 for first, \$100 for second, \$50 for third and \$25 for fourth. The Ambrose dash at a half mile, with \$185 in money, and an invitation two-mile multi-cycle handicap with \$175 up, will give the money chasers generous rewards for their efforts.

#### Singrossi Wins in Record Time.

The 2,000-meter international scratch race run at the two-days Easter meet held in Milan, Italy, April 2 and 3 was won by Singrossi from a good field including Pontecchi, Eros and other leading Italian racing men. Connelli ran second in the final. Eros and Cisotti won the 2,000-meter tandem race.

#### Illinois Road Bill Defeated.

The Curtis hard roads bill, fathered by the Wheelmen of Illinois, was killed in the state legislature at Springfield last week. When called up for third reading it was defeated by a vote of forty yeas and sixty-three nays, the farmers having rallied against it.

#### NEWS IN BRIEF.

Edouard Taylore, the French rider, at the recent meeting of the I. C. A. in Paris paid the fine imposed by the L. A. W. to Secretary Sturmev, said he was sorry, and would not do so again.

The Walthour and Kraemer brothers, "Bob" Miller and other riders who have been racing in Texas this winter on the circuit of Jack Prince, are riding in good form and will soon come north to train with the racing men at Fountain Ferry.

Bald says that some time in June he will ride a series of match races with Arthur Zimmerman. There will probably be three races, the first being scheduled for Buffalo, the second for Asbury Park, and the third for some one of the tracks in New York.

As a result of the efforts of the Associated Cycling Clubs of Long Island, the police will from now on see to it that trolley car motor-men pay strict attention to the ordinance providing that all cars come to a full stop before crossing asphalt streets and bicycle roads.

The Associated Cycling Clubs of Greater New York decided by a unanimous vote last Wednesday night not to run a race meet at Berkeley Oval on Decoration day. Thus the L. A. W. loses its last chance to conduct races in the metropolitan district under its own auspices.

A large race meet is to be held on the new third-mile board track in Charleston, S. C., May 10, during the reunion of the United Confederate Veterans, when 40,000 to 50,000 visitors are expected to be in the city. Some of the fastest racing talent in the country will be secured for the occasion.

Frederick and Nawn have arrived in Paris from this country. The former states that while the result of his trip to America was not brilliantly successful from a financial point, he has learned much regarding continuous racing and that the 100-hour race in Roubaix next month will prove it.

After an interval of four years the Poor-man road race from Hamilton to Cincinnati is to be revived and will be run this year on Decoration day instead of July 4, as formerly. Early indications warrant the belief that it will be the most successful ever given. It is under the management of J. E. Poorman, Jr.

Chicago, Milwaukee and Racine will be formed into an N. C. A. circuit. Race meets will be given successively during the season, each city giving a meet in the same week. The prizes will be liberal and it is thought that the riders may be safely tempted from the eastern tracks at different times for a trip around this circuit.

It is the intention of Jack Prince to work north from the Texas points this spring, building coliseums in various cities and connecting all the main points from Omaha to Galveston in a chain of tracks upon which circuit meets will be held the year round. Prince has a national coliseum circuit plan in mind.

**The rush is on!**

*Mr. Dealer*—Now is the time to sell bicycles. If a sale slips past you now, it is gone forever. Nobody wants to wait at this season of the year for your manufacturer to make a bicycle before he can ship it to you.

**How are you fixed?**

Is your manufacturer able to take care of your requirements? Many of them are not, and there is going to be a panic for *good* bicycles in a very few days. Hadn't you better tie up with a responsible concern who can take care of your trade promptly? We can handle your business, and the

**“Patee Crest,” \$35.00**

is the easiest selling bicycle on earth. Built on the lines of the most consummate symmetry and perfection; magnificently finished; the easiest running machine ever straddled. Have you seen it? Read what this man says of it:

ST. AUGUSTINE, FLA., January 23, 1899.

PATEE BICYCLE CO., Peoria, Ill.:

**13,000 Miles  
on a...  
“Patee Crest”**

*Gentlemen*—Please send me catalogue of your '99 bicycles. I have ridden a “Patee Crest” since February, '98. I am a constant rider, my cyclometer showing 13,000 miles. Notwithstanding the long distance and hard usage, my machine looks as well to-day as the day I bought it, except, of course, the enamel is not so highly polished.

I certainly think the “Patee Crest” is the equal to any machine made, and I have ridden all of the standard makes. I have ridden the above number of miles through all kinds of roads and weather, and in spite of all this unusual wear the bearings are perfect and show no signs of wear. I have been to no expense on the machine and have only given it enough care to keep the bearings well oiled. I want another just like it for my wife. Awaiting your reply, I am,

Respectfully,  
R. V. PERINE, *Gen'l Agent Amer. Typewriter.*

We didn't pay a cent for that. He bought his wheel, paid cash for it, and we never knew he had it till we got this letter. We have hundreds more just like it, but not quite so many miles.

**Interested?** Write for catalogue to-day. It's the only cinch in the bicycle business to-day. Quick sales and good margins for the agent.

**PATEE BICYCLE CO., 111-113 Main St., Peoria, Ill.**

**To Buy Well is as important ..as.. To Sell Well**

## RETAIL MISCELLANY

## General Information Concerning Cycle Agents and Repairmen Throughout the Country

## Arizona.

Mesa—Abell, Wilbur & Co. have incorporated as the Abell-Wilbur-Mullen Hdw. Co.

## Colorado.

Pueblo—Geo. M. Knebel, L. J. Knebel and C. M. Bergman have incorporated as the Knebel Cycle Co.; capital stock, \$2,000.

## Connecticut.

Bridgeport—The bicycle store of Thomas R. Aston on State street has been entered by burglars, who succeeded in securing nothing but a second-hand machine.

Naugatuck—F. Alton Clark will open a bicycle store in the Hopson block with several makes of machines and a complete line of sundries.

Norwich—The Plaut-Cadden Co., which is a consolidation of the Cadden Cycle Co. and the business of the late Abraham Plaut, will be managed by Julius W. Cadden and Rutherford C. Plaut. At their handsome new store on Main street are displayed bicycles and jewelry, clocks, etc. The bicycles comprise a full line of Monarchs, the Victor and Victoria and the Rambler, Ideal, Stormer and many other makes.

## Illinois.

Beardstown—C. A. Underwood, a practical machinist who has had much experience in bicycle repairing, has opened the first exclusive repair shop that Beardstown has had. It fills a long felt want.

Chicago—An explosion in a drug store next door to the bicycle shop of W. H. Smith, Thirty-first street and Michigan avenue, shattered the building, causing him a loss of about \$1,000.

Chicago—The George W. Phalin Co. has incorporated with a capital stock of \$10,000. It will manufacture and deal in household goods and bicycles. Incorporators are Claud B. Raynor, Clyde A. Morrison and Herbert H. Howe.

Freeport—Hacket & Lichtenberger will be succeeded by the Hacket Hardware Co.

Harvey—Ranger & Hilbish have dissolved partnership.

Hoopestown—James M. Newton has taken a partner in his hardware business. The firm is now Newton & Lamon. Bicycles are handled.

Rockford—Charles Rapp will open a bicycle store in the Peterson block. He will carry a full line of bicycle parts and sundries.

Sheridan—Condon & Dondanville will open a bicycle repair shop in Dondanville's hall. They will have a new line of the best make of bicycles and bicycle sundries.

Woodstock—Alfred Annis will run a bicycle repair shop for G. S. Adams & Co.

Wm. C. Beindorf will in future conduct the machine shop formerly owned by Beindorf Brothers at Litchfield.

## Indiana.

Anderson—T. C. and Homer Stamper will open a first class repair shop on Tenth street. They are both expert mechanics.

Decatur—J. E. Ellsworth & Co. will soon open a bicycle establishment in North Second street.

Heckland—S. D. Humphrey will hereafter handle a stock of bicycles.

Indianapolis—J. D. Hoss has sold out his bicycle business.

Kokomo—Edgar Apperson has engaged Mr. Schmalholtz, a bicycle repairing expert of Indianapolis, who will do all kinds of difficult repairing at the South Main street store.

Rensselaer—A. L. Willis, the veteran gunsmith and bicycle repairer, is now able to get to his shop again after a long absence on account of a broken hip.

Terre Haute—A. Chaney, a bicycle dealer at the corner of Seventh and Walnut streets, is adding the last touches to an improvement on a fuel oil burner patented by him in August of 1892. The change is the substitution of artificial gas for crude oil. The burner is to be used for welding and bending all kinds of iron metal.

Yountsville—A. C. Yount has moved his bicycle business to Crawfordsville.

## Iowa.

Des Moines—W. J. Riddell, manager of the Des Moines Cycle Co., announced a guessing contest on the number of miles which

a bicycle, propelled by electricity, would run in a given number of hours, the winner to receive a \$40 bicycle free. No less than 11,000 guesses were recorded and they vary from 7½ miles up to 13,000.

Creston—James H. Patt, dealer in hardware, etc., will be succeeded by Geo. W. Craig.

Stanwood—The hardware store of Homer E. Hart has been damaged by fire.

Story—Holm Brothers, dealers in harness and bicycles, have dissolved partnership.

Williams—Ed Ripley has sold his bicycle business to A. W. Ross.

Fred Miller of Epworth has purchased John Eichner's bicycle repair outfit and can be found at T. O'Connor's, where he is prepared to do all kinds of work in this line.

## Kansas.

Salina—Axel Westerlund is planning to start in the bicycle business.

## Kentucky.

Bowling Green—The Kellogg Hardware Co. has been damaged by fire.

Middlesboro—Coleman Hobb has purchased W. A. Cooke's stock of bicycles and will this season run a bicycle livery. He will also employ an expert and do all kinds of repair work.

## Maine.

Winthrop—D. L. Caldwell is fitting up the Chandler store for bicycle repairing.

## Massachusetts.

Somerville—Fred B. Crowell, late of the Iver Johnson company, has opened an agency for the Hunter bicycle at 337 Somerville avenue.

## Michigan.

Bad Axe—H. P. and J. Deno of Saginaw will open a bicycle repair shop.

Bay City—Frank Graves has started a bicycle repair shop at 107 South Henry street and is now prepared to repair machines of all descriptions. Sundries will also be sold.

Beaverton—John T. Harvey has sold out his hardware business.

Grand Marais—Arthur Bryde will soon open a bicycle livery for the season's business and will have in stock a large number of standard makes of bicycles.

Leslie—Annis & Sayers have bought the bicycle interest of M. A. Osborn and the trade will be rushed.

Monroe—F. S. Andrews of Elkhart, Ind., will open a bicycle repair shop.

## Minnesota.

Monticello—Andrews, Brewster & Co. succeed M. B. Bryant in the dry goods, hardware and bicycle business.

## Mississippi.

Lumberton—J. D. Allison has opened a ladies' bicycle repair shop at the Barnes House. He makes punctured tires a specialty.

## Missouri.

Lancaster—S. W. & J. T. Mills have sold their hardware business to F. O. Birney.

Mexico—Mr. Hord has retired from the hardware firm of Hord & King. V. A. P. King will continue the business.

## New Jersey.

Atlantic Highlands—Holmes Quackenbush has resumed his old position as bicycle repairer in T. J. Emery's shops.

## New York.

Cambridge—William Shiland will open a bicycle livery and repair shop in Beach's hall.

Greenwich—Chas. Weston of Keeseville has opened a bicycle repair shop on Main street.

Livonia Station—P. B. Crain & Co. are out of business.

## North Carolina.

Graham—Holt & Wharton have gone out of business.

## North Dakota.

Fargo—Geo. D. Brown has added a new lathe and other machinery to the repair rooms of his bicycle house.

Hope—J. H. McCallon succeeds McCallon & Merriell in the hardware and bicycle business.

Grand Forks—Lyons & Co., bicycle dealers on DeMers avenue, have just added to their already well equipped bicycle store a large

assortment of sporting goods. This company carries the largest lot of bicycles in the state and does a large amount of repairing.

Inkster—Reiton & Scouton, furniture and bicycle dealers, have gone out of business.

## Ohio.

Cedarville—Chas. M. Crouse will continue the hardware business of the firm formerly known as Crouse & Bull.

Dayton—Borderwisch & Krug, bicycle dealers, have dissolved. Edward Borderwisch will continue the business.

Gallipolis—Charles Brown has reopened his bicycle repair shop.

West Alexandria—Mr. Wampler has retired from the firm of Oxer & Wampler. The business will be continued by Oxer & Flander.

Youngstown—Joe Seaburn has opened a bicycle repair shop on Church street.

L. G. Simpson succeeds Powell Brothers in the hardware business at Chesterville.

## Oklahoma Territory.

Oklahoma City—W. W. Storm & Co. have sold out their hardware and bicycle business.

## Pennsylvania.

Corry—The Brigham Hardware Co., Limited, has been succeeded by McCray Brothers.

Erie—The new bicycle store opened by Chambers & Suerkin, 22 West Ninth street, is now fully equipped and the enterprising firm is ready to handle any amount of business. The store has been refitted and the salesroom presents a neat and attractive appearance. The firm is handling the Andrae as a leader, and also the Keating and Remington models. A bicycle livery stocked with new Andrae machines is advertised and a full line of sundries is for sale; also a complete repair department has been established.

Lancaster—Isaac Diller's Sons have gone out of the hardware business. They are succeeded by Herr & Snively.

Smethport—Alex. Clarke will open a bicycle repair shop in the Backus block.

F. A. and N. M. Hendershott have moved their bicycle shop to Wyoming avenue, Kingston.

G. C. Giess' bicycle store at Seigfrieds Bridge has been robbed of \$50 worth of tools and clocks.

The Wrigley Hardware Co. succeeds Miles Wrigley in the wholesale and retail hardware business at Mahaffey.

The new bicycle store of the Williamsport Supply Co., 213 West Fourth street, Williamsport, is made attractive by a row of electric lights around the front window.

It is said that George McBath, the hardware dealer of Kylertown, will open a bicycle repair shop and will be prepared to doctor any old machine.

The hardware store of Bard, Reber & Co., Reading, has been damaged by fire.

## Texas.

Dallas—Boren & Cave, bicycle dealers, have dissolved partnership.

Waco—The vehicle establishment of J. D. Thomas has been damaged by fire.

## Utah.

Richfield—J. M. Peterson, of the firm of J. M. Peterson & Co., is dead.

## Vermont.

Burlington—H. G. Pearson is starting a repair shop at 33 Battery Place.

Milton—M. A. Coon has been fitting up rooms for a bicycle and clothing business.

## Wisconsin.

Ashland—Kuhn & Gregory, bicycle dealers, have gone out of business.

Green Bay—M. Anheuser is moving his tools, etc., from the west side and will open a gun and bicycle repair shop at his old stand in the Duchateau building, Main street.

Milton Junction—T. I. Place has engaged competent help for his bicycle department and will repair machines promptly and properly.

Mount Horeb—Alvah Webber has opened his bicycle shop in the Bokken building.

Stevens Point—The Hoeffler Mfg. Co., has just become settled in an elegant new store which occupies the entire main floor of about 400 square feet in the Atwell block. It is one of the largest and best appointed exclusive bicycle stores in the state. Orders are already booked for about 300 machines. The company wish to call attention to the fact that, buying bicycles in large quantities for cash, they are enabled to give the public closer prices than is possible in handling small lots.

Superior—Tony Lund has opened his bicycle shop at 1716 North Fifth street and is prepared to do anything in the line of cycle work. He will keep a number of machines in stock and expects to manufacture some this season.

# CYCLE AGENTS

Vol. XXII. No. 25.

THE CYCLE AGE OFFICE.

April 20, 1899.

## The Cycle Age and The Motor Vehicle Trade

### A Monthly Supplement

Commencing with its issue of May 4, and continuing with the first issue in each succeeding month The Cycle Age will publish a Monthly Supplement, containing exclusively Motor Vehicle matters.

### The Weekly Department

Every issue of The Cycle Age will, as heretofore, contain a Motor Vehicle Department in which will be chronicled the most important commercial and mechanical developments in the same line.

Motor Vehicles are today more easily managed than horses and some day in a not distant future they will also be more generally understood and more generally employed.

Some day, too, the horse on the streets of any great city will be regarded as a curiosity.

That such conditions are desirable from every standpoint is undeniable. Dirt and noise will be largely avoided and transportation will be accelerated. There is no end to the reasons which might be cited for the general adoption of Motor Vehicles. Chief among all is their great economical advantage over horse power.

On the other hand, the greatest obstacle to their general adoption lies in the public's unfamiliarity with the subject and their hesitation to shoulder the first comparatively heavy investment in an article of which they know little.

To remove this obstacle will be the main aim of the Motor Vehicle Department of The Cycle Age, as it has been in the past.

Letters received with great frequency from Cycle Age subscribers, show that CYCLE AGENTS as a class are deeply interested in the development of Motor Vehicles commercially and mechanically.

Fifty-five Thousand houses of that class, some of them, too, buyers of immense quantities of goods scattered all over the world, are readers of The Cycle Age. They will eventually become buyers.

The advantages of properly presenting the merits of complete vehicles and their parts before men of this class is obvious.

Through the Monthly Motor Vehicle Supplement it will be possible to carry out this endeavor more thoroughly than heretofore and to reach not only the merchants who read The Cycle Age, but also all others among

the broader public who are specially interested in Motor Vehicles, but for whom The Cycle Age is not intended.

So long as the public preferences are yet undecided and mechanical progress in Motor Vehicle construction is rapid, there is a large element of risk in manufacturing motor vehicles to carry in stock. Capital therefore holds back and is not invested in the industrial establishments for their manufacture, directly. Yet the industry cannot develop rapidly until it can produce ahead of orders, because orders are not given in great numbers until all who might give them have ready access—wherever they live—to inspect and try vehicles similar to that which they may desire to buy.

To break this deadlock between manufacturers and prospective consumers and set the new trade going will be another aim of The Cycle Age.

Nearly every day commercial companies are being formed to buy and sell or hire motor vehicles. Such companies, while not identified with any one Motor Vehicle manufacturer, relieve in a measure the industry from the need of immediate large capitalization, and form the indispensable link through which the public may become practically acquainted with motor vehicles before investing in them. Such companies are largely composed of

men who have had the opportunity to satisfy themselves of the future awaiting the Motor Vehicle trade. When properly conducted they will reap profits through their enterprise while also accelerating the industry and serving a useful public purpose. To promote the interests of sound and conservative auxiliaries to the Motor Vehicle Industry of this character will also be within the scope of

The Cycle Age Motor Vehicle Department and Supplement.

# INFORMATION FOR BUYERS

## TRENTON CYCLOMETERS.

The Trenton Watch Co. of Trenton, N. J., is able to turn out first-class cyclometers in large numbers at moderate prices through the facilities of its large and well equipped watch factory and the many thousand Trenton cyclometers now in use speak well for the reliability of the little recorders. Model E, which is the company's leader, is shown in the illustration herewith. It registers 10,000 miles and repeats. It weighs but one ounce. The case and dial are of aluminum.

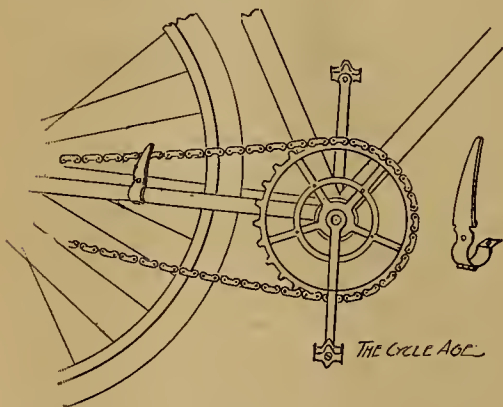

The dial which does not readily break or crack is one of the original features of Trenton cyclometers. The constantly moving hand is plainly visible to the mounted rider, who may watch his progress without difficulty. The cyclometer can be run forward or backward at a high rate of speed without danger to any of its parts. There is a system of interlocking wheels carrying the small registering dials, which prevent jumping or inaccurate registration. The company also manufactures two patterns of different size of its 1,000-mile repeating instrument.

## REMOVAL OF THE FRASSE COMPANY.

The Frasse Co., established in 1806, will move from the present address to 33 Cortlandt street, New York city. Its increase of business demands the removal in order to accommodate the large line of machinery and tools. The location will also bring the company in closer relation with the machinery trade. This house was established in 1806 by Henry F. Frasse, in 1842 carried on by William H. Frasse, and incorporated under the present name in 1892. It is headquarters for Stubs' tools, files and wire; Sterling lathes and Starret's tools and cutters.

## BORDO CHAIN GUIDE.

The accompanying illustration shows the appearance of the Bordo chain guide when attached to a bicycle. The device is simple and inexpensive and prevents a loose chain from swinging out of its correct path and catching the right crank end. The guide is also valuable in preventing chains from overriding sprockets, which occurrence often ends in broken chains and buckled sprockets. It is full nicked and the inner face

against which the chain runs is lined with leather securely attached. The clasp is made in forms to fit round, oval and D shape rear forks. The manufacturer is the Nehoiden Specialty Co., Needham, Mass.

## RUBBER NECK SADDLES STAND SERVICE.

Some doubts seem to have been entertained by competing saddle manufacturers and some dealers regarding the durability of the honeycomb rubber cushion which is a characteristic feature of all Rubber Neck saddles

made by the Bunker Saddle Co. of Chicago. It has been thought that under continued usage the walls of the cells would break down so that the saddle would lose its form and elastic qualities.

That this is a false impression is proved by the condition of many Bunker saddles that have done service for one or more seasons and been ridden thousands of miles without having lost shapeliness. A pair of Rubber Neck saddles which have been used for a season on a tandem belonging to a member of the Cycle Age staff and which have frequently met with perspiration and rain are still in good shape, literally, and perfectly serviceable for this season.

## CRANK SHAFT FOR CHAINLESS MACHINES.

The crank shaft mechanism shown in the accompanying illustration has been patented by J. H. Holak for the Aurora Automatic Machinery Company. Either one or both cranks are detachable. The first drawing shows one detachable and the other fixed with the shaft. The shaft is in this case surrounded with a cone-bearing sleeve abutting against the crank hubs at both ends. In another similar form, not shown, the cones are formed upon the shaft and the sleeve is dispensed with. The second drawing shows both cranks detachable and the shaft threaded for the reception of cones. The shaft is bored for the passage of a bolt, of which the head is formed with two taper pins of circular cross section, which fit into

tapered recesses formed partly in the surface of the tapered shaft-end and partly in the crank hub. A securing-nut which enters into a conical recess in the outer face of the fixed crank is threaded upon the free end of the bolt and serves to draw the taper pins securely into their sets, thereby also drawing the detachable crank onto the tapered shaft end. When both cranks are detachable tapered locking pins form integral parts of a washer which is slipped over the bolt before the securing-nut is applied. By the use of tapered locking pins the inventor attains a method of fastening which affords plenty of binding surface independently of the taper fit of the crank hub upon the shaft. The crank hub may therefore be pressed tightly into a definite position against the shoulder or sleeve on the shaft without danger of lost motion between the parts. The cranks are thus always at the same distance from each other when fastened, and this is deemed to be of especial value in crank shafts for chainless machines in which it is necessary that the gears be maintained in uniform relations to each other.

## STEARNS CANADIAN BRANCH TO MOVE.

E. C. Stearns & Co. have under consideration a project to remove their factory at Toronto to some other part of the dominion. The Canadian trade is supplied from the factory at Toronto and the trade has outgrown the capacity of the present plant. It is said that there is no chance to enlarge it and the firm finds it necessary to remove to some city, where larger quarters can be ob-

tained. The company has several places in view, but it will be some time before any definite decision is reached. The plan is to move in July so as to prepare for the 1900 trade. At the Toronto factory about 150 men are employed.

## IMPROVED RUSH TIRE.

W. I. Dreisbach of Williamsport, Pa., has secured patent for the improvements in construction of Rush tires which are indicated in the accompanying illustration. The locking flap which is made with fabric cut bias and is vulcanized to the tire sheath, has its

corrugations so proportioned in their diameters as to conform closely to the curvature of an ordinary crescent wheel rim when brought in interaction with the corrugations on the free edge of the tire casing, which are also correctly proportioned, and the result of this provision is that the joined edge will hug the rim closely without any tendency to warp away at any point. The patentee reserves the right to apply his construction to tires in which no inner air tube is employed, making his tire "tubeless." In such case the inner wall of the tire is to be coated with a thin film of rubber and the corrugated meeting surfaces of the locking-flaps are to be provided with sealing-layers of soft rubber.

## MAKE DEFINITE CLAIMS.

Glittering generalities will not as effectively advertise a mechanical article as they will a new brand of pills. The bicycle buyer is more anxious to know legitimate reasons for deciding than the ordinary advertiser seems to give them. R. H. Wolff & Co., New York city, are taking advantage of this laxity by constantly hammering away with distinct and positive claims for their eccentric chain adjustment, self-oiling bearings and button-hole hubs.

## THE REEVES IDEAL SEAT POST.

O. F. Reeves of Saginaw, Mich., states that he is prepared to furnish samples of his Reeves' Ideal spring seat post to the trade and can make deliveries in quantity by May 1. This post has been on the market since 1896 and is not an untried invention, as 7,000 of them are in use among riders scattered all over the globe. This year's product is constructed exactly like that of last year which is giving perfect

satisfaction and which the inventor thinks can hardly be improved.

The construction of the post is made plain by the drawing. It consists of two telescoping tubes with an inclosed compression coil spring made by one of the oldest and most reliable spring manufacturers in the United States. The ell is reversible for either forward or backward position. The tension of the spring can be regulated to varying weights by means of the screw at the top. The Reeves post can be applied to any bicycle having binder bolt or internal

expander adjustment for screwing the post with 7-8 or larger seat mast. It is made in two regular sizes—7-8 and 1 inch. Bushings are furnished for masts of other sizes.

#### THE CLARK AUTOMATIC VALVE.

The valve whose construction is shown in the accompanying drawings is exceedingly simple, has few parts, no springs to drop out and no rubber washers. It consists of but three parts—cap, body and check. The

THE CYCLE AGE

check is effective and absolutely air tight, operating by means of a cone-shaped plunger entering the end of a section of small rubber tube and expanding it against the inner side of the body. The entire check arrangement can be readily removed from the body by unscrewing, as shown at the left. It has a universal thread for pump connection and the cap is provided with the usual projection for deflating the tires. The parts of the valve are made of non-rusting metals, and it is furnished with either plain or metal base. The Clark Automatic valve is the product of the Clark Novelty Co. of Rochester, N. Y., which also manufactures the Clark rotary bicycle alarm and contracts to make metal goods of all description and special tools and light machinery.

#### ELDRIDGE AND BELVIDERE CYCLES.

The standard finish on all the different models of Eldredge bicycles made by the National Sewing Machine Co. of Belvidere, Ill., is a lustrous ebony black with rims enameled in royal purple. The ladies' little diamond frame machine is, however, regularly enameled in robin's egg blue throughout. The two patterns of Belvidere machines, which sell each at \$40, are enameled in maroon with white rims unless otherwise ordered. The leaders of the Eldredge line are a pair of 30-inch wheel machines, the list price of which is \$60 each. This concern is one of the few companies listing a ladies' machine with 30-inch wheels.

The standard men's and women's patterns of the Eldredge sell for \$55 each. In general design and constructional detail they resemble the 30-inch wheel models, the only vital difference being the change in frame lines to suit the wheel size requirements.

The Eldredge Lady Diamond is a neat little 22-inch frame machine designed to suit the fancy and answer the needs of the lady rider preferring the rational type of woman's mount. It has the same construction and flush joint frame used on the other patterns. The Eldredge racer has 1-inch tubing in the frame and carefully machined light outside joints. It was on this machine that C. W. Miller made all of his long distance records and winnings. The Eldredge tandem has a simple, staunch frame with parallel diagonal tubes and is especially adaptable for fast riding. The handsomely illustrated catalogue issued by the company gives detailed descriptions of all of the models and presents clearly the various original features of Eldredge and Belvidere construction.

#### INNER TUBE JOINTS FOR AIR TIRES.

With a view to avoiding the difficulties incidental to splicing together the ends of rubber tubes F. R. Chamberlain of Newton,

THE CYCLE AGE

Mass., has devised and patented for the Newton Rubber Works the method shown in the accompanying illustration. Each end of the tube is in the molding drawn together so that the edges form a smaller opening than the diameter of the tire and is provided with a metal coupling member consisting of a head and a screw-threaded nip-

ple. A nut is screwed upon the nipple and against the gathered-in edge of the tube end so as to clamp the edge between the flat inner surface of the head and the nut. A washer or packing ring is interposed between the nut and the rubber. A coupling ring with right and left thread is screwed upon the two nipples which are threaded to correspond. The nipples are preferably hollow to allow air communication through them. By inflation the tube ends bulge sufficiently to abut against each other closing the gap between them, which is smaller than shown in the illustration.

#### VINDEX CHAINLESS BICYCLES.

The Reading Cycle Mfg. Co. of Reading, Pa., has been quietly at work during several months past, developing the Gentry gear mechanism for chainless bicycles, and has now reached the point where it can offer these machines to the trade with every assurance that the gear is a success.

The front and rear gears are attached to the crank flange and rear hub in the same manner that sprockets are attached to a chain wheel. These gears mesh with the intermediate gear, which is comprised of two forged rings, one within the other, accurately machined; the inner ring is fastened with screws to lugs brazed on to the rear fork. The outer surface of this ring is grooved, forming a track for the balls, upon which the rear gear ring revolves, the latter being similarly grooved on its inner periphery. These gears are all machined as light as is consistent with strength, so that

there is not an ounce of metal more than is necessary to insure safety. The total weight of the bicycle with complete equipment is 27 pounds.

One of the principal points about the Vindex chainless bicycle is the ease enclosing the gears. This case is dust and water proof, all of the openings being protected by felt washers, making it impossible for the weather to affect in the slightest degree the running qualities of the machine.

In adapting the Gentry gear to the Vindex bicycles, provision has been made for the perfect interchangeability of the chainless model to the regular light roadster chain

machine. If for any reason the rider wishes to change his mount to a chain model, he has only to remove the gear and case, substituting Vindex light roadster front and rear sprockets. Provision has also been made for the simple adjustment of the gears so that they can be brought into closer contact with one another if necessary.

#### BRASS LINED TUBING.

The Wilmot & Hobbs Mfg. Co., makers of Clincher tubing, have issued the following letter to bicycle jobbers:

"You undoubtedly have noticed the numerous articles in the trade journals and daily papers of recent issue relative to the new process of brass lined bicycle tubes. This is the process of The Wilmot & Hobbs Mfg. Co., and consists of the application of molten brass to the interior of tubes, either seamless or Clincher, thoroughly uniting with the interior surface of the steel in a layer of brass less than one-half a thousandth of an inch thick, thus causing no material difference in weight.

"The advantages of this process you will readily appreciate, for it not only insures a perfectly brazed connection, but it entirely prevents the interior rust of tubes, which is almost invariably the cause of frame breakages; and it also prevents sympathetic rust from forming on the exterior of the tubes, under the enamel, which, as you know, causes the enamel to peel or chip off.

"In fact, the merits of brass lined tubes are so apparent that we feel sure you will fully appreciate them, the matter having

been brought to your attention; and as we have brass lined hundreds of thousands of tubes for prominent manufacturers this past year, we have no doubt but that many of the factories from whom you purchase wheels are already furnishing you with this brass lining throughout the tubes of their frames. We would suggest your corresponding with them to ascertain just which ones are using the process, for where you already have bicycles with brass lined tubes you should not overlook the advantages you can obtain in pointing out the feature to your customers in disposing of your goods.

"We will send you on request a sample of this brass lined tubing for your inspection, and if you would like any further information on the subject we will be pleased to have you write us or see our Chicago representatives, Fred. W. Colson & Co., Manhattan building, or George Damarel, room 807 Postal Telegraph building, New York."

#### CARRIER TO FIT ANY FRAME.

The new package carrier of the Aetna Mfg. Co., 225 Dearborn street, Chicago, is designed to attach to rear stays of any shape as shown in the advertisement on another page of this issue. It is provided with clips at the top which are adjustable with the entire frame to any desired width apart, for attachment to either straight or cranked stays.

#### PATENT ALLOWED ON KELLY BAR.

Letters patent were recently granted to W. E. Kelly of the Kelly Handle Bar Co. of Cleveland, O., and assignor of one-half to Katherine J. Weed, of the same place, on the construction herewith illustrated. The principles of construction and operation are already well known through the advertising and sale of the Kelly bar for the past year. The claim covers "the combination of a bar stem provided with eyes spread outward at a slight angle and hav-

THE CYCLE AGE

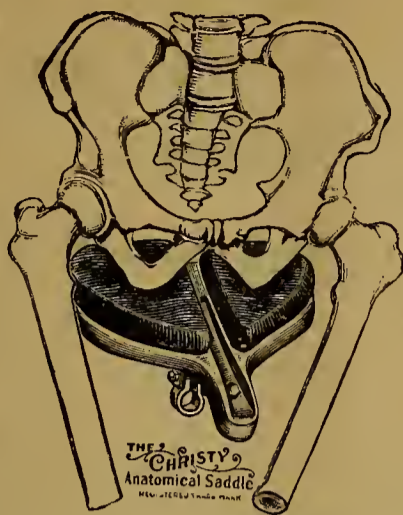

ing a segmental row of radial corrugations on their inside faces, handle bars having offset eyes provided with a continuous circle of radial corrugations on their outer faces, and a bolt and nut through said eyes for springing the stem eyes onto the bar eyes and clamping them together." The inventor states, however, that the bar adjustment may be locked by means of a small cam lever in place of the nut on the clamping bolt, which makes it possible to change the angles of the grips more quickly.

#### CANADIAN SUNDRIES CATALOGUE.

The Yarmouth Cycle Co. of Yarmouth, Nova Scotia, is supplying both the wholesale and the retail trade in its territory with sundries and cycle supplies of various standard makes. A plain, neat catalogue illustrating and describing the well assorted line of goods handled has been recently issued by the company. The majority of the articles listed are of United States manufacture. The company is also agent for the Massey-Harris, Stearns, Cleveland, Rambler and several cheaper lines of bicycles. The sale of these machines is carried on locally in a well equipped cyclery which includes repair and renting departments and facilities for handling all sorts of nickeling and enameling work.

#### LOZIER'S CANADIAN FACTORY.

The Toronto Daily World of March 25 devotes two columns to a detailed description, with illustrations, of the Canadian factory of H. A. Lozier & Co. at Toronto Junction, Ont. Methods of manufacture and the distinctive features of Cleveland bicycles are given especial attention and the enterprise of the Lozier company is brought vividly before the reader. The Canadian factory was established in 1898 and in it Cleveland bicycles are produced for the trade in that

## DIFFERENCE IN SADDLES

Leather saddles can be bought at from 50 cents to \$1.00. That's why some makers equip their wheels with them. Christy Saddles cannot be bought at that price. The selling price is \$2.00 no more and no less—and they are worth it. Insist that your wheel be fitted with the Christy Saddle. No dealer will lose a sale on account of your preference.

The Christy Saddle has received the endorsement of 5,000 physicians.....

**REWARD FOR STOLEN CYCLE.**

John Gillen, sheriff, Ann Arbor, Mich., is advertising \$5 reward for the recovery of a Record bicycle made by the Butler Co. of Butler, Ind., and \$10 for the arrest or information leading to the arrest and conviction of the thief. The machine has a 22-inch frame, is enameled green, fitted with 1 1/2-inch Palmer track tires, ramshorn handle bars, B. & W. saddle, Record pedals and nicked Stahl chain. The front forks are nicked on crown and tip and the wheels have yellow sunbeam spokes. Number of machine is 12,480, to be found on under side of crank bracket.

The Milwaukee Mfg. Co. writes that it has already shipped, this season, nearly 15,000 machines.

The John Lonn & Sons Co. of LaPorte, Ind., recently made a shipment to Paris, France, of a number of bicycles. They were the regular Crown models and good results are expected from the consignment.

A four-story addition is being built to the works of the Joseph Dixon Crucible Company, Jersey City, N. J. The building will be used for the manufacture of pencils. The company expects to build a very large addition to its crucible plant during the summer.

NEW SERIES No. 74.

## REPAIRMEN ARE VERY SCARCE

**Quaker City Trade Brisk—Factory Tandems in Strong Demand—Large Wheels Are Very Popular.**

Philadelphia, April 24.—Never since the advent of the pneumatic tire, when so many solid and cushion-tired bicycles were made over, have the repairmen of this city been so busy as during the past six weeks. Good bicycle mechanics are at a premium, and even the poorest of them can command \$2.50 a day for their services. And even this inducement falls in some cases to attract the men. The fact of the matter is that all branches of the machinists' trade are well supplied with orders, and good workmen with a prospect ahead of ultimate work at a fair remuneration cannot see the wisdom of leaving their jobs for others which, although they pay better, cannot be guaranteed to last throughout the summer. Many of the local repairmen are away behind in their work; some of them, in an effort to catch up, are working overtime.

### Strong Retail Business.

The pleasant spring weather has given an added impetus to the already brisk sale of new bicycles, and many of the denizens of "the row," as a result of liberal advertising expenditures, have found it necessary to keep their places open three or four evenings a week till 10 o'clock. While the bulk of the new business, naturally, is in chain models, all those concerns handling chainless models report many sales. One local concern which does not handle a chainless warns the public against investing \$75 in a "coffee mill" when for \$41.50 their wheel, fitted with the Morse chain ("an adaptation of which George Westinghouse—having discontinued the use of bevel gears—is now using on his trolley motors"), may be purchased.

### Tandems Find Ready Sale.

The market for tandems was never better. The local manufacturers claim to have no difficulty in disposing of all the standard double-seated models they turn out. In this connection it should be stated that the repairmen, who not so many moons ago had an apparent monopoly of the tandem business, are "not in it" with the larger manufacturers, whose up-to-date models, light and cheap, seem to fill the requirements much better than the heavier patterns of a year or two ago, when nothing short of a made-to-measure machine would satisfy the demands of the tandemites. Combination tandems are a drug on the market, owing to the advent of the divided skirt, and that edict of Dame Fashion which demands that the lady occupy the rear seat.

### Thirty-Two Inch Wheels.

While the majority of local manufacturers and dealers are a unit in declaring that 30-inch wheels are a "delusion and a snare," and exhibit their sales books as

evidence that there is absolutely no demand for bicycles so equipped, one company, which goes to extremes by turning out bicycles with 30-inch front and 32-inch rear wheels, is out with an announcement that they will "discontinue making 28-inch bicycles as soon as their present stock of the material is used up." This concern claims that history will repeat itself in a year or two, when all up-to-date bicycles will be equipped with large wheels. They at present turn out five combinations of wheels—32 and 30, 30 and 30, 30 and 28, 28 and 28, 28 and 26—and the majority of bicycles with large wheels seen on the streets here are of their manufacture.

### Enticing Bargain Seekers.

As was to have been expected after last week's exposure, the American Flyer Co. has discontinued the sale of Spaldings at \$13.50. A similar firm farther up the street, however, is selling Spaldings at \$12.50. These machines are, or are claimed to be, made by the Spaulding Machine Screw Co., of Buffalo, but many people will buy these machines thinking that they are of Spalding manufacture. The American Flyer advertisements last week read: "All leading wheels at one-fourth regular prices." They have changed their tune considerably this week, the announcements reading: "Every leading make of bicycle at one-half regular prices." But they're doing a rushing business, thanks to the American love for anything resembling a bargain.

### The Usual Story.

Milwaukee, April 24.—During the week bright weather induced buyers to turn out in numbers. The result is that those dealers who have been holding back their factory orders are kicking because they cannot obtain goods. A little more confidence would have put several hundred dollars in their pockets. It is the threatened loss of trade that is causing the trouble. The men who were sufficiently long-headed to stock up early are the ones who are prospering.

## COLEMAN'S OPTION WITHDRAWN

**It is Emphatically Stated That Despite Secessions the Scheme of Consolidation Will Succeed.**

Firms which have given options upon their plants to the eastern financiers who are endeavoring to consolidate the manufacturers engaged in the bicycle business took alarm toward the close of last week when it became known that R. L. Coleman had withdrawn his option, having refused to extend it longer than April 8. The option on the Western Wheel Works plant extended only from March 9 to April 8, all other options running to June 1.

### Spalding Asks for an Extension.

The following letter was sent by Mr. Spalding to Mr. Coleman:

In looking over the various options I have received from the different manufacturers, I find that they all terminate on the same date—June 1, 1899—except yours, which terminates thirty days from March 9, which would make it April 8. That we may have uniformity in all these options, may I attach to your proposition a statement to the effect that the termination of the same is extended to June 1, 1899? A few of the first options we received, including that of Ames & Frost, terminated on May 1, but, since they have all been extended to June 1, I would like very much to have yours conform with the others. The appraisers and accountants are now on the road and they promise to have their work completed in a very short time.

New York, April 24.

A. G. SPALDING.

### Coleman Declines.

To this letter Mr. Coleman made reply as follows:

We will not renew the option which we gave you on March 9 which expired April 8. I have today written to the auditor, Mr. Simpson, requesting him to return to me all papers and memoranda which were delivered to him as auditor of the supposed syndicate.

New York.

R. L. COLEMAN.

For four or five days after this correspondence had become known to a great many people in the trade it was found impossible to get Mr. Spalding to make a statement which would definitely set at rest the rumors which immediately became rife to the effect that the project for consolidating the industry was at an end. Eventually, however, he made the following declaration:

### Cash Will be Paid, Says Spalding.

The motive for the publication of the clipping which I enclose you from the New York Tribune of April 23 is known. The source of information is apparent and the action has been discounted by me. I have more than 80 signed options, including all the principal parts makers, and they all run to June 1 or longer. When I received Mr. Coleman's option I had his positive word that the time would be extended to June 1. The project is too far advanced to be affected by his action. The options were all obtained on a cash basis, and will be dealt with to the finish on that basis, inspired newspaper reports to the contrary notwithstanding.

New York, April 24.

A. G. SPALDING.

A copy of the above letter has been

mailed to all the manufacturers interested in the proposed consolidation.

#### What the Tribune Said.

The publication in the New York Tribune was as follows:

Several bicycle manufacturers seen yesterday said they were convinced that the proposed bicycle trust, with its capital of \$30,000,000, was a thing of the past, and that the scheme could not now be carried out.

It was said yesterday that one of the makers had learned that the original proposal to pay cash for the plants would not be lived up to, and that in consequence, when he was asked to continue the option further, he absolutely refused, and some people, after reading the correspondence, might think refused rather curtly. The proposed trust did not include the tire and automobile end of the industry. When the scheme was first suggested it was said that the syndicate was prepared to pay cash for the plants. Subsequently those who managed the arrangements decided to pay for the plants with stock in the trust, it was said. This did not meet the indorsement of at least some of the makers, and that is the reason given for the bursting of the proposed trust.

R. Lindsay Coleman and A. Featherstone have been in the city for several days, and it is said that they have been in consultation frequently regarding the proposed trust. The time originally asked by the representatives of the syndicate for an option was from March 9 to April 8. It was said last night that if the Coleman and Featherstone interests had decided not to enter the trust its consummation would be an impossibility.

#### English Makers Are Worried.

In England they are narrowly watching the progress of events in this country. This view of the situation is taken by the Cycle Trauer:

The information to hand on the proposed combination of American cycle manufacturers is so meagre, and the views of the Americans are given in so guarded a fashion, that it is impossible to estimate properly the precise effect of the movement on the English trade and on the cycle trade of the world. One thing is certain, it would be madness to pretend that this critical situation in the American trade has not also for us a vital interest. Anything that tends to bring about a radical change in the basis of the American trade is worthy of our keenest attention, for, after all, the "American invasion," once so much talked of, was no visionary affair. It was an actuality, and though our own troubles have for the time allowed it to take a less prominent place in our minds, it is with us now, and there is but little indication of its departure.

#### Crippled Exporters.

Our manufacturers who strive after an export trade are even more affected by the competition of Yankee-built machines than are the manufacturers catering solely for the home market. Our interest, then, in the doings of Cousin Jonathan being of such an essential nature, it is natural that the sensation should resolve itself into the question: Will the combination affect the present selling prices of American machines?

#### Looking for a Rise in Prices.

If the trust becomes a reality, we imagine the effect will be chiefly felt in the States, for immediately a rise in prices will take place. It is certain that the formation of the trust will be abandoned if there is not an indication that when once formed it will absolutely control the trade. For a trust controlling only a part of the trade would be useless for the purpose for which it had been promulgated; outside firms would find no difficulty in obtaining materials and labor, and they would be able to place machines on the market at prices which would at once make it imperative for the trust to lower its prices and so defeat its own ends. The effect, then, on the home market would be a rise in prices, with, perhaps, a proportional improvement in quality. But we think the effect on the foreign market would be less noticeable. The bigger profits American manufacturers would gain on their home trade would enable them to carry on the foreign trade on practically the present basis, and yet without the suicidal tendencies which previously had characterized their business methods.

#### The Home Market is Safe.

In other words, we do not think the English makers who do a foreign trade are to look for a very radical change in the conditions of American competition they have had to fight against, while for the English market one effect, at least, will be that English buyers, with their rooted hatred of all industrial trusts, will have yet another prejudice against American-built machines.

## ENGLISH MACHINES HUNG UP DAYS OF HIGH PRICES GONE

### Britons Undersold by Americans in Australia, Where Good Machines Are Demanded at \$100.

Sydney, March 25.—The demand in Australia is for a medium priced bicycle. Australians will not now pay the exorbitant prices that were charged by agents a short time ago. All the cycle firms, both large and small, have recognized this fact and are catering to the demands of the public. Very little business is done with any machine that is listed at more than \$110. Australians think that \$110 is a fair amount to pay for any bicycle and still leave a fair margin of profit for the cycle agent. Two or three years ago bicycles like the Rover, the Raleigh and the Humber were sold at \$130 and \$140 almost as soon as they were landed, but times have changed since then, and these three makes are almost at a standstill now compared with the sales of the moderate priced models, yet they are still listed at the same price. The only machines that are moving at all are listed at from \$66 to \$110. A good machine will always fetch \$100 in Australia. The agents for the best English makes claim, however, that they cannot sell under the exorbitant prices charged by them. This question naturally arises: "If the American highest grade chain wheel can be sold at a good profit for \$100 and less, why cannot the English?" If it is as the agents claim, that it costs them such a considerable sum to land the English machines in Australia, then the English manufacturers of the Humber, Rover, Raleigh, Osmond and other such makes evidently believe in keeping huge profits to themselves.

#### Big Melbourne Firm Retires.

Messrs. Sutton & Company, one of the largest cycle firms in Melbourne, is retiring from the cycle trade. The firm has sold a great number of bicycles during the few years it has been in the cycle trade. It is one of the wealthiest concerns in Victoria, but made its money principally out of the sale of pianos, to which line it intends to stick in the future. When the firm announced its intention of retiring from the cycle trade, genuine surprise was evinced by the many Victorian agents. The company is holding auction sales to clear its stock. It has already held two sales. The first was only fairly successful, the machines averaging about \$40, and the second sale was less successful than its predecessor.

The Austral Cycle Agency is still alive. It is holding auctions almost every week in Melbourne. The manager of the Sydney depot expects to receive word at any moment from the head office in Melbourne to close the local branch here, where trade is at a standstill with the firm, while it is almost as bad in Melbourne.

#### American Machines More Pleasing.

Whether it is that American manufacturers have taken the hint from the Cycle Age or not, the fact remains that some of the American machines now landed in Australia are fitted with more attractive handle bars than formerly, and are also made more attractive otherwise.

It is announced that it is the intention of a large Canadian cycle firm to shortly open in a big way throughout the Australian colonies. American machines will be handled by the newcomers, who promise to stir things up upon their arrival.

F. A. Peters, of 117 Clarence street, Sydney, has purchased the entire stock and business of F. W. France & Company and is disposing of the stock taken over

at exceptionally low prices. Some American machines are being sold at prices ranging from \$38.40 to \$50.40, while a few tandems of American manufacture are listed at \$48. They are up-to-date machines fitted with the tires which are most in demand in Australia.

#### Constitutes a Light Roadster.

The following is a specification of what is called a light roadster machine in Australia:

	Lbs.	Ozs.
Frame, 24 inches .....	6	..
Front forks .....	1	15
Tires, 1 $\frac{1}{2}$ x28 inches .....	3	13
Rims .....	3	2
Saddle .....	1	7
Chain .....	1	1
Gear case, leather .....	15	8
Mud guards and stays .....	1	8
Seat pillar, plain .....	1	3
Handle bar, fixed .....	1	3
Foot rests .....	1	3
Brake, complete .....	1	2
Gear wheels, 9 and 22 teeth .....	1	3
Crank and cotters .....	1	4
Balls and lubricators .....	1	2
Chain adjustments, nuts, step, lamp bracket, etc. ....	5	
Spokes and nipples, per set .....	10	
Hubs, complete, per pair .....	1	4
Head, lug and bolt .....	1	4
Crank axle, cones and cups .....	10	
Rat-trap pedals .....	1	3
Total weight .....	29	10

#### "Traveling Agent" Working Ohio.

A man giving his name as S. M. Goldie is going through Ohio claiming to be traveling agent for twenty-five bicycle companies and to have authority to sell their machines at very close to half the price charged by local dealers. He recently spent a week in Marion, where he sold a number of machines of various makes on the basis of \$1 cash down and one-half of the balance in two months and the other half in four months. He was careful, however, it is reported, to collect the first payment of \$1 "as a guarantee of good faith," promising to make deliveries as soon as the machines could be shipped from the factories. A lawyer of the town was made his agent and was to get a commission for making the collections.

Suddenly the traveling agent left town, jumping his hotel bill, it is said, and taking with him many good dollars from purchasers of his bicycles, several of whom call every day on the local lawyer asking when their machines will arrive, only to be told that they were swindled.

The "traveling agent" is a fine looking young fellow, who approaches his victims, gives them a short talk and then introduces himself.

#### To Suppress Cycle Thievery.

The judiciary committee of the Connecticut legislature has reported a substitute bill regarding dealers in second-hand bicycles. The bill provides that selectmen may license such dealers, who shall keep books which shall contain details of purchase, open to inspection. Each dealer is to make sworn weekly returns to chief of police, under a penalty of \$100. Purchasers of second-hand bicycles must not buy of a minor under a penalty of \$100. Any dealer removing a name plate or number from a bicycle within thirty days shall be fined \$100 or imprisoned six months, or both. All persons purchasing second hand bicycles shall keep a record thereof, open to inspection.

#### New Tire Company Expanding.

The Goodyear Rubber Tire Company, which began manufacturing operations in Akron, O., six months ago, has increased its capital stock from \$100,000 to \$200,000 and will build several large additions to its plant.

Budapest, Hungary, imposes a yearly tax of \$2 upon cyclists.

**TRADE OPENS WELL IN IOWA****PURCHASERS BUYING FOR CASH****Traveling Salesmen Act the Role of Local Demonstrators—Repair Shop Made An Attraction.**

Des Moines, April 24.—Bicycle business is exceedingly good here now, on account of weather having been excellent for riding during the past ten days. There will doubtless be 3,000 new machines sold in Des Moines this season. Dealers generally are having much difficulty in getting their stock from the factories, which are in many instances behind in their orders. A few of the larger dealers have had bicycle openings, which have been well attended by prospective purchasers. These openings have resulted in few sales at the time, but in some instances the people have come back and had their selected mounts laid aside for them.

**Salesmen as Demonstrators.**

Some of the manufacturers are sending their traveling salesmen to different cities and towns in this vicinity where their machines are represented, giving one or two days' show. Each salesman is carrying a full line of models and parts and advises the agent a week ahead of the days when the opening is to take place in his store. This creates considerable interest and small crowds of people visit these openings, which have proved very beneficial for the sale of machines. In the largest cities of this state some manufacturers are having their salesmen remain with their agents a week or ten days.

**Visitors Attracted by Repair Work.**

The Des Moines Cycle Company had its opening last week and thousands of people attended. They were shown through the repair department and the making of cones and repairing of different parts of bicycles was explained, as well as how vulcanizing, brazing, enameling and repairing different kinds of tires was done. This proved to be very interesting, as was shown by the large crowds that witnessed the work. The machinery was kept running in the repair department while the workmen showed the different methods of bicycle repairing.

**Large Sales Anticipated.**

A greater number of people are paying cash for their mounts than in years previous, because of the reduction of list prices, and also because agents are making a concession for spot cash. The indications are that the sale of bicycles will be larger in this city and state this year than ever before. The sale of sundries is large and people are purchasing more gas lamps by fifty per cent than heretofore. New things are in demand in the way of specialties and are sought for by purchasers, who always want the best in the market.

Cameras are being handled by more stores than formerly, dealers finding them a very convenient side line.

**DEALERS SHOW WEAKNESS****The Policy of Selling Second-Hand Machines for Customers is Not Meeting With Success.**

Buffalo, April 24.—The plan recently put in operation by several of the more reputable stores to take second-hand machines from customers, place them on sale and either remit the amount realized to the customer or credit the same to his account, is not meeting with favor at the hands of the public, and it is feared that the policy will have to be abandoned, for the time being, at least.

"If all of the dealers would adopt the plan and religiously adhere to it," said a

dealer prominent in the movement, "there is no question but that it would eventually prove successful, but many of them are so averse to the chance of losing a sale that they will yield at the very first opportunity to the arguments of prospective buyers and give in.

"The same is true with respect to the schedule of prices to be allowed on old machines taken as part payment for new ones. The prices set on last year's makes are so extremely low that buyers do not take kindly to them, and much argument and looking around follows, with the result, usually, that the dealer gives in to the prospective buyer, and those who as a matter of principle desire to see so worthy a cause succeed, are sufferers through the loss of business which, under different conditions, would come to them."

**DELAYED FOR MATERIAL****Parts Makers Have Trouble Getting Steel—Good Workmen Are All Employed.**

Cleveland, April 24.—Retailers say that last week was the best in the history of the business in this city. All the riding public seemed to want machines at once and the stores have been constantly crowded, with the result that stocks have been cleaned out, and hardly an establishment in town is in position to deliver at once. Several concerns are far behind on orders and are losing sales daily because after a long, cold spring the riders decline to be kept waiting and go elsewhere if they can not get bicycles right out of stock.

The manufacturers are now working double time in an attempt to keep up with orders. Many concerns in this section report serious difficulty in securing certain lines of material caused by the inability of the material makers to get special raw material. According to a prominent parts maker of this city, the difficulty of getting steel may cause a shortage of bicycles later on. The ball makers and the stampings manufacturers have the same complaint to make. One local concern has a specialty which it has been preparing for some weeks to place on the market. The article is completed and would be ready to ship, except that the makers can not secure the special steel required to make a certain part. The manager of this concern, after spending several weeks in useless writing and telegraphing, is at present in Pittsburg trying to secure what he requires to finish his goods.

The shortage of material is not the only hindrance with which local manufacturers are obliged to contend, as there is a decided scarcity of skilled workmen. This is being felt throughout this section in all lines of manufacturing industry. The manager of a prominent bicycle factory located in a neighboring small city stated the other day that it was only with the greatest difficulty he could keep his factory up to the desired output because of the inability to hire good workmen. He remarked that at this time of year a factory located in a small town is at a decided disadvantage, because the good workmen go to the larger cities and find employment. He stated that he would willingly give a considerable bonus to anyone who would locate a bicycle factory in his city, as it would have a tendency to bring more laboring men and make the factory less liable to embarrassment for this reason.

**Queen City Cycle Co. Dissolves.**

The Queen City Cycle Company, of Buffalo, which has been in the hands of H. Weil as receiver for two months, has been dissolved by order of the court, confirming the referee's report.

**M. & W. ARE SUED FOR SLANDER****"BOB" ABBOTT THE PLAINTIFF****The Southern Bicycle Dealer Says a Lawyer for the Tire House Defamed His Character.**

New Orleans, April 19.—Suit was filed yesterday by Robert W. Abbott, president of the Abbott Cycle Company, of this city, against Ambrose A. Worseley, of Chicago, and Morgan & Wright, for \$5,000 damages, for slander and defamation of character. Mr. Abbott is one of the best known and most highly respected merchants in the city, as well as a man whose integrity and honesty have never been questioned.

**Origin of the Trouble.**

Some time ago the Abbott Cycle Company stockholders held a meeting, at which it was decided that because of the fact that the business was not paying well the firm should go into dissolution. Immediately Mr. Abbott and others applied to have themselves made receivers of the company to liquidate its affairs and were duly appointed, subsequently taking charge of the effects of said company and administering same under orders of the court under sufficient bond.

**What the Petition Alleges.**

The petition alleges that on or about the 5th of April Worseley, alleging himself to be an attorney at law licensed to practice by the courts of Illinois, and also representing himself to be the delegated representative of Morgan & Wright of Chicago, went to various persons in this city and stated to them that Abbott was acting dishonestly; that he was taking the assets of said company and placing them beyond the reach of the creditors, and handling the business of the firm in such a manner as would result in loss to the creditors, and was actually committing acts of dishonesty, and said statements were made by said Worseley willfully, maliciously, and with intent to damage and ruin the character and reputation of the petitioner.

**Wanted to Seize Goods.**

Worseley took out a rule on Thursday last to have the Abbott Cycle Company show cause why Morgan & Wright's goods, which are held by the Abbott Cycle Company, or were before the dissolution of the firm was begun, on consignment, should not be turned over to M. & W. As Mr. Abbott was under a heavy bond, he refused to turn over the goods without due process of law. The law requires that the defendant in an application for a rule such as that applied for shall have one week's notice; despite this fact Worseley went into court the day after making the application, and tried to force the matter to trial. Judge King, before whom it was heard, of course refused this, and stated that it would come up for a hearing later.

The goods are now in the keeping of a sheriff.

**Heavy Business for Buffalo.**

Buffalo, April 24.—The genuine spring weather of the past week made its presence felt in the cycle stores in the increased business that has followed. The volume of business transacted up to date eclipses by a large margin that done during the same period last year. One store claims to have sold close to one hundred bicycles in one day. The number covers three grades, viz., \$50, \$25 and \$18, the \$25 predominating.

A large order has been received by an American manufacturer for bicycles to be used by the postoffice employes of Japan.

# CRESCENT FACILITY

To say that Crescents are the best bicycles ever made proves nothing to those who want evidence and not phraseology.

We submit a point in evidence. The Crescent plant is the largest factory in the world devoted exclusively to the making of bicycles. We are able to complete 1,000 machines each working day. The acres of machinery can turn out 325,000 parts daily. Nothing but actual sales of Crescent

Bicycles could keep busy a plant of this magnitude, and no less a factory could supply the demand for these well known wheels. These facts prove that Crescent Bicycles are the best.

Easy Riding

COPYRIGHT 1898 BY MILWAUKEE PATENT PUNCTURE PROOF TIRE CO.

PRESENTING TESTIMONIALS.

JOHN VAN ROO,  
Architect and Superintendent.

MILWAUKEE, WIS., December 10, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen: Replying to your favor of the 9th inst., will say that last April I purchased a pair of your Patent Puncture-Proof Tires and have ridden them about 3,000 miles to date. My experience with the tires has been most satisfactory. They are, in my opinion, the best tire on the market to-day for every day service.

(Signed)

JOHN VAN ROO.

GEORGE C. EHLERS,  
Architect.

MILWAUKEE, WIS., December 1, 1898.

MILWAUKEE PATENT PUNCTURE-PROOF TIRE Co., Milwaukee, Wis.  
Gentlemen: I rode your tires the entire past season, and must say that they gave me perfect satisfaction. They are as good to-day as the day they were put on, and will undoubtedly do me for several more seasons.

Yours truly, (Signed) GEO. C. EHLERS.

Representatives Wanted. Write for prices and other information.

**MILWAUKEE PATENT PUNCTURE-PROOF TIRE CO., MILWAUKEE, WIS., U. S. A.**

# THE CYCLE AGE

ENTERED AT THE CHICAGO POSTOFFICE AS SECOND-CLASS MATTER.

Published every Thursday at 324 Dearborn Street, Chicago.  
Eastern Offices, American Tract Building, New York City.

Subscription price in the United States, Canada and Mexico, \$2.00 per year; in foreign countries \$6.00 per year.

ALL remittances should be made to THE CYCLE AGE COMPANY.

## COMPLETE BICYCLES FOR TEN DOLLARS

Though lacking proof, it has long been suspected that there was engaged in the traffic of bicycles a class of brokers who paid little heed to the safety of life and limb of riders so long as they were enabled to handle machines which could be sold at very low prices. One of this gentry, rasher than the rest, recently earned a well merited rebuke at the hands of a manufacturer to whom he submitted the following proposition:

Will you be in position to make for us during the coming year 15,000 complete bicycles, delivered f. o. b. New York, at \$10 each. We have received an inquiry regarding the above, and as they are a very large concern and in position to take as many more, I would like to have you give us your ideas regarding it. My customers do not care what material or stock these wheels consist of, or how they are put together, as long as they are in complete form, parts, tires, fittings, etc., resembling a wheel. They will also advance a certain amount of money to manufacture same and will pay for the goods, draft against bill of lading when same are delivered.

Smarting under the insinuation that they were willing to engage in any form of perilous manufacture so long as there was money to be made out of it, the maker addressed made the following reply:

We have your letter of recent date and in reply would say, that we are surprised that a house of your kind composed of men who have been in the bicycle business for such a long time as you have, both as manufacturers and merchants, should ask any bicycle manufacturer to build complete bicycles for \$10 each, when you know that if you were to make the bicycle out of junk, use hose-pipe for tires, and furnish a chromo to give it the resemblance of a bicycle, it could not be made for any such price as you name. You further state that "your customers do not care what material or stock these wheels consist of, or how they are put together as long as they are in complete form, parts, tires, fittings, etc., to resemble a wheel."

Any concern manufacturing and selling wheels of that kind would be a detriment to the bicycle business. It seems that you do not care whether men, women or children break their necks or not, as long as you make a few dollars by the transaction. An act of this kind is a criminal offense and any person responsible for it ought to be punished to the full extent of the law.

If a letter of this kind ever comes to this concern again, we shall most assuredly have a cut made of it and publish it in the cycle papers.

Apart from the fact that it would be altogether impossible to make machines at the price named in the first of the foregoing communications, it is evident that there are some people who believe there is no moral obligation connected with the manufacture of bicycles. It will need but a few more instances of this kind—possibly the execution of such an order—to warrant legislatures in passing laws which will amply protect the public against knavery in manufacture. Signs are not wanting that such measures are already in contemplation in the eastern states.

## ADS THAT TALK TO THE READER

During the course of a season agents expend upwards of a million dollars in advertising bicycles. So vast an outlay should at least show a high average in skilled work. But it doesn't. And it is likely that the general tone of retail cycle advertising will remain low until there is brought to the work of its preparation a knowledge of the value of style, which is the very essence of modern publicity.

Distinctive and original advertising was never in so great vogue as now. Obviously, nothing is more original or distinct than one's natural way of talking about his goods, and if he can succeed in impressing those very qualities into his advertising, in the correct and logical way, he has found a source of profitable publicity. The vehicle for the expression of such

thought is the conversational advertisement, of which an excellent example appeared in a recent issue of the Cycle Age.

This style, which "talks to the reader," was originated some years ago by a man who was employed to write the advertisements for Wanamaker's great bazaar in Philadelphia. What is now popularly called the "Wanamaker style" has since been largely adopted by merchants, big and little, all over the world. Many of the examples in current use are brilliant and fetching to a degree; and the advent of this style certainly marked a distinct advance over the entirely formal presentations in vogue before its coming. But it needs to be used with exceeding great skill, else it can easily descend into offensive familiarity, slang and vulgarity. "I have seen," says an observer, "advertisements which slapped the reader on the back, put its feet on his table, and spat upon his carpet. I have read others which assumed that the reader needed to be taught his A B C's—patronizing, school-teachery, you're-an-ignorant-ignoramus in its tone." To a person of any sensitiveness, these methods conspire to their own defeat. Rather the plain business card in the advertising space, with a negative and pointless message, than a style that holds offense.

The conversational advertisement seems as though it could be reeled off by the yard as rapidly as a stenographer could take it down; but woe to the tradesman who acts on such a belief. As a matter of fact, this "easy" style is probably the most difficult to write with a view to results, involving as it does the finest study of human nature and the most careful consideration of the springs underlying action. The conversational advertisement should be as nearly as possible a repetition of the actual speech of a tradesman, such as he would be likely to utter to the average citizen in his salesroom. The only actual difference should be in the choice of words and the polish of diction, for the reason that when conversation hardens into printed words it is to be expected that slips in speech, ill-formed sentences and faulty grammatical construction will be absent.

## EXTENDING CREDIT TO AGENTS

The restriction of credit giving from makers to dealers has carried its force into the operations of the latter, and served to compel a closer and keener supervision of their own accounts than would have generally resulted from continued laxity exhibited toward them by the manufacturers. As a body of business men the dealers would not back up their ten, thirty or sixty-day obligations with their reputations and resources, and then dissipate their own assets along a road several months in length. As a result, they have been compelled, perhaps sometimes unwillingly, to adapt the revised policy of the makers to their own necessities and conditions, and introduce and enforce it with their customers. Following this has been a betterment which few of agents will debate, or would wish to recoll.

But the credit problem is not entirely solved with the mere shortening of the periods for which credits are extended. It would be useless to deny that the limited opportunities agents have had for obtaining credit of late have bothered them now and then in securing enough stocks to prepare for expanding trade in the most thorough manner. Some loss of good custom can be traced to that cause. In many cases bicycles that might be displayed with good effect in February and March, for April and May sales, are not ordered until the requirements of good business finally demand them—which delay helps to pile up stocks at the cycle factories, keeps the makers guessing about what future orders will be, and interferes with prompt shipments, if it does not even hinder manufacture and assembling.

It would be nicely in keeping with the reciprocal tendencies now current if one branch of the industry could offer every possible advantage and favor to every other branch without in the least jeopardizing its own interests. The burden is in connection with the establishing and cementing of such relations and knowing positively what agents are soundly and firmly fixed. For the evidence necessary to establish credit there are but two absolutely reliable sources of information, and they are, as already intimated, inventories of stocks and abstracts of book accounts.

If such a system should be popularized, it would mean an indirect benefit to the retailer, corresponding in kind if not in degree to that accruing to the makers through examination by expert accountants of their plants and books, stocks, etc.

## HOW TO DISPLAY GOODS

### Dispensing Information by Catchy Cards—Window Decoration in Red—Elevated Display Stand

Value  
of Printed  
Announcement

The fact is often overlooked that passersby glancing into a store window are more apt to afterward come into the store to investigate and purchase if the window contains definite announcements of an attractive nature than if the display is merely one of a general character, simply denoting that the store it fronts is a bicycle salesroom. People generally prefer information which is absorbed unconsciously to that thrust upon them by a glib talking salesman. Some dealers take advantage of this condition and place in the show windows, together with the models displayed, tastily lettered cards bearing a few well worded facts which are intended to attract favorable remark from those who notice them in passing. The majority of cycle dealers have not as yet, however, realized the value of this sort of advertising as fully as have the managers of dry goods stores in large cities.

That the public may learn, without asking, the respective equipments of machines displayed in his window, a Chicago dealer has had printed cards upon each of which is given the number of the model, the options in tires, pedals, saddles and handle bars offered with it, and has placed one of these in front of every machine shown in the window. The inexperienced person who cannot distinguish readily the grade of a machine, but who knows by reputation the comparative popularity of various fittings, is thus acquainted with the range and character of the options offered by the dealer. Were there no trade reasons against displaying the selling price of each bicycle handled, the addition of the price to these cards would make them still more valuable.

The same dealer gives it as his experience in selling that many people who enter a store to look around with a view to

the front wheel of each bicycle mounted on a display stand, a card similar to those in the window. The card is secured by passing it under two spokes and over intervening spokes, after the fashion shown in the accompanying illustration, and is thus plainly in view and does not disturb the rotation of the wheel to which it is fastened.

Red Poppies  
and  
Sunbeam Spokes

Dealers handling bicycles with sunbeam spokes and favoring window trimmings attractive because gorgeous, may with but little expense decorate the side and back of a window space in red or some other substantial solid color after the idea presented in the accompanying sketch. The wall surface is first covered with red cloth—if red be the color chosen—arranged in loose vertical folds. A border is then made of paper poppies of a shade of

red somewhat deeper than the background. The tires of several bicycle wheels are next covered with poppies, and a bunch of these is placed at each hub. By securing the wheels to the wall in some symmetrical fashion, and placing festoons or bunches of the paper poppies here and there, an exceedingly rich effect in red, set off by the sunbeam spokes, is obtained.

Such an effect should only be used in a comparatively small window and the floor and ceiling of the window space must be draped with red cloth to match that used as a background on the walls. One bicycle enameled to contrast properly with the trimming color is sufficient to complete the window. Such decorations are ruined in their effect by the introduction of a large number of bicycles, or piles of sundries, which form an unpleasant contrast between the artistic and commercial styles of window dressing.

Platform  
Displaying  
Several Models

The most common type of store arrangement is doubtless that in which the machines on display are arranged in rows along the side walls of the store. The center space is sometimes left entirely open, but where there is sufficient width

to the store room, groups of machines on exhibition stands are placed in the exact center of the open space. Where such grouping is possible, the idea presented in the accompanying illustration will prove effective. An oblong stand about eighteen inches high and built from the same wood as used in the finishing of the store room is erected in the center of the floor. It is best made large enough to hold five machines, each supported on some sort of exhibition rack which allows the wheels to be revolved. The height gained by the platform makes unnecessary the use of elevated stands to bring the bicycles to an approximate level with

the view of the visitor. A rich Brussels carpet, or linoleum covering, is used on the platform, according to the prevailing style in the furnishings of the store. Various equipments and parts used in the construction and outfitting of the bicycles displayed can be laid around the sides and front of the platform in unconventional groups, and, if desired, a stack of catalogues may be placed in a conspicuous place. Floor room is gained and the general effectiveness of the platform enhanced by cutting off each of the front corners on an angle of forty-five degrees.

If floor space be limited and it is desired to display more bicycles than can be accommodated without crowding, several machines may be shown on each side wall of the store by securing to the walls projecting hooks arranged in pairs, so that a bicycle may be caught under the top rail at the steering head and seat cluster. The hooks should be high enough to allow the models supported to swing free from the machines on the floor be-

Hanging Cycles  
Along  
Store Walls

low. Rubber tubing drawn over the round iron hooks will prevent the enamel from being marred. This scheme is especially adapted to the display of juvenile patterns. In some stores a high wainscoting runs around the wall, and in such a case the hooks may be very readily attached to the molding which covers its upper edge. Where there is no such molding the hook supports must be fashioned so that they may be screwed directly to the wall.

learning as much as possible in order to buy well later on, are better satisfied to be let alone and to make their own observations than to be immediately, upon entering the store, captured by some salesman and given a long lecture upon the merits of some particular model. That such people may be aided in their quiet search for information, and at the same time be insinuatingly told the merits of the machines inspected, there is placed in

TRADE MARK

# AN AID TO FOREIGN BUSINESS!

THAT'S WHAT THE DUNLOP  
DETACHABLE TIRE IS

*Read what an Australian dealer says:*

"We would advise the English manufacturers not to content themselves with the present condition of affairs, or to think too lightly of the American competition in the Colonies, as we find them building their bicycles with all the popular English ideas, Westwood Rims, Dunlop Tires, brakes, mud-guards, etc. Our experience in the trade convinces us that the weight of the English lady's bicycle is a great drawback to its sale. The light, stylish American article is growing in favor every day."

TRADE MARK

# ...Decalcomania Transfers...

Anything for bicycles and dealers in the way of decalcomania transfers and decorations, name plates or special designs can be had from us or our jobbers

The bicycle repair man who has not yet put in a line of bicycle decorations misses an opportunity of a nice little field for the extension of his business—that of decorating the frames given him to enamel. We are willing to give any man in the bicycle business our catalogues and samples for the asking. Our instructions for applying a transfer are thorough and enable any novice to make a success after a few trials. Our product is guaranteed satisfactory. Write us for catalogues, samples and prices. Remember we are the largest manufacturers of transfer ornaments in the world, have exclusive automatic machinery, are American makers of guaranteed quality, can deliver on short notice, are exempt from heavy customs tariff and treat our trade courteously at all times.

## CURRENT SHOP PRACTICE

### Inexpensive Spanner of Great Utility—Tied Spokes Unpopular—Ingenious Method of Drawing Temper

#### Remedy for Tarnished Nickel

Many of the bicycles which come back into the assembling room of factories for repair or overhauling look dingy because the nickel plated parts are no longer bright. In most of such instances the nickel is not rusted, but has merely lost its brilliancy. If the job is such that it will merit the expense, the parts are commonly renickeled. Unless, however, the machine is in such condition otherwise that its owner will willingly stand the nickeling expense, the parts are best put in a satisfactory condition by polishing them on an ordinary soft buffing wheel.

Repairers in factories and in repair shops have not generally recognized the great change that can be wrought in tarnished nickel by the buffing wheel. Any nickel plated part, so long as it is not rusted clear through the nickel coating, may be rubbed on a buffing wheel treated with any of the reliable standard forms of nickel polish till its original luster has been restored. Even thin rust, which has not penetrated the nickel, can be removed so completely that no signs of its previous existence will remain. While a machine is undergoing other repairs the nickel plated pieces can be conveniently treated to the buffing operation and but little time and no capital spent on the job. Such work always pleases the customer, who generally believes that new plating throughout is the only remedy for tarnished bright parts.

#### Easily Made Universal Spanner

In all factories and repair shops there are many needs for some sort of a wrench or spanner which will fit various sizes of round screw-threaded attached parts, and which will unscrew the same no matter how tightly they may be bound in place and without marring the finish. The Stilson wrench has enjoyed more or less popularity for this purpose, but it falls short of answering all needs because it ruins easily marred finishes and because even the smallest size is often too bulky to accommodate itself to many parts which it is desired to remove.

A workman recently constructed the wrench or spanner shown in the illustration,

using as his materials a piece of old chain and an old bicycle crank. The hub end of the crank used for this purpose is cut off just above the enlargement and the extremity of the long portion remaining is filed down so that it will slip between the blocks of a chain link. By slipping the end link of a short stretch of chain over the crank end in this fashion and riveting the other end of the chain loosely to the extremity of the crank, the spanner is completed. A span-

ner made with seven attached chain links will accommodate round parts to be turned, varying in size from about one and one-eighth to one and three-fourths inches in diameter, and the pull which may be obtained with it is never failing in its effectiveness. By using a few more chain links of a pattern in which the side links are detachable without tools, so that any link in the stretch of chain employed may be slipped over the crank according to the size of stock to be turned, the adaptability of the spanner is made almost unlimited. It will be readily understood that the range of sizes which may be accommodated by a certain number of chain links is due to the fact that the parts to be turned may be caught in different positions relative to the lever arm, according to their respective diameters.

#### Tied Spokes Passing Out of Use

It is a noticeable fact this year that in by far the greatest number of new bicycles the spokes are not tied together in pairs. The custom of tying spokes has existed with varying popularity ever since the introduction of the tangent spoke, and during several recent years became a widespread practice. But now, for some reason, the tied spoke seems to be in disfavor.

Just why manufacturers ever began the practice of tying spokes cannot be readily explained on any other ground than that the wheel with tied spokes is stiffer than one in which the spokes are left free. The extremely stiff wheel has its advantages, but the experience of most repairmen will bear out the statement that broken spokes occur more commonly in stiff wheels with tied spokes than in well laced and trued wheels with untied spokes.

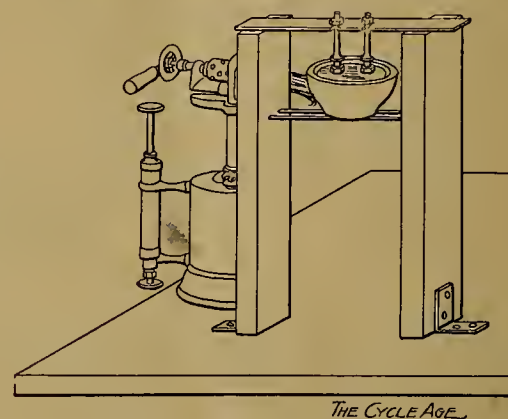

If, after a wheel has been laced up and trued, the crossing spokes are tied together in pairs by means of wire wrappings and solder, or stamped clasps, each spoke will have been pulled from one-sixteenth to one-eighth inch out of a straight line, according to the thickness of the hub flange and the manner in which the spokes are crossed in lacing. This range of distance is calculated from the fact that in untied wheels the crossing spokes pass each other with a clearance of from one-eighth to one-fourth inch.

The primary strain on a bicycle wheel spoke is tensional, and it is perfectly reasonable to suppose that no spoke, wire or bar of any sort is able to resist as much tensional strain when bent from a straight line as when perfectly true and straight. Wheels with tied spokes are doubtless stiffer laterally than those with untied spokes. When a rim, through the twisting strains thrown upon it in jerking into and out of ruts, etc., is thrown over to one side, the spokes on the side toward which the rim is thrust tend to loosen, and if the spokes be tied the combined stiffness of a pair of spokes running in different directions and tied together between their ends is naturally greater than that of a single spoke acting as a unit. It must be remembered, however, that the wheel with the untied spokes, while it may not possess the lateral rigidity of the other type, is possessed of a longer life, for the very reason that its spokes, instead of resisting

each little lateral strain, yield beneath it and spring back to their true line as soon as the strain is removed. During the miles and miles of riding when extreme lateral stiffness is not required of a wheel, and when the load borne by the spokes is one of a strictly tensional nature, each spoke in the untied wheel is straight from end to end and able to bear the full burden within the limit of its strength, and is not held from exerting a straight resistance to tensional strains by being pulled over that it may be tied to some other spoke running in a different direction.

#### Drawing Temper on Finished Parts

In a western pedal factory the following interesting and original method of drawing the temper on certain portions of hardened and finished pedal pins or spindles was recently employed. A large lot of spindles had been finished and nickel plated before it was discovered that the threaded shank which screws into the bicycle crank was too hard on each of the lot. The ill was such a small one that it

did not warrant any temper drawing process which would ruin the nickel or finish on the pins, so an apparatus like that shown in the illustration herewith was arranged. A small graphite crucible was supported on cross rods between two standards from the table at which the operator was working, and in this crucible was placed sufficient lead to nearly fill it when melted. The heating was accomplished by an ordinary gasoline hand torch supported on blocks by the side of the crucible. The flame was directed at the side of the crucible and maintained at a pressure sufficient to keep the lead well melted. By means of a piece of strap iron with a couple of button-hole apertures in its central portion, two pedal pins could be suspended above the crucible at a time, each being immersed in the lead to a depth that just covered the threading on the lower end.

The operator would place two pins in the strap iron jig, rest the holder on the upper extremities of the crucible supporting standards, and, after the pin ends had been immersed in the lead for 20 seconds, remove the holder and pins and dip the latter in a basin of water. The operation was rapid, and as the workman kept an open watch on the table before him by which to time the immersions, was accurate and uniform in its results. The nickeling on the pins was, of course, uninjured, and the temper of the pin was unaltered except at the threaded shank. The scheme, with slight changes in the manner of holding the parts, might be well employed in drawing the temper on portions of any small fittings.

#### English Exports Still Declining.

The English cycle exports for the month of March were valued at \$303,145, as compared with \$482,245 for the same month of last year. For the first three months of 1899 the exports amounted to \$934,235, comparing with \$1,436,935 for the corresponding period of last year.

## Permanency of Types

Compare the present Standard Types of Saddles with the impracticable affairs that have, from time to time, been pushed into more or less notoriety and after a brief existence have disappeared. The inventors of the latter were no doubt honest in their efforts to produce something novel and useful—but, all the more credit is due to those far-seeing men who have steadfastly refused to be misled, and have devoted their brains, energy and money to the betterment of the *Standard Type*—the plain every-day, unfrilled type, which, in its numerous variations of size and style has proved itself the *fittest*, which has survived, and will survive indefinitely.

Every one of these permanent types was originated by us. Not one of the impracticable novelties ever had the endorsement or support of any of our Companies.

It follows that it is safe, shrewd and profitable, and assures permanency in trade to handle only the goods stamped with the familiar trademarks here shown.

We cordially invite you to write us for any information you may desire, and respectfully solicit your business.

## RELATIVE SIZES OF WHEELS

### Varying Opinions on the Most Suitable Sizes of Front and Rear Wheels in Bicycles

To the Editor.—A few words as to "direction of drive thrust," which I claim is from axle to axle, the ground contact being merely a fulcrum. To illustrate this claim of axle to axle thrust, attach a wheel to the end of a pole and roll it over an obstruction by connecting the other end of the pole to another held upright, with lower end resting on ground, applying power at any point of upright as desired. Vary the connecting point of lever with the pole and notice the difference in power required at varying heights. With the lever connected near the ground the wheel may be pushed over an obstruction as high even as the axle itself, which can not be done with the lever connection at or above the axle level. In my opinion, this connection of the lever with the pole corresponds with the rear wheel axle, the ground contact being the fulcrum.

Another illustration is the rolling of the rear wheel of the old style bicycle backward over an obstruction. It rolls forward easy enough, but not backward—a poor argument for the upward thrust, but a good one for the axle to axle theory.

There is no thrust from the ground contact of rear wheel to front axle, no more than from a man's feet to the axle of the barrow he pushes; otherwise he would not instinctively lower his hands to force the barrow over an obstruction; his feet would do it. Yours truly. J. I. BURNHAM.

Mr. Burnham's experiment proves only that the front wheel will pass over an obstacle most readily when the thrust is

delivered in an upwardly slanting direction—which may be taken for granted—but not that the thrust is not so delivered when a bicycle is propelled by its rider.

#### The Test Is Misleading.

Perhaps Mr. Burnham also overlooks that when his beam is attached at a point low on his upright, it naturally requires less power to move the wheel than with high attachment, because his leverage for moving it is increased. With a small rear wheel the leverage would be reduced in proportion. But it may be freely admitted that the low thrust in Mr. Burnham's experiment would be most effective quite apart from the leverage gained for the hand. The objection to the experiment so far as indicating the direction of thrust upon front wheel axle is only that it does not represent parallel conditions.

#### The Direction of Thrust.

On a well-greased floor it is easily possible to make the rear wheel revolve without imparting any forward movement to the bicycle, if there is an obstacle before the front wheel, and this may show to anybody who requires this demonstration, that the thrust which makes the bicycle, including the front wheel, move, is delivered against the ground. It could not be delivered against anything else. As the ground does not move, the bicycle must move. Now, this thrust which the rider causes to be exerted tangentially to the ground by revolving the rear wheel around the only point which is fixed in relation to the power and which therefore is the only fulcrum in the case, namely, the rear axle, operates, like all other thrusts, in a straight line. It reacts upon the bicycle in a direction opposite to its own, and it takes effect in the direction in which there is least resistance to mo-

tion. But it does not start off in one direction, toward the axle of the rear wheel, and then change its mind and shoot off at right angles to the front wheel axle. It is transmitted to the front wheel at its axle. If the front wheel were rigidly fixed, or a skate substituted as in ice-bicycles, it would be transmitted at the ground. If a bar were placed in the way of the steering head, obstructing the forward movement of the bicycle, it would be delivered against the bar. But under all circumstances, when the rear wheel is driven it starts from the point where power is exerted against an object outside of the bicycle, viz., the point of ground contact of the rear wheel.

#### Backward Driving of Ordinary.

Mr. Burnham refers to the old Ordinary and the difficulty experienced in driving the small wheel backward over an obstruction. This is easily explained. First, when pedalling backward the rider's weight is shifted considerably to the rear; secondly, the frame is not very rigid; thirdly, there is an important difference between a pull and a push. When the driving wheel of an Ordinary is driven forwardly and an obstacle must be surmounted by the small wheel, the latter has a ready escape by simply turning frame, rider and all upward around the driving wheel axle (the crank shaft). On the other hand, if the small wheel is pushed backward over an obstruction—which, by the way, is likely to be large in comparison with a small wheel—the tendency is the opposite one by pressing the small wheel into the ground. This is only another way of stating that in pulling a wheel after a driving wheel, you pull it from the axle of the latter; but in pushing it in front, you push it from the ground contact.

Fig. 2 shows graphically the difference which exists and which explains why the Ordinary cannot readily be driven backward over an obstruction. When the small wheel is driven backward against B—and B is immovable—the resistance

takes the direction b D, while the only possible direction of motion for the small wheel, so far as overcoming the obstruction is concerned, is D F, tangential to a circle around the center of the large wheel. When, on the other hand, the small wheel is pulled forwardly over obstruction A, the resistance follows the direction a D and the small wheel readily escapes this resistance because the possible motion is nearly in the same direction.

In the comparison with the barrow, it is the hands of the workman which take the place of the rear wheel tire, while the

shoulder joints represent the rear wheel axle, but the comparison is one of those in which the points of similarity are not as important as those of dissimilitude. The whole element of rigid connection is absent, and it is not the feet which drive, but the weight of the workman leaned against the barrow.

#### How an Obstacle is Surmounted.

The whole subject would hardly be worth extensive comment except for the inference which has been erroneously drawn in favor of small driving wheels.

In connection with the question of front drivers or rear drivers in motor vehicles, a number of construction features depend more or less upon obtaining the best direction of the thrust by which the carrying wheels are propelled. In bicycles of the type now universally used, being rear driven, the whole matter is best shown graphically as in Figs. 3, 4 and 5, representing three different combinations of wheel sizes, and indicating the chances which the front wheel has for overcoming an obstacle in each case. In Fig. 4 the front wheel is shown as much increased in diameter as in Fig. 5 the rear wheel diameter is reduced. It will be noticed that the driving force operates at

the same angle in Fig. 3 as in Fig. 5, while the angle indicating the escape of the front wheel from impact with the obstacle is in favor of the small rear wheel. In Fig. 4, however, the driving force operates at a more advantageous angle than in either of the other cases, and the angle of escape is also smaller. When hereto comes that an obstacle which is to be overcome by the front wheel must also be overcome by the rear wheel, it is readily seen that a much greater advantage is gained by increasing the size of the front wheel than by a corresponding reduction of the size of the rear wheel.

#### Making Connecticut Dealers Liable.

Inquiries are being instituted by the state insurance inspector of Connecticut regarding the business being done in that state by the Travelers' Bicycle Casualty Company of Washington, D. C., which is not licensed to do business in that state. It is understood by the inspector that the company is trying to get dealers to take hold of its policies and give them as inducements to purchase bicycles. But anyone selling its policies is liable to a fine of \$100, while the general agent in the state is liable to a fine of \$500.

The company claims to insure wheelmen against accidents while riding, but according to the inspector, the policies

are so written that the company can in almost every case elude settling claims for injuries. As an extra inducement to wheelmen a policy for \$1,000 in the United States Casualty Company of New York is thrown in at the same price, \$5 per thousand, for the bicycle accident policy.

**REPAIR PRICE SCHEDULES**

**Evils Caused by Existing Irregularities Can be Overcome by Wide Adoption of Uniform Scale.**

(Reprinted from The Cycle Age.)

On another page there is presented a list of the repair prices in various towns. In looking over the list it is at once apparent that great irregularities in prices prevail; that the same piece of work is estimated as being worth very much more in one town than in another. In several instances some towns in which greatly varying prices are charged, are so close together on the map that it must happen frequently that cyclists from one of the towns visit the other town and have occasion to become acquainted with the variation in charges.

The moral effect of this condition is, of course, to prime the public thoroughly with the idea that all repair prices are arbitrary and extravagant, and thereby bring about a general suspiciousness and ultimately force prices all over to the lowest notch. When that point has been reached the ambition to do good work, on the part of the repairman, must gradually vanish and give way to a desire to do as little as is absolutely required for obtaining the depressed price which the customer grudgingly pays.

If a somewhat uniform scale of prices could be adhered to the downward tendency which has already gone too far, might perhaps be arrested and a higher standard of workmanship would eventually follow.

The experience with uniform price schedules has, however, not been altogether successful except in places far removed from the centers of the bicycle and parts-making industries, and before any attempt is made to reach a general and fair estimate of what each of the most common repair jobs is worth, the cause of previous failures should be looked into.

A repair price schedule should be flexible enough to suit existing conditions, and it should not be plainly inimical to the interests of the public who are expected to pay the charges.

Better results may be expected from a schedule which gives maximum prices for the information and protection of the public while leaving the repairman all the latitude which he may desire for showing special favors to customers by lower quotations when circumstances warrant them.

**Reckless With His Plunder.**

Milwaukee, April 24.—A large leak in the Andrae factory was discovered a few days ago, and in consequence Steven Kunkel, one of the trusted employes, is now an inmate of the penitentiary. For a long time bicycle parts have disappeared from the factory, and while others were suspected, no thought was attached to Kunkel, as he was supposed to be a man of exemplary character. This belief was dispelled, however, when city detectives made a private examination of his room, with the result that more than \$500 of stolen property was recovered. Kunkel was doing quite an extensive business manufacturing bicycles, but he became reckless, and it was the low price at which he was selling that attracted attention and suspicion. Wholesale robberies are complained of by local manufacturers, but up to the present time the investigations of the detectives have been successful in the Andrae factory alone.

**PHILADELPHIA REPAIR PRICES**

**TIME WORK MADE THE BASIS**

**No Regular Schedule Has Been Adopted But Charges Are Uniform—"Cheap Johns" Ignored.**

Philadelphia, April 24.—While no fixed schedule of charges has been adopted by the bicycle dealers and repairmen of this city, a canvass of the principal houses develops the fact that there is a remarkable unanimity existing as to the prices charged for repair work of all descriptions. The subjoined list is made up by averaging the charges of each of several firms for the varieties of work mentioned, and is not to be considered as the repair schedule of any particular house. In making up the list no cognizance was taken of those firms which knock down a bicycle, cut down the frame to fashionable proportions, re-nickel, re-enamel, re-stripe and re-assemble "all for the small sum of \$3," for it is credibly asserted that some of these fellows put in the drop with a mallet after heating the frame and that there are noticeable bends in some of the tubes after the operation of painting with tar paint has rendered the abused machine, in the advertised words of the proprietors, "as good as new." In this connection it cannot be said that the competition of these ridiculously low-priced repairmen has in any way hurt the business of the "legitimate" dealers and repairmen. It has been noticed that in many instances these cheaply repaired machines have eventually found their way into the shops of the "legitimates" for a thorough overhauling at regular rates.

**Time Work the Basis of Charges.**

The average cost of time work, which is the basis on which repair charges are made in this city, is 50 cents per hour. Some firms charge as much as 60, some as little as 40, but 50 cents is a fair average.

The larger houses, some of which have facilities for turning out great quantities of work, often do considerable repairing for the smaller dealers, and in these cases it is the usual custom to allow the latter a 25 per cent discount, and in those instances where the charge is made up wholly of time work it is put in at about 40 cents an hour instead of 50.

The appended list is based on the assumption that the bicycles needing repairs are comparatively up-to-date. Antiquated patterns needing new parts (which are often difficult of access) are subject to special rates. An effort has been made to itemize the cost in many of the repairs mentioned in order to assist the reader to a knowledge of the different operations necessary before such repairs are completed, and the cost of each. Here is the list:

**Repairs to Frames.**

- (When received separately.)
- Head lug, each .....\$ .30
- Fitting, brazing and finishing, 2 hours at .50 .....
- Enameling, plain ..... 1.50
- Putting in two lugs, 1 hour additional time.
- (Estimates made when tubing is required.)
- (When not received separately.)
- For taking down and assembling, 2 hours at .50 .....
- Taking out a tube and inserting new one, 2 hours at .50 .....
- Aligning frame, ½ hour at .50 .....
- Flush joint frames:
- Putting in new head, heads, each... .50
- Labor, 4 hours at .50 (when not necessary to put in new upper and lower tubes) .....
- When upper and lower tubes are necessary, 6 hours' time at .50 .....
- Tubes, upper .....
- Tubes, lower .....
- Other frames:
- In case of broken lower tube, putting in new tube and plain re-enameling frame .....

- Putting collar around tube, under the brace, including plain enameling..... 3.00
- Both tubes replaced, including plain enameling .....
- (One dollar is deducted from above charged when frame alone is brought in for repairs.)
- Cutting down frame:
- Bicycles with external fittings, including putting in of new lower center tube .....
- (This does not include taking down and assembling bicycles for dealers.)
- Changing models with external fittings to flush joint at head, in connection with cutting down frames, additional cost .....
- Cutting down bicycles with internal fittings .....
- (These charges include enameling plain black.)

**Repairs to Front Forks.**

- Putting in fork ends:
- One pair fork end forgings .....
- Fitting and brazing, 2 hours at .50..... 1.00
- Enameling, black, .50; colors, .65; white, 85.
- Striping, plain .....
- Striping, with ornamentations .....
- Taking out front fork and inserting new one, ½ hour at .50 .....
- Aligning fork, ¼ to ½ hour at .50
- Putting in fork sides (when forks are received separately):
- Sides, each, .20 to \$1, according to grade of machine.
- Labor on one side, 1 hour .....
- Putting in fork crown (when received separately):
- Crowns, each, .25 to .60, according to the grade of wheel.
- Labor, from 3 to 3½ hours at .50.
- Refinishing extra.
- Putting in fork stem:
- Stems, each, .55 to \$1, according to the grade of bicycle.
- Labor, 2 hours at .50 .....
- Refinishing extra.

**Seat Post Repairs.**

- One stamping .....
- Fitting, brazing and finishing, 1 hour. .50
- Nickel-plating ..

**Handle Bar Repairs.**

- One handle bar shaft head, fitting, brazing and finishing, 1 hour .....
- Nickel plating ..
- (Additional charges are made for grips broken in removing from handle bar, and for supplying missing parts—grips, each, .10; key, .15; bolt, .10.)

**Repairs to Wheels.**

- Re-spoking (or inserting new hub):
- Spokes, each .....
- Nipples, each .....
- Taking down and assembling, 2½ hours ..
- (Above charge includes cementing tire.)
- Putting in single spokes:
- Cost of spoke, .02; nipple, .01..... .03
- Time charge on one spoke .....
- Truing wheel, extra, according to time.
- (When several spokes are put in, time is charged at .50 per hour.)
- Putting in new rims:
- Rims, each, from .30 to .90 .....
- Two hours' time on each wheel .....
- Cementing one tire to rim, ½ hour... .25
- Varnishing one rim, ½ hour .....

**Crank Repairs.**

The charges for repairing broken cranks vary from \$1.30 to \$2.50 according to grade of machine and whether right or left crank. These charges include time consumed and cost of part.

**Enameling.**

- Frames:
- Single frames, plain black ..
- Single frames, plain colors ..
- Single frames, plain white ..
- Tandem frames, plain black ..
- Tandem frames, plain colors ..
- Tandem frames, plain white ..
- Heads, extra, plain colors or white... .50
- Front forks:
- Plain black ..
- Plain colors ..
- Plain white ..
- Rims only, black, colors or white, including striping, each .....
- Rims, with hubs and spokes inserted, black, white or colors, including striping ..
- Chain guards, black, colors or white, striped ..
- Dress guards, black, colors or white, striped ..
- Taking tire from rim and re-cementing ..
- Cementing tire to rim .....

**Striping.**

- Frames, single striping, gold or silver.. .40
- Frames, double striping, gold or silver.. .60
- Frames single striping, decalcomania corners ..

Frames, double striping, decalcomania corners ..	.75
Frames single striping, decalcomania corners and centers ..	.75
Frames, double striping, decalcomania corners and centers ..	1.10
(These charges include frame and fork, and are in addition to charges for plain enameling.)	
Lettering, per name ..	15

**Overhauling.**

Including cleaning, oiling and adjusting bearings, single bicycle ..	1.25
Tandem ..	1.50

**Tire Repairs.**

Plugging, per plug, 1/2 hour at .50 ..	.25
Vulcanizing, from 1 to 1 1/2 hours at .50 ..	.50
Vulcanizing in valve stems, cost of stem ..	.10
Time, 1 to 1 1/2 hours at .50 ..	

**Lacing Guards.**

Chain guard, including cord, not netted ..	.25
Wheel guard, including cord, not netted ..	.25

**Nickel Plating.**

Handle bar ..	1.00
Sprocket wheel, according to size, .25 to .65 ..	.25 to .65
Front forks at crown and tip ..	.50
Crank ..	.40
Pedal ..	.50
Hub ..	.40
Crank ..	.25
Seat post ..	.25

**WHY PRICES ARE HIGH****Freight Charges, Duties and Cost of Extra Equipment Accountable for Australian Prices.**

To the Editor:—In a recent issue of your paper I notice a paragraph evidently forwarded to you by a correspondent from Sydney, New South Wales, stating that bicycles sell in Australia at a large margin over English and American prices. This is a mistake, as we can purchase in New Zealand and Australia bicycles at the same prices as in England and America, plus freight and duty.

Your correspondent states that the Gould Bicycle Company, Ltd., sells its machines at \$140. In New Zealand there is a duty of 20 percent and 10 percent on the ordinary market value of the goods, which means that you must pay duty on the prices at which anyone can purchase the same machine in America. Notwithstanding this, the Gould Bicycle Company lists its \$75 Canadian model in New Zealand at £16 10s, and its \$100 model at £21.

Considering the expensive methods adopted by the trade throughout Australia in disposing of their machines by consigning to country agents on sale or return, I do not think the prices charged are excessive.

Any number of American and English model bicycles can be purchased in Australia at prices varying from \$15 to \$75. The chief objection against American bicycles in this country is on account of their being fitted with light tires, round cranks, etc., which do not meet with approval. The popular roadster in Australia is a machine fitted with serviceable detachable tires, steel rims, and mud guards. At the present time the Australian market is flooded with bicycles, which are being disposed of through the auctions at what they will bring.

The bicycle which sells best in Australia and New Zealand is an altogether different machine from that sold at home, on account of special items which have to be fitted; for example, single tube tires are popular in the States and utterly useless out here; then again such items as brakes, mud guards, gear cases, special styles of saddles are all extras which have to be added to the price of the standard model in America. You will thus observe that the prices at which the machines mentioned are retailed are reasonable when the very heavy charges are debited against them. Freight alone by the 'Frisco route is about \$17.50 per ton measurement.

Hundreds of bicycles which have been forwarded to these markets in the hope

of ready sale have at last been forced into the auction market and slaughtered. Wellington, N. Z. M. GEORGE PHELAN.

**Saussure's Cushion Hub.**

The invention as illustrated presents really a compound axle consisting of two concentric members separated by a rubber cushion, filled with air or solid; to the outer member the cones are secured in the usual manner. The inner member looks like an ordinary axle without cones and is secured to the frame in the usual manner. Rigid plates secured to this axle and rubbing against the ends of the outer axle-cylinder prevent the latter from wob-

THE CYCLE AGE

bling. The large diameter of the ball bearing in a device of this sort would probably increase the friction at this point considerably, and the chain tension would of course prevent the cushion from operating in any direction except one approximately vertical. The same chain tension would make a strong effort to warp the end plates and in connection with a good wrench a jolt might succeed in buckling the front sprocket. The inventor is R. de Saussure, of Brookland, District of Columbia.

**Readily Detachable Pedal.**

The pedal illustrated is the invention of Eugene Germaine, of Paris, France, and has been patented in this country. His object has been to produce a pedal which is positively fastened in the crank eye and which may be very readily stripped and cleaned. The first object is attained by tapering the inner crank end and locking the taper fit by means of the inner cone which acts as a lock-nut. The spindle at the outer end is formed with a cross piece or T over which the outer cone

THE CYCLE AGE

may pass. This cone on its outer face has two notches quartering with the slot that allows it to pass over the T. When passed it is given a quarter turn, bringing the notches in engagement with the T, and it is held in this position simply through the pressure exerted upon cup and balls by means of a spring bearing against the outer half of the telescoping sleeve surrounding the spindle. A cap protects the outer bearing. The pressure of the spring upon the bearing parts will evidently not make this pedal a free-

spinning one, but when foot pressure is applied the small additional friction produced by the spring is probably a factor of small consequence. In the way of strength the pedal would probably leave much to be desired, but it contains a hint or two that in some other form might be available for our pedal or bicycle manufacturers.

**Cycle Company President Indicted.**

A grand jury in Cincinnati has returned an indictment for grand larceny against M. A. Barringer, said to be president of the Capital City Watch & Cycle Company, and a bench warrant for his arrest is in the hands of the sheriff, but Barringer has left the city. It is alleged that several gentlemen living in the country invested small amounts of money in the company and now claim that the company is not what it was represented to be. The indictment against Mr. Barringer has been kept secret and the specific charge against him is not announced.

**Old Officers Re-Elected.**

The annual meeting of the stockholders of the Joseph Dixon Crucible Company was held at the company's main office, Jersey City, N. J., April 17, and re-elected the old board, consisting of Edward F. C. Young, John A. Walker, Daniel T. Hoag, Richard Butler, William Murray, Alexander T. McGill, and Joseph D. Bedle. President E. F. C. Young, Vice-President and Treasurer John A. Walker and Secretary George E. Long were re-elected by the directors. Judge Joseph D. Bedle was also re-elected as counsel.

**Union Company Increases Wages.**

The Union Cycle Manufacturing Company, Highlandville, Mass., has increased the wages in its polishing department from 5 to 20 per cent, the wage limit also being increased from \$3 to \$3.50. This more than restores the several cut-downs made during 1897 and 1898, and gives the polishers higher wages than they have received for more than five years. The number of hands affected is twenty-five.

**Fire Damages Frames and Parts.**

The Speedwell Bicycle Manufacturing Company of Buffalo sustained a loss of between \$3,000 and \$4,000 on its stock of uncompleted bicycles by a fire which started in the office of the plant last Friday. The machinery room was uninjured. A large number of nameplates were also destroyed. The loss on stock is fully covered by insurance.

**Rochester Supply Co.'s New Officers.**

At a meeting of the directors of the Rochester Bicycle Supply Company, of Rochester, N. Y., recently, the following officers were elected: President, George C. Crippen; vice-president, William Hawley; treasurer, George W. Aldridge; secretary and manager, Thomas Leahy.

**Sale of Punnett Company Accounts.**

Frank J. Hone, as receiver of the Punnett Cycle Manufacturing Company, of Rochester, by order of court will sell uncollected accounts at public sale April 29. The receiver reports: Receipts, \$10,335.91; paid out, \$1,232.04; claims filed, \$20,711.58.

**Cement Makers Burned Out.**

The building occupied by the Michigan Bicycle Cement Company, in Niles, Mich., was recently gutted by fire at a loss of \$3,000; fully insured. The fire threatened the whole business portion of the city.

# COMMERCE IN FOREIGN MARKETS

**Influence of American Design**

The influence and increasing popularity of American models in England are strikingly shown in the new Rover models.

The tread is narrower, the crank bracket is dropped fully 2½ inches, the steering head is shorter, and the finish to the outward details is equal to the finest American productions. The enameling is finer, the nickeling of a higher quality, the hubs are barrel pattern, and the chain half-inch pitch; and altogether the general effect and equipment is vastly superior to anything yet turned out by one of the oldest firms in the English cycle industry.

**Value of New Zealand Trade**

In spite of the fact that the native Maoris do not take kindly to the bicycle, the volume of cycle trade transacted by New Zealand dealers is very extensive. Moreover, the country buys cycle material and parts in considerable quantities, and the small maker does a thriving business.

In the eyes of the Maoris, the bicycle is the latest instance of the white man's folly. The leading medicine man of a large Maori township has declared with unanswerable logic that "the man who rides a horse and shoves it along with his foot is a fool, and might as well walk." The saying is accepted as wisdom by the tribes, for the Maori holds that exertion of all kinds is an abomination, and that exertion which is not necessary for the primal needs of existence is self-exposed folly.

To illustrate the value of New Zealand as a foreign market, it may be stated that during the first three months of last year 1,955 bicycles were imported, valued at \$97,815. This, however, shows a considerable decrease from the corresponding period for 1897, for during that period 3,438 machines were imported, having a total valuation of \$194,190.

The four leading ports of entry are Wellington, Dunedin, Lyttelton and Auckland. Throughout the year 1897 there were 11,496 machines imported. Since 1894 New Zealand has taken upwards of \$2,000,000 worth of cycle goods from England and America.

**Assemblers Busy in Victoria**

Bicycle assembling is practiced on a large scale in Victoria, Australia. In Melbourne and its suburbs there are between

sixty and seventy small manufacturers who make up their machines principally from English parts and construct their models on English lines. There are other local builders in such important country centers as Castlemaine, Geelong and Ballarat, the population of which towns is, respectively, 6,500, 20,000 and 21,053. These machines are sold to a class of riders who have an inherent prejudice against paying high prices. They want something cheap and, like a similar class in America, have their own peculiar ideas of design in detail and equipment.

Some of the higher priced machines made in large factories are selling in Victoria for more money than the same models of two years ago. Well informed tradesmen say that there is a lot of nonsense written concerning the decay of the cycle trade in Victoria, and support their statements by drawing attention to the climate, which is particularly well adapted to the pastime. There is a marked depression felt in the Victorian cycle trade, however, which, in the opin-

ion of experts, will not last for any lengthy period. The number of auction sales recently held have in no small degree contributed to the prevailing dullness, but it is the expectation that as soon as some of the overstocked and financially crippled firms have come to the end of their tether business will right itself. The wage earning class in Victoria is soon expected to heavily augment the ranks of riders.

The time payment system has been reduced to a fine art by one large Melbourne establishment. In spite of the necessarily heavy expense of collection, interest, wear and tear and guarantee, this firm has found the time payment system to work satisfactorily. It gives a two years' guarantee to city riders. Its time payments are adjusted to suit the pocketbook of the humble and encourage them to purchase, and, in spite of the fact that recruits are largely drawn from poor people, losses are few. The practice of this firm is to deliver machines at a cost not to exceed that which the rider, under ordinary circumstances, would expend for car fare in a month.

In the opinion of the cycle trade, racing has seen its best days in Victoria. Tourists and people who ride to and from business more than make up for what public interest has been lost through the decay of the sport. Society people, as in other quarters of the world where cycling has attained a more or less matured growth, have resorted to other pleasures than that which the bicycle affords.

**Discounts in South America**

European concerns still find it difficult to deal directly with the Spanish-American buyer in merchandise exclusive of

staples unless a term of from three to six months' credit is allowed. The question of dating or time, or whatever else it may be called in the export trade, is one of far more importance than discount, and in many instances overbalances all other particulars of sale. It is useless to think that any volume of business can be done on cash terms; there are too many who are ready to take commissions from reliable houses on a credit understanding.

European manufacturers and merchants have demoralized the export trade datings and discounts from an American point of view. With American business men the effort is to turn over capital as often as possible, the profits of manufacturing being greater than those derived from interest, and as a consequence inducements are offered for prompt settlements, but with European merchants it is exactly the opposite. They aim to credit only those who are known to be reliable, and with such trade it is a question of how long the debtor can be persuaded to keep possession of the money, when it is drawing from 1 to 2 per cent per month.

Money lent in this manner at from 12 to 24 per cent per annum is a profitable investment for the European capitalist, who cannot get more than 3½ per cent if securely invested at home. Foreign manufacturers have, therefore, encouraged slow payments with substantial, reliable houses, but during late years there has been a perceptible change in the methods of buying.

South American merchants realize more and more the advantages and extra profit to be derived from prompt payments, and many such houses have increased their

capital so as to be able to take the full advantage of discounts.

On the other hand, it should be remembered that an allowance of 6 per cent per annum is no inducement to offer South American merchants for prompt payments. Capital is worth much more in their own trading negotiations. It is nothing unusual to see good commercial paper sold at an equivalent discount of 15 per cent. Considering the methods still in vogue of extending long terms of credit to the inland traders and the natural scarcity of ready funds, three-quarters of one per cent is more of an inducement for prompt payment among South American buyers than ½ per cent per month is among the American trade.

**Exhibiting for Foreign Buyers**

In the probable event of the materialization of the plans of the directors of the Exposition of American Manufacturers,

which opens in this city on September 15 next, there will be held in connection therewith an exhibition of cycles and accessories which promises to fall little short, in point of attractiveness and importance, of the annual shows of the erstwhile National Cycle Board of Trade.

President William M. Brewster, of the Philadelphia Cycle Board of Trade, has been appointed chairman of the sub-committee to which this project has been referred, and he and his assistants are hard at work perfecting the details thereof. On Wednesday last a circular letter from this sub-committee, signed by Mr. Brewster, was sent to the leading bicycle manufacturers throughout the country, calling their attention to the coming exposition as being directly in their interests, and soliciting their co-operation in making the bicycle portion of the exhibition a success. The letter urges the manufacturers to apply at once for spaces.

The undoubted benefit to be derived by exhibitors of bicycles from the presence at the exposition of the many foreign merchants who will attend is pointed out, the annual increase in the exports of bicycles and accessories to foreign countries being evidence of the rapid popularization of American models abroad.

**Exports for One Week**

Exports of bicycles and bicycle materials from the port of New York for the week ending April 18 are recorded as follows:

	Bicycles	Materials
	cycles.	rials.
England . . . . .	\$10,478	\$14,932
France . . . . .	13,715	4,024
Germany . . . . .	915	13,157
Africa . . . . .	11,279	108
Argentine Republic . . . . .	3,391	268
Denmark . . . . .	4,392	3,525
Russia . . . . .	4,646	1,377
British East Indies . . . . .	4,005	.....
Sweden . . . . .	2,847	1,417
Belgium . . . . .	1,982	1,458
Mexico . . . . .	2,146	181
Austria . . . . .	2,188	.....
Holland . . . . .	.....	1,546
Switzerland . . . . .	850	99

Totals . . . . .	\$70,525	\$42,453

## SUBJECTS OF GENERAL INTEREST

### The Attorney General on Trusts

In reply to a letter from a Philadelphia citizen, who has interests in New Jersey, to Attorney-General Griggs, saying that he finds among the people great opposition to combinations in restraint of trade, and as a republican hopes the party will meet the issue by beginning prosecution under the Sherman act, the attorney-general writes:

I have your letter of the 7th inst., and because it is evident that you are under serious misapprehensions as to the force and effect of the federal law relating to trusts, called the Sherman act, passed in 1890, I deem it proper to call your attention to some aspects of this matter which you are obviously ignorant of.

In the first place, the constitutionality of this matter was not affirmed last fall, but was affirmed almost immediately after the passage of the act, in the first case which arose, and has been regarded as settled, so far as the constitutionality is concerned, for many years. In the next place, the Sherman trust act does not give to the federal courts jurisdiction over any combination constituting a restraint and monopoly of trade unless such trade is what is known as interstate or international trade and commerce.

A combination or trust for the purpose of maintaining a monopoly in the manufacture of a necessary of life is not within the scope of the Sherman act, and can not be suppressed by the federal courts. This was decided in 1894 in the case of the United States against the combination of sugar companies.

As a matter of fact, all the companies which you refer to as now organizing for the purpose of securing complete or partial monopoly of different branches of manufacture are similar to the sugar combination, and are not within the jurisdiction of the federal courts. If amenable to any law they are amenable to the laws of the respective states.

This department never hesitates to prosecute unlawful combinations which affect interstate commerce, and if you will examine the reports of the federal courts you will find very many cases of such prosecution, some effective and some ineffective.

It is a popular error to assert that the attorney-general of the United States has control of the corporations or combinations which engage in manufacture in the various states. This is entirely a matter of state control, and unless the functions of interstate commerce are interfered with, I would be superfluous to attempt a crusade against affairs with which I have no business.

With reference to these large combinations of capital which are now forming, my own judgment is that the danger is not so much to the community at large as it is to the people who are induced to put their money into the purchase of the stock.

### Cables and American Possessions

Stupendous as have been the political results of the Spanish war, they bid fair to be rivaled in magnitude by the economic and industrial. To dig a canal from ocean to ocean, to build a fleet of merchant vessels that will put us once more in our rightful place as a leading maritime nation, to hold the position we are already winning of primacy in the world's commerce, are inseparable concomitants in the sudden and great transformation of our foreign relations and policy. Money, time, labor, thought, must be lavished upon the new works to which the nation has set her hand.

Among those works one of the most urgent is the establishment of cable communication between all the American possessions. If Hawaii and Luzon are to be controlled from Washington, they must be joined thereto by direct lines of intelligence. The transmission of messages from Manila to New York across thousands of miles of foreign lands may answer very well while we are on terms of at least outward amity with their rulers, but the bursting of a very small war cloud over the wrong spot would leave our Asiatic colonies as effectually

shut off from us as if buried under the ice cap of the south pole.

The political argument in favor of a trans-Pacific cable is perhaps secondary to the economic one, which can graphically be presented in a few figures. While the trade of the countries commercially adjacent to the Philippines now amounts to more than \$2,000,000,000 annually, \$1,200,000,000 of this consisting of imports, the United States, notwithstanding the wares she offers are largely of the kinds in demand, receives not six per cent of the total amount. The volume of business awaiting diversion to our shores is therefore enormous. That direct cable connection, a canal through Nicaragua, and a larger fleet of merchant vessels would do much to turn the Far Eastern commerce in this direction, is almost axiomatic.

The United States government is keenly alive to these facts. Although the appropriation for a cable to Hawaii, which is to constitute the first link in a chain reaching westward to the Far East, failed in the late Congress, there is little doubt that the money will be voted at an early session in the future.

### Overcrowding in the Large Cities

One of the nation's senators has said that everybody is flocking to the cities and overcrowding them, while the broad acres that should support the population are being neglected; and he adds that if he were a young man he would jump right out into the country and become a farmer. The senator's idea reminds one of the committee of Chicagoans who, after the world's fair and during the hard times following, felt it their duty to gather in the many stranded attendants at the fair and the unemployed of the city and prevail upon them to go to the country where, as they were assured, they could get farms, or employment on farms, and enjoy the blessings of agricultural life. The result was that the country surrounding Chicago was overrun with tramps, many of whom were earnestly trying to get work but couldn't, because farmers were discharging instead of taking on hands on account of the agricultural depression that had been caused by overproduction and the consequent low and declining prices of farm products. Though there has been some improvement in agricultural conditions since, farming is not yet a profitable business because the broad acres under cultivation produce more than enough to support our population and to supply demands from abroad and prices consequently are still too low to give good profit.

Manufacturers are consolidating for the purpose of reducing expenses and preventing overproduction. The hordes of official and other employes they are discharging increase the number of the unemployed in the cities and reduce the number of the consumers able to buy, and if they could jump right out into the country and become farmers, as the senator urges, by so much the more would agricultural products be increased and buyers thereof decreased and farming made less profitable.

But they cannot jump right out into the country and become farmers, because they have not the necessary means or knowledge. Lands that are sufficiently good and well located to yield fair returns at prevailing prices of products, are costly, and it takes a good deal of

money to provide the necessary stock and machinery for successfully operating a modern farm. Even the renter must have considerable means. In short, most of those who might go out from the cities and undertake farming would not improve their condition, for those who had means to buy and operate a farm would fail through lack of knowledge of the business, those who had only enough to become renters would be still more likely to fail and for the same reason, while those who had no means could do nothing better than take places as hired men and would have much difficulty in getting such places for the same reason also. There is but one class of those who are overcrowding the cities that might better go to the country—the young men raised on the farm who have gone to the city with the hope of bettering their condition but have failed to get into paying business or permanent situations.

### Powerful Incandescent Light

According to English chemists, Prof. Nernst's incandescent light is one of the greatest discoveries of the age. That

Professor Nernst had discovered a new light has been known for some time, although the general details of the invention, or more properly speaking, discovery, were not made public until quite recently. That the incandescent electric lamp now in general use is by no means an ideal one has been fully appreciated by scientists for some time, but in lieu of something better it has been almost universally adopted.

The principal objection urged against the incandescent lamp in its present form is that it requires a considerable amount of current to raise the carbon filament to the point of incandescence, and further requires, though less, still a large expenditure of energy to maintain that incandescence. In other words, the proportion of the luminous radiation to the total radiation is very small. The experiments which Professor Nernst has been carrying on for some time were apparently with a view to overcoming these defects, and how well he has succeeded may be gathered from the fact that his new incandescent light is said to require but approximately one-third the amount of energy of an ordinary incandescent lamp.

The light recently discovered by the Gottingen professor differs materially from the ordinary form of lamp in that no vacuum and no fragile filament are required. In the place of the filament a rod composed of magnesia or other rare earth is made use of, which Professor Nernst discovered could be kept in an intensely luminous condition by a very weak current under certain circumstances. The essential point of the invention is that the rod must first be heated above 6,000 degrees Fahr. before it becomes a good electrical conductor. Other inventors have from time to time endeavored to adapt metallic oxides, such as alumina, magnesia, lime, etc., to incandescent lamps, but have invariably failed, owing principally to these substances being such poor conductors of electricity at ordinary temperatures.

Of late Professor Nernst has been developing and perfecting his invention, and apparently the principal difficulty yet to be overcome before the invention can be placed upon the market is the procuring of suitable appliances for heating the rod of magnesia to the necessary temperature.

## TWO-WHEEL MOTOR VEHICLE

### Independence of Bicycle Design Desirable in Motor Bicycles and Tricycles—A Swiss Machine

It is believed by a great many that the motor bicycle and the motor tricycle have a bright future in the United States, and that the development of this form of motocyling depends solely on making a happy hit in the way of a suitable construction.

So far those who have given their attention to the construction of these light vehicles have apparently been handicapped in their conception of design by a too servile fidelity to the accepted forms of bicycles and tricycles. They have hung their motors on the conventional bicycle or tricycle frame, loading the tubing with burdens which such tubing was never intended to support, and have produced vehicles which created the distinct impression of makeshift work.

#### Tubing or Other Material.

In bicycle frames all stresses are as nearly as practicable compressive or tensile, in either case operating essentially lengthwise of each tubular frame member. The motor bicycle constructors have added numerous and severe break-

ing it clean and in working order. For such frame construction bicycle tubing is probably as poorly adapted as possible. Nothing heavier than a toolbag should be suspended from individual bicycle tubes, however excellent this material is fitted to resist compressive and tensile stresses. Its place is in truss-work, where weight is supported at the angular connections, as in a bicycle at the saddle and rear axle and, in a less perfect degree, at the steering head and the crank hanger.

#### A Rational Beginning.

According to this reasoning the first step to a successful motor bicycle must consist in dismissing the idea of "attaching a motor to a bicycle" and tackling de novo the problem of building a "two-wheeled motor vehicle to be straddled and balanced by its occupant and adapted to be propelled by this occupant instead of by the motive power, at his option."

In regard to motor tricycles the problem might be similarly worded, but in

cle in which the cylinder, Ottocycle, serves as axle for the rear wheel. The design and operation of the mechanism is readily understood by reference to the second illustration, which presents a sectional rear view.

The piston b through the rod c and the crank d rotates the fly-wheels f. Upon the axle of these fly-wheels is keyed a pinion h, which meshes with a gear g secured upon the box q, to which the spokes of the wheel are attached, this

box forming the hub of the wheel and revolving on the ball-bearings o and p. The box is provided at its left extremity with a sprocket wheel over which passes the sprocket chain, through which the engine is started. It carries also four cams m, through which the exhaust valve is operated. At i is shown the automatic air-suction valve. The ignition is by tube or electricity at option. A casing incloses the entire mechanism.

#### GAS ENGINES OSTRACIZED

Chicago Policemen Are Instructed to Keep Gasoline Motor Vehicles Off the Boulevards.

A nicely upholstered gasoline motor run-about, nickel-trimmed, spick and span, came down Monroe street, Chicago, occupied and conducted by a person whose dress and demeanor would denote plenty of leisure and a large share of worldly goods. He turned the vehicle at the corner of Michigan avenue, intending to take this thoroughfare, but was immediately stopped by the boulevard policeman with the curt remark that traffic vehicles were not allowed on the boulevard. Protests were of no avail. The guardian of law and order pulled out his printed regulations and demonstrated, black on white, that the City of Chicago is bound by its own enactments to insist that any wagon which shares the general characteristics of motor vehicles other than electric, is to be classed as a traffic vehicle, and as such must be denied the freedom of the boulevards. The driver of the now de-classed carriage turned sadly around as he was ordered to do, and wondered if the policeman's instructions were a link in that chain of events by which the stocks of electric motor vehicle companies are to be sent sky-high, or the incident was simply a sign indicating that Chicago authorities are still unaware of the existence of steam and gas-engine vehicles and the purposes for which they are built.

Rigal, in the motorcycle class, made a surprising race and broke all records, road and track, until Bayonne. He covered the distance from Pan to Bayonne, 64½ miles, in 1:58, which breaks Lemaitre's record, from Pan to Bayonne, by 18 seconds. Owing to indisposition Rigal gave the race up.

THE CYCLE AGE

ing stresses applied to one or more of the frame tubes individually, and by doing so have been compelled to add extra material and weight to the tubular frame besides the weight of the motor and driving mechanism.

The accompanying illustration of a new motor bicycle constructed by E. Butikofer of Bienne, Switzerland, though in many respects an advance over previous patterns, affords a very good example of this fatal loyalty to bicycle design.

Decided progress in motor bicycles and tricycles will probably not be made until the material entering into the construction of the engine and driving gear is utilized as an integral part of the vehicle frame, so that strength may be derived from such material, which now is a dead load supported in a thoroughly unmechanical and irrational manner. At all events the vehicle frame should afford a suitable casing for the motive power, etc., so that the prospective purchaser of a motor bicycle would not be confronted with a forbidding display of machinery details or clumsy forms which insult the eye and threaten the imagination with dire prospects of irksome work in keep-

reality it approaches much more closely the more general problem of constructing light, small and inexpensive motor vehicles for one or two persons—a problem to the solution of which French, English and German engineers are now devoting so much of their ingenuity.

In United States the motor tricycle problem is being approached in this sense by the builders of motor vehicles generally with a commendable and promising disregard of ordinary tricycle traditions, but the motor bicycle problem is open for all. Nothing has yet been done to produce an acceptable motor bicycle, motor tandem or mechanical pacing machine, and the differences in the requirements of motor and running gear for two-wheeled machines on one side and motor vehicles generally on the other side, are sufficiently pronounced to make success in the two lines of construction entirely distinct and independent of one another.

#### Motor Is the Axle.

The Butikofer motor bicycle above referred to presents several original features, which may be worthy of study. It is the first explosion-engine driven bicy-

**T**HE rider of a National is always proud of his machine.

It's handsome and well made.

Like a good horse well groomed it adds to its owner's pleasure in simply being "all right."

The real satisfaction in the purchase of a National comes when the buyer finds that his first expenditure is his last. No repair charges or delays later to reduce his cash or spoil his pleasure.

One season on a National and he says—  
*A National Rider Never Changes His Mount.*  
Better join the procession.

## The Racing Man's Trade

The only reason racing men ride certain machines is because they get them for nothing.

The reason most "amateurs" ride Andraes is because Andraes help them win.

A fast rider may win a race on a machine he gets for nothing, but common judgment is in favor of the wheel he pays for because it will help him win.

Whose trade would you rather have?

The man who pays list price for the wheel or the man who pays you nothing or the next thing to it?

## The ANDRAE Racer

will bring you list price every time.

It is the fastest machine made.

Racing men know it and are willing to pay for it.

More Andrae racers were sold in '98 than any other make.

More races were won on the Andrae than on any other wheel.

If such publicity will do you any good and if you want to SELL your racing machines write us for trade prices and our monthly epitomist, "The Andrae Agent."

## TRIP WITH ALCOHOL MOTORS

### Cost of Explosive Mixture Formed from Alcohol Vapors Depends on Taxation—Operates Successfully

There is a wet blanket ready for any enthusiasm for alcohol motors for vehicles that might spring up in either France or the United States on account of the excessive taxation to which the production of alcohol is subject by law. In France, however, there is a certain patriotic motive in favoring alcohol which partly offsets the present exorbitant cost.

The gasoline or petrole-essence which is now so generally employed to form the explosive mixture in motor vehicles is derived from American or Russian petroleum, while wood alcohol may be produced in France in unlimited quantity and may be sold at an exceedingly low price when once legal restrictions shall have been removed. Fully convinced that all internal revenue considerations will promptly be set aside by the French government as soon as it shall have been demonstrated that an enormous, economical and harmless consumption of wood alcohol awaits such a step, a number of French engineers have interested themselves deeply in devising such reconstruction of the carburetors in gasoline engines as would adapt them to be driven by the explosion of alcohol vapors mixed with air instead of gasoline vapors similarly mixed.

These gentlemen, under the auspices of the Parisian cycle daily, *Le Velo*, recently appointed a course for vehicles built for the use of alcohol, and eleven vehicles were announced to take part in the event. It was set for Tuesday, April 11, and several of the vehicles made their appearance in spite of copious rains, which had turned the road to Chantilly into a condition which promised badly for the poorly protected vehicles. One vehicle started, however, and it is the history of its trip which, in the opinion of the French devotees of alcohol—for motor purposes—completely changes the complexion of motor vehicle matters, turning the tables against the imported gasoline and in favor of the home-produced alcohol.

#### Work by Alcohol per Litre.

The vehicle was one designed by Messrs. Briest and Armand, of the small town Villers-Cotteret. It braved the rain and mud with Mr. Briest as conductor and one passenger.

The data of the trip are given as follows: The wagon weighs 840 pounds. The motor is simple and of inferior workmanship. The transmission is by belt and the construction admits of thirteen different speeds, blending one into the next higher or lower speed without abrupt changes. The full distance of 68 kilometers was covered in 4 hours 8 minutes, without renewal of cooling water and with a consumption of 19 litres of alcohol. The vehicle started with nine litres of 90 strength and took in 10 litres on the way, nearly all of which was used.

In the afternoon the vehicle returned over the same roads to Paris, this time covering the distance in 4 h. 0 m. 10 s. and again consuming 19 litres of alcohol.

#### Where Alcohol is Cheap.

The price of alcohol is 85 centimes per litre in France. This makes the cost of driving 68 kilometers 16 francs 15 centimes.

According to estimates of the observers the same vehicle could have covered the same distance under the same road con-

ditions with a consumption of 11 litres of gasoline costing 37 to 50 centimes per litre, making a maximum total of only 5 francs 50 centimes. With the utmost reduction in price of alcohol at which it may be sold at present in France, the cost of the alcohol would still amount to 10 francs 45 c., or nearly double that of the gasoline capable of doing the same amount of work.

But, on the other hand, these discouraging figures would immediately be reversed if the event had taken place in Germany, where alcohol is not taxed so highly. There alcohol for industrial purposes costs 25 pfennig, or 30 centimes, per litre, while benzine or gasoline costs 60 pfennig. At these figures the cost of the trip would be 5 francs 70 c. with alcohol, and about 8 francs 40 c. with gasoline.

The inference is drawn from these figures that in all likelihood alcohol motors have an immediate future before them in the Fatherland, and that its possibilities for other countries are such as should not be neglected by motor vehicle constructors.

### LIQUID AIR WASTEFUL

Scientific Authority Says Tripler Is Mistaken—The Cold Liquid Not Economical for Power.

Some years ago I was called upon to examine an engine operated with liquid carbonic acid, which was said to have ten times the efficiency of an ordinary steam engine, says President Henry Morton, of the Stevens Institute of Technology. I, of course, told the applicant that such a thing was physically impossible, and did not deserve investigation, but, finding that a number of substantial people had been so impressed by what had been shown them that they would not be satisfied without an investigation. I consented to make one. This proved an easy piece of work. I found that the promoters and others were under the impression that a horse-power was measured by the raising of 33,000 pounds one foot high, irrespective of time, and in their demonstrations were contented with showing that their engine did this amount of work in ten minutes. As, however, a horse-power involves the raising of 33,000 pounds one foot high in one minute, it was obvious that the power shown by the carbonic acid engine was one-tenth of a horse-power, and not one horse-power, as those exhibiting the engine claimed. This, of course, explained the situation. An engine developing one-tenth of a horse-power might easily require only one-tenth as much fuel as an ordinary steam engine developing one horse-power, without violating any of the established laws bearing on this subject. The curious thing was that such people as were concerned in this matter should have been misled on such a simple and elementary subject; but if they were, as I personally know, so misled, why may not Mr. Tripler and his friends be in a similar case?

I could give from my own personal experience many like examples, but have said enough for the present to make it evident that what is claimed as a new source of "power which costs nothing" is not founded on fact, but is probably the result of some oversight in observation or

calculation not inconsistent with honesty of intention.

It is stated that Mr. Tripler makes his liquid air at a cost of 20 cents a gallon. It is readily shown that the maximum power obtainable from this liquid air, by heating it to ordinary atmospheric temperature, is three-quarters of a horse-power-hour. This, at 20 cents, would be vastly more expensive than power derived from an ordinary steam engine, whose cost ranges from less than 1 cent per horse-power-hour under the best conditions to 3 or 4 cents, where a profit is included, or the conditions are less favorable.

### TIRE COMPANIES COMBINED

Chase, Newton and American Companies Consolidated—Blaurock Tires for Motor Vehicles.

The International Automobile and Vehicle Tire Company is the name of a new three million dollar organization in which it is stated that L. C. Chase & Co., of Boston and Chelsea, Mass., the Newton Rubber Works, of Newton, Mass., and the American Tire Company, of New York, which controls the patents for Apex tires, will be absorbed.

One of the principal productions of the new organization is to be the Blaurock tire, of which a cross-section view is shown in the accompanying illustration. This tire is based upon the Apex patents and has been evolved by Charles Munger.

Mr. Munger, who is well known to the bicycle trade, undertook some time ago to remodel the Apex tire so as to adapt it for motor vehicles and at the same time obviate the liability to puncture, under which the New York Electric Cab Company has been suffering with the tires

heretofore in use. Having arrived at the design illustrated, Mr. Munger had the Chase company make the tire for him, and it was tested on an electric cab over a considerable mileage. Another pattern intended for road wagons was also turned out.

J. A. Blaurock is the individual owner of Apex tire patents and has consummated the large deal involved in the organization. He is closely associated with Richard Croker, Jr., who is to be vice-president of the company and general manager.

The company is to have close business relations with the New York Auto-Truck Company, in which Mr. Croker is interested.

#### Cheap Vehicle Announced.

Buffalo, April 24.—The Buffalo Spring and Gear Company, makers of light road vehicles, are working on the plans of an automobile which officials of the company assert will be a revelation in the motor line and which will be marketed at the low price of \$400. The motive power is to be gasoline.

New York, April 19th, 1899.

Messrs. G. W. Cole & Co.,  
141 Broadway,  
New York, N.Y.

Gentlemen:-

Referring to the matter of the threatened litigation on the Duryea patent by the Buffalo Specialty Mfg. Co. of Buffalo, New York, against yourselves and others, who are manufacturers of tire fluid in which you and some of your associates have retained our firm to defend any suit that may be brought by said Company, we desire to report as follows:

When this litigation was first threatened several months since, we notified the Buffalo Specialty Mfg. Company that we were prepared to defend any suit that might be brought by them on the Duryea Tire Fluid patent. Up to date the only suit that has been brought, of which we have any knowledge, is one by the Buffalo Specialty Mfg. Co. against the Manhattan Storage Company of Philadelphia.

As soon as this suit was brought we communicated with the defendants and offered to take up the defense of that case, undertaking all expense that might be incident to such defense, and agreeing to indemnify the defendants against any loss or damage in the matter of that case. At first the defendants assured us that we would be permitted to defend the case, but later on they withdrew their consent, and now we find that they have permitted the case to go by default, and that an Order has been entered pro confesso. This means that no appearance or defense has been entered in the case.

A judgment of this character does not establish any rights, whatever, except against the particular defendant against whom suit is brought, that is to say, it does not in any way confirm the validity of the Duryea patent, and therefore, becomes a case of no importance in the matter of stopping manufacturers of tire fluid from continuing their business of manufacturing and selling fluid suitable to be used in connection with bicycle tires.

As far as this case goes, therefore, you and your associates are at liberty to continue to manufacture and sell tire fluid, and we stand ready to defend any suit that the Buffalo Company may bring on the Duryea patent under our retainer from you.

With best regards, we remain,  
Very truly yours,

*Arthur Steuart*

## COLE'S STOP LEAK FLUID

in 4 oz. Tubes, screws to valve—No Pump required. Sells at sight. We guarantee Jobbers and Dealers.

**DAILY GRIST OF WANT ADS.****MOTORS AS SECOND-HAND GOODS****Advertisements Showing the Part Played by Motor Vehicles in Parisian Life.**

A lively and varied mental picture of the motor vehicle activity in France is gained by the perusal of the "want ads" in the daily papers of the French metropolis. In a single issue taken at random, the following items appear:

Conductor, Panhard system, familiar with the care of automobiles, wants situation. References given.

**Dion Motors Lead the Rest.**

For sale very cheap: Creanche tricycle with Dion motor, 1½ H. P., double lubrication chain casing, double reservoir and new detachable trailing cart for two.

Real bargain: Four wheeler, capacity two, 1¾ H. P., Dion motor, as new. Can be delivered at once, 1,700 fr.

Wanted: Dion motor 1¾ or 1½ H. P., second hand; acceptable even if in bad condition.

Four-wheeler wagonette, composed of Dion tricycle with Petitjean fore-runner on springs, large single seat (capacity 1½), double reservoir (gasoline and oil), special rear brake, complete gear change accessories, good as new, perfect working order and guaranteed, 1,800 fr. crated.

For sale: Peugeot racing vehicle, 10 nominal H. P., 20,000 fr. At the Automobile Storage.

One motorcycle, Dion-Bouton, 1¾ H. P., with gong, 1,050 fr. At Automobile Storage.

One motorcycle, Dion-Bouton, 1¾ H. P., 1,000 fr. At Automobile Storage.

**Bollee, Panhard and Peugeot Next.**

Six H. P. Panhard, wagonette for six, latest model, four speeds, elegantly upholstered. Used less than one month. Immediate delivery, 13,000 fr.

Much below cost, two tire casings for motor vehicles, 90 by 65, four air tubes 90 by 65, one 65 by 65.

Wagonette Leon Bollee, 3 H. P., 3 cap., speed gear, mud guards, accessories, 2,000 fr. Same make, 4 H. P., 3 cap., same equipment, 2,200 fr. Both as new, running order guaranteed.

Wanted for cash, second hand motor tricycle, even old, worn model, 500 to 700 fr.

Real Bargain. Absolutely new tri (tricycle), Dion motor, 1¾ H. P., last model, broad air tires, 1,200 fr.

**Traffic Rules in France.**

The government of the French Republic has issued an elaborate series of regulations for motor vehicle traffic throughout France. These regulations have been expected for a long time and comprise 35 articles, mainly embodying the regulations which were recommended by the Automobile Club. The minister of public works has sent the regulators to all prefects in the provinces, with lengthy explanations in regard to the manner of enforcing the decree, and the prefects are expected to provide all civil engineers with the regulations, it being one of the general features of the decree that considerable power to decide doubtful points in regard to safety of construction, etc., is given into the hands of engineers resident in the localities where such questions may arise for legal decision.

**COMPRESSED AIR IN CHICAGO****Owl Cars to be Run With New Motor System—Compound Engines and Reheaters Used.**

Compressed air motive power is to be tried on Chicago street railways at night. An experimental car with motor and an air compressor have been shipped from New York for this purpose. The motors which drive the air cars are similar to

small compound steam engines. They are carried on the trucks under the bodies of the cars. Connection is made directly with the wheels. The high-pressure cylinder drives one pair of wheels, and the low-pressure engine another.

The air which supplies the power is held at a pressure of 2,500 pounds to the square inch in steel bottles under the seats. A water tank or heater containing hot water under a pressure of 225 to 230 pounds to the square inch is also provided. The air goes from the reservoirs through the heater and into the high-pressure cylinder of the engine which drives the car wheels. Then it is returned through the heater and sent to the low-pressure cylinder of the engine, from which it exhausts into the outer air. Sprays of hot water are shot into the air pipes just before they connect with the cylinders.

**ELECTRICS IN WASHINGTON****Virginia Company Will Operate Street Cars, Omnibuses and Livery Carriages.**

Washington, April 21.—The company recently incorporated under the laws of Virginia with a capital stock of \$750,000 known as the Washington Automobile Company, and backed financially by a local street railway magnate, intends to place in operation within the next two months a line of automobile carriages on the streets of this city. Besides operating a line of busses to carry sixteen passengers, the company will also put into service electric carriages for private hire, which will probably be rented from the private livery stables of the city. In addition electric delivery wagons will be put into service, either to be operated by the company or sold to merchants. The carriages to be employed are those of the Pope Mfg. Co., and sixty of them have already been ordered. These carriages will be operated by electricity, which can be charged at any supply station connected with the currents of either of the local electric light plants, which are owned by the syndicate controlling the automobile company.

**Hosepipe Motorcar Tires.**

A patent has been issued to George H. Clark, of Boston, for a single tube tire in which the canvas or fabric on the rim side is slit transversely at intervals before the air tube, the fabric and the outer rubber coating are vulcanized together. The slits extend about half way on the sides of the tire. By this arrangement the rim side of the tire is made stretchable, so that the tire may be forced onto a rim which has a deeper concavity than the ordinary crescent rim and yet fit snugly when in position. The invention is evidently intended for canvas fabric tires only, and especially for motor vehicle tires, for which a deep seat and a broadly flanged rim are very desirable.

**Mossberg to Make Vehicles.**

Frank Mossberg, formerly vice-president and general manager of the Mossberg & Granville Manufacturing Company, at Attleboro and Providence, has formed, though not yet incorporated, a stock company, to be known as the United States Automobile Company. It is the intention to build a factory at Attleboro, Mass.

The Pennsylvania Electric Vehicle Co. has now four vehicles of different types running about the city of Philadelphia.

Major R. T. Davidson, instructor of military science at Northwestern Military Academy, at Highland Park, Ill., has designed an automobile gun carriage intended for Gatling gun service.

**FINED FOR WORKING OVERTIME****HUNDRED THOUSAND WORKERS****De Dion Conflicts With Labor Law in — Trying to Fill Orders—Workingmen Support Him.**

A French tribunal has fined De Dion, head of the great automobile factory of the De Dion-Bouton company, in the sum of forty francs for allowing his employes to work overtime. Count De Dion put in a protest signed by 600 employes against interference with their liberty to work as much as they pleased. The judge recommended the defendant to have the law which regulates working hours repealed and imposed the lowest possible fine.

**The Extent of the Industry.**

During the proceedings it was incidentally brought out that the syndicate chamber of automobile manufacturers, of which De Dion is president, employs one hundred thousand workmen.

**Abbreviated Motor Vehicle Terms.**

Automobile is a cumbersome word in English, but it might be abbreviated front and aft and called a "tomo." An explosion engine vehicle might be designated, on the same principle, as a "plo," while storage battery vehicles already answer the name of "bat." For the steam engine vehicle the term may be borrowed from the chemical composition of water, H<sub>2</sub>O, and it might be called "ho." These names are submitted for prayerful consideration of "tomo"-makers, sellers and users.

**Motor Tricycles in New York.**

Petrol-engine tandems for pacing purposes are being built in New York for use in this year's racing season. Motor tricycles driven by the same form of power are now turned out by the Automobile Company of America, of New York city. They are similar to the French De Dion tricycles, but lighter in weight and appearance. They weigh 160 pounds. New Yorkers have already had a chance to observe these tricycles passing through the streets at hair-raising speeds.

The Studebaker Bros. Carriage Mfg. Company, at South Bend, Ind., has bought a Winton gas-engine carriage.

A Winton carriage is the first vehicle of the horseless kind to reach Salt Lake City. It was purchased by George E. Airis.

The Howard Mfg. Company, of Mount Holly, N. J., whose specialty is hubs for cycles and sulkies, has extended its field to embrace also hubs for motor vehicles, and has received its first order in the new line from a New York vehicle manufacturing company.

**NEW INCORPORATIONS.**

Atlantic Electric Vehicle Co. Principal office, Camden, N. J. Manufacture, motor vehicles of all kinds. Capital, \$100,000. Incorporators: James H. Nixon and Charles P. Rooney, Philadelphia, Pa.; Francis D. Weaver, Camden, N. J.

The American Motor Carriage and Truck Co. Manufacturing and dealing in vehicles of all kinds. Capital stock, \$200,000, of which \$1,550 is paid in. The officers are: President, Albert H. Rolfe of Newton Centre, Mass.; treasurer, W. M. L. McAdams of Newton Highlands, Mass.

The International Automobile and Vehicle Tire Co.; \$3,000,000; half preferred, half common stock.

Federal Car Truck and Motor Co. Principal office, 76 Montgomery street, Jersey City. Manufacture of motor cars, wagons, trucks, etc. Capital, \$300,000. Incorporators: John H. Carnes, Joseph Wells, James F. Fielder, all of 76 Montgomery street, Jersey City.

NEW YORK LONDON HAMBURG

# THE PASTIME AND SPORT

## Cycle Path Movement Growing

There has been a rush in New York to take advantage of the provisions of the Ellsworth side path bill, the preliminary steps to the appointment of sidepath commissions having already been taken by the wheelmen in twenty-one counties. This bill requires the county judge, upon the application of fifty resident wheelmen, to appoint a side-path commission to raise by voluntary assessment a fund for the construction of the cycle paths, which are open solely to the use of those who have contributed to their construction and bear the evidence of having so done in the form of tags on the front forks of their bicycles. In Pennsylvania they are also pushing side-path work under the Parshall bill, but under its provisions the paths will be open to all wheelmen, the expense of construction being borne by a general tax on cyclists. This cycle path legislation is the newest feature of the good roads movement.

## Opposition to Lamp Ordinances

Considerable opposition has developed among the wheelmen of Connecticut toward the bill now before the state legislature making it a misdemeanor for cyclists to ride at night without carrying lighted lamps attached to their bicycles. To some of the wheelmen the carrying of lamps seems an unnecessary hardship and delegations have gone to Hartford to oppose the measure, while cycling organizations have passed resolutions against it. But the greatest argument against the bill comes from those who feel that it discriminates against the cyclists, and if it becomes a law will unjustly force all who ride bicycles to incur the expense and trouble of providing lights for their machines, while all who drive horses are exempt from the obligation.

The last argument is the only one which is tenable. Most of the large cities of the United States, and, indeed, of the civilized world, have recognized the imperative necessity of lights on vehicles using the public highways and thoroughfares after dark, and enforced the carrying of lights on public conveyances long before they passed ordinances compelling cyclists to use lanterns. Every city in this country which has passed a law calling for the use of lamps on bicycles has met with this same unreasonable opposition, but after it has been enforced for several seasons the cyclists themselves have recognized its benefits and now have no fault to find except that all other vehicles are not likewise provided with lights at night.

"Rome wasn't built in a day;" neither were "universal lights" secured in Chicago, and a very few other cities, without a great deal of united agitation of the wheelmen. By themselves first submitting willingly to carrying lights, the wheelmen of Connecticut will put themselves in a stronger position to demand lights on other vehicles. Time was a few years ago when it was an undoubted hardship to have to carry the ill-smelling, foul and imperfect cycle lanterns then in the market. Now, however, there is small ground for objecting to attaching one of the really handsome lamps of the large variety for sale everywhere.

Oil lamps have been brought to a state of perfection where they give little trouble if properly attended to, and the stores are almost overflowing with various styles of acetylene gas and electric lamps for bicycles and carriages. These

are not only ornamental, but give a strong, beautiful light and are cleanly and not excessively expensive.

When \$2 to \$5 invested in a bicycle lamp may be the means of saving a damaged bicycle and very likely a broken bone, it is cheap insurance.

## Century Runs and the Collins Bill

Century, double century and triple century runs have for some years been a feature of cycling life in and about New York city and other New York towns. Since the recent passage of the Collins bill to limit athletic contests to twelve hours' continuous duration certain interested individuals have begun to speculate regarding the legality of organizing and participating in such runs hereafter. These centuries amount to more than ordinary club runs, since medals and prizes of some value are offered to the winners and to all who complete the one, two or three hundred miles within the time limits set. They bring out sometimes 100 or 200 contestants of both sexes and all ages, from the immature youth to the venerable white haired enthusiast.

While there is no reason for condemning the century run per se, there have been many objectionable features in some of these runs and their elimination would be for the elevation of the pastime of cycling in the eyes of the general public. If then the Collins measure can be construed to cover these contests there will be small cause for regret. It would have the effect of shutting out those women and children and aged men who have too frequently figured in them, riding through rain and mud and finishing after twelve hours or more of exhausting exertion in a state miserable to behold. Any cyclist who is unable to ride 100 miles over ordinary country roads in twelve hours ought to be excluded from such a contest.

There is apparently nothing in the new law which will prevent any individual from going for a road record over any distance during any length of time nor to prevent ordinary club runs of 100 miles or more organized solely for the pleasure of the ride.

## Reviving Club Competition

While cycle racing as a sport will always appeal to a certain clientele of considerable magnitude, this following of itself is not yet sufficient to make the formation of race meets a certain and established success. Show features, therefore, must be put forth to add to its patrons a paying share of the general amusement seeking population. This class constantly demands something new, which, even though it may be along the legitimate lines of the sport, still is novel in the sense of being new to the amusement seekers.

Paced racing came most opportunely, gave great impulse to the game, and increased the regular patronage marvelously. Motor pacing seems likely to furnish a needed innovation the coming season; but it will hardly be general enough to supply the whole demand; so it is that live and experienced promoters are adding other new features to their spring programs. Sweepstakes, big money handicaps, and the giving of popular local names to the important races, are among the notable features on the new entry blanks.

Along this line attempts are also being made to revive the club rivalry in ama-

teur contests, which was so potent a drawing feature in the palmy days of club promotion, by encouraging team competition. In the latter new forms are being devised and promulgated apart from the old lines of point counting determined by the order of the finish, practically about the only form of team matches that has been so far tried. The Berkeley Oval management, for instance, has scheduled for its Decoration day meet a mile heat club race for teams of five, one member from each team to ride in each heat. The points in each are to be reckoned on the intercollegiate scale of "five, three, two, one," and the highest aggregate will determine the winning club. The starters in each heat are to be drawn by lot at the post. A banner will be given the winning club and the individual winner in each heat will get a prize.

A recent sweeping challenge from Collett, Hausman and Ertz, the eastern crackjack amateur trio, may also give a novel idea for an all-round team competition. They offer to ride any three amateurs in the country a team race on the old lines, a team pursuit race, or a triplet match, or all three, or Collett and Hausman will ride any team tandem, or Collett will go against anyone single. A combination of all these races figured on an aggregate point basis would make a most interesting form of team competition.

## Cyclists and Defective Streets

Michigan cyclists are much perturbed regarding the recent decision of the state supreme court in the case of Mary Leslie vs. the City of Grand Rapids, in which it was held that the state laws do not require townships, cities and villages to keep highways in safe condition for bicycle riding, the duties of the municipality ceasing with maintenance of safe roads for other classes of vehicles.

There is a feeling throughout the state that the Leslie case did not warrant so emphatic and general a decision as that handed down by the supreme court; that it was not a case of sufficient strength to be taken fairly as an example or criterion where such extensive interests are involved, or a case that called for such a general warning to bicyclists that they could not expect protection in the public thoroughfares.

Mrs. Leslie's injuries, alleged to have been caused by a fall from a wheel which struck a hole in an asphalt pavement, were of an internal character and of such a nature that it was a disputed medical question as to whether they were caused by the accident or by disease. The suit involved her peculiar right to damages against the city, but was not considered in Grand Rapids a fair test, and the League of American Wheelmen declined to assist in fighting it. It was not anticipated that the supreme court would allow it to govern other cases in which a wheelman's rights were more fairly represented.

It is doubted if the decision would be upheld if carried to a higher court, and the L. A. W. is expected to take some action either toward having the decision reversed or preparing a bill for the next legislature looking to the protection of cyclists from defective streets.

The bicyclist takes more chances than any other user of the public thoroughfares and ought to have at least equal protection. A carriage or wagon could pass safely over defects in a pavement

# The Only House of Its Kind on Earth

OUR MODEL NO. 59

Shelby seamless tubing, patent expander at seat post and handle bar, Excelsior swaged spokes, Baldwin patent chain, highest grade enamel, "Columbia" Guaranteed Tires (fully guaranteed). Equipment very best.

PRICE **\$17.50** EACH

that might cause the death of a bicyclist. If a hole in a street caused the breaking of a wagon wheel, the result would not necessarily imperil the occupants, but if a bicycle wheel was broken in that hole, the result could hardly fail to be serious, and the chances are it would prove fatal. And yet, according to the supreme court of Michigan, the man in the wagon, if hurt, might recover damages, but an injured wheelman could not.

### AUSTRALIAN CHAMPIONS MEET

Walne Defeats Jackson and Megson in Match Series  
—Closing Electric Light Meet.

Sydney, March 25.—The last of the electric light race meets run under the auspices of the League of N. S. W. Wheelmen was held in Sydney on March 13 and 14, in the presence of a very large attendance each evening. The "draw" was the meeting of Walne, Jackson and Megson, the three best riders in Australia, in a triangular match, and a mile match between W. McDonald and A. C. Forbes to decide the winner of the Orient plate, a classic scratch run at a previous meet, in which these two riders each gained seven points and thus dead heated. In the run-off McDonald beat Forbes in 2:01 4-5, after a great race.

In the triangular match Walne was to race both riders singly, three heats of one mile each, for a stake of \$500. Walne met Jackson the first night and defeated him easily by winning two straight heats. On the second night the Walne vs. Megson match took place, and resulted in Walne winning two out of the three heats. The first event produced a magnificent struggle between the two champions, Walne gaining the verdict by inches in 2:06 2-5. The second heat was won by Megson by a wheel in 2:07. In the deciding heat Walne won by a length in 2:12 2-5, thus securing the prize and proving his supremacy and his right to the title of champion of Australia. In the deciding heat Walne caught Megson napping and jumped him, gaining a length and a half.

McDonald won the five-mile scratch race the first night in the fast time of 11:01. On the second night Joe Megson won the ten-mile scratch brilliantly in 25:11 2-5 from all Australia's cracks except Walne, who did not start. Few expected to see him win after having ridden three terrific races with Walne, only finishing the last race a few minutes before the start of the ten-mile.

A. C. Forbes appropriated the two-mile handicap from 15 yards the second night in 4:24. Phelan won the half-mile from 60 yards in :57 4-5. Rennie won the mile handicap in 2:07 2-5 and J. Denning the two-mile handicap from 90 yards in 4:30.

The League of Victorian Wheelmen has decided to affiliate with the I. C. A. and arrangements are being made for Australia to be represented by a professional rider at the world's championships in Montreal. It is almost certain that Walne will be selected and Australians will be surprised if he does not shake up the rest of the world's best and carry back to Australia the mile championship. Walne showed his back wheel to Green, Barden, Ainsworth, Bill Martin and other foreign racers so often while they were in Australia that it was monotonous chronicling his wins. Australia will also be represented by an amateur rider, the New South Wales Cyclists' Union (the only body at present affiliated) having decided to send a representative. Test races will be held to decide upon the man. Goodson, who represented the Union last year, seems to have a mortgage on it.

### To Define Racing Men's Attitude.

Officials of the American Racing Cyclists' Union may soon hold an important

meeting in Louisville to take some action in relation to the claim so freely made that the professional racing men and their supporters are wholly antagonistic to the L. A. W. and would welcome the demise of the organization. They say that nothing could be more untrue, as they are not working against the body itself, their fight being against the racing department, which, by the testimony of the L. A. W. officials themselves, they claim, is a self-supporting and practically independent department. The racing men say that they firmly believe in the League of American Wheelmen and would like to see it mount in membership to far more than the 100,000 mark. They believe, with the other wheelmen of the country, in the cause of good roads, all being ardent wheelmen from other standpoints than racing, and they also believe in the baggage bills. The prominent members of the union, believing that the organization should be put on record once and for all time, will strive to have a resolution passed at the next meeting, which will occur, probably, on May 1. In this resolution they believe the N. C. A. will concur, and will request that organization to do so.

### PLANS FOR LEAGUE MEET

Race Series to Determine Best All-round Man—  
Large Prizes—Century Runs and Tours.

Boston, April 23.—At the previous National meets of the L. A. W., the principal events of the week have been the national championships, but the '99 Meet Club has arranged features and attractions which will interest those who are not followers of the racing game. Monday will be devoted to the opening of League headquarters, which will be established at Mechanics building. Information bureaus will be established, and tourists and century riders will find this a convenient point to start from.

Tuesday's programme will open with a century run over the Newburyport course. Details will be made up to form an escort for the various centuries that are scheduled during the week, and an effort will be made to give visiting centuries an opportunity to reel off centuries over some of the finest roads in this section of the country. The remainder of the day will be devoted to short tours in and around Boston. A moonlight run through the park will be the final feature of the second day.

The racing programme commences Wednesday and promises to be one of the most complete and extensive ever offered at a National meet. According to present plans, the total value of the prize list will be in the neighborhood of \$15,000. This amount may be changed slightly to comply with the status of middle-distance racing at the time of the meet. Those in charge of the racing programme have under consideration a scheme that will enable the public to decide who is the best all-around man. By this plan it is proposed to decide the best man at three distances, which will consist of a fifteen-mile paced race, five-mile pursuit race, and one-mile sprint race. The scoring of these events is to be by points, the second man to count one less than the first and so on, the first man in each race to score as many points as there are contestants in the race containing the largest number of entries. The prizes in the paced race will be \$2,500, to be divided as follows: \$1,250 first, \$750 second, \$500 third; for the pursuit race, \$350 first, \$250 second, \$150 third; one-mile sprint, \$250 first, \$150 second and \$100 third.

In addition to the above prizes there will be awarded the following cash prizes to accompany the medals commemorative of the event, \$250 to the first, \$150

to the second, \$100 to the third, making the total cash prizes \$4,250. To this will be added \$1,750, which will be divided equally among the riders in the paced event to assist them in defraying their expenses. This will make the total cash prize for this event \$6,000. According to the present plans, one of these events will be run on each day of the races.

On Saturday afternoon it is proposed to hold a mammoth bicycle parade. Prominent military officials have signified their willingness to assist in this. At the previous meets held in this city the parades formed a striking and attractive feature. It has been suggested that the pioneers of the L. A. W. be invited to act as an honorary escort.

### CRACKAJACKS REDUCING WEIGHT

Wear Several Racing Suits and Train Hard at  
Fountain Ferry—Go to Washington in May.

Louisville, April 24.—Hard work and lots of it is being done by the racing men in training at Fountain Ferry park. The weather has been most favorable to consistent training, the men are the most willing lot ever gathered there, and although no very remarkable speed has been made, the times have proven faster for this time of the year than ever before. The closing mile of a five-mile ride was made by McFarland, Stevens and Cooper in 1:59, the closing two-thirds by McFarland and Stevens several times in from 1:19 to 1:20, and the closing lap in :38, by both McFarland and Stevens, while Kiser, Cooper, Kimble and Downing have hit it at :40 several times. The men do no sprinting at all, unless this fast lap may be called so. They dress in four or five suits of training clothes, covering every part of the body, and the heavy clothing aids them in reducing flesh. Kimble has come down to 163, which is twenty pounds lighter than he rode last year. McFarland has reduced twelve pounds and is now at 180. He expects to go down to 172. Kiser has taken off five pounds and is at 161, but Cooper has added three pounds by all his hard work, now being at 160. Hardy Downing, the San Jose ranch owner, is staying with the fast bunch. By May 1 the men hope to be able to take off the heavy clothing. They will then appear for the first time in light racing suits, and the sprint work will be started. This starts the putting on of the finishing touches and all of the men expect to go seconds faster than ever before.

In the slow bunch are Mertens, the ex-five-mile champion; Horace Pouch, a local rider; George Dupre, another local man; Jerry Woodward, of Detroit, who, although lazy, is considered a likely man, and Charles Porter, the only L. A. W. supporter at the track. Mertens is doing unpaced work in the early mornings on the road and from ten to fifteen miles twice daily, unpaced, on the track. He is working hard to reduce flesh and hopes to be able to join the fast brigade this week. In this fast bunch McFarland and Stevens are head and shoulders over their fellows because they have had an entire month of hard work in California. Downing is very close to them, although he is unable to stay with the bunch to the finish as yet. Cooper and Kiser are going better than ever before. All of the men expect to leave early in May for Washington to join Bald, Zimmerman, Fournier and the eastern party, which is training there. Headquarters for May will be established at the Park Bicycle Club track and a trip will be taken to New York for the opening of the season at Ambrose Park May 20. After the Newark meet of May 21 the men will return to Washington for the great Jubilee Meet of May 24 and all will scatter for May 30

# CYCLE AGE ADVERTISES

Vol. XXII. No. 26.

THE CYCLE AGE OFFICE.

April 27, 1899.

## If You Have Not Yet Ordered "Modern Cycle Repairs"

It may interest you to know what repairmen and the trade press have to say about it:—

"Modern Cycle Repairs," is the title of a handsomely bound volume of 130 pages, published by the Cycle Age Company, of Chicago. The book is well printed and contains a large number of illustrated descriptions of economical methods for repairing bicycles and their equipment. It is a work which will prove of incalculable value to the trade. As stated in the preface, the purpose of this book is to aid the practical bicycle repairman to make his business profitable, and even a cursory glance through the book will suffice to prove that it is well calculated to realize the intent of its publishers. The chapter on repairs is especially worthy the careful perusal of every reader of this volume.—The Age of Steel.

The Cycle Age, Chicago, are publishers of Modern Cycle Repairs, a 130-page volume, whose get-up is certainly a pleasing innovation in literature of a strictly technical character. The small cuts with which the book is copiously illustrated all appear in the wide edition de luxe margin, not only giving the book a very dainty dress, but enabling one by rapidly thumbing the leaves to find any desired illustration in a second's time. The dominant chord in this book is practical usage, theorizing being treated with scant ceremony.

The subject is treated so thoroughly and the book is so saturated with technical drawings that any clever mechanic can gain a comprehensive knowledge of mending bi-

cycles from its perusal.—The American Artisan.

I have received copy of Modern Cycle Repairs. Anyone with bicycle repair business will find it is worth many times the price before the season is over. C. W. Ward, Caneadea, N. Y.

I am greatly pleased with the "Modern Cycle Repairs," which I received recently. I find it a complete and very desirable help to repairers. H. J. Loden, Anderson, I. T.

I consider the Cycle Age the best of its kind.—Thos. P. Bayer, Lansingborough, N. Y.

### EXTRAORDINARY ENDORSEMENT

An Advertiser Who Knows Cycle Age's Value and Doesn't Hesitate to Say So.

Messrs. F. S. Waters & Co. are occasional users of The Cycle Age as an advertising medium. They have written, absolutely without solicitation or suggestion, about the strongest endorsement of its value the paper has ever received. Their letter is as follows:

Chicago, April 18.—The Cycle Age Co. Gentlemen: We have just received an order for shipment of 20 bicycles from a large jobbing house in South Africa, this order coming to us through our ad. which we have been running in The Cycle Age, and we must say we are very much pleased with the results we have received from your paper the past two seasons. We have been receiving a number of orders from people both abroad and in Canada through your paper, and the wheels we are shipping to these parties are our best model three-crown, eccentric hanger. They say they want nothing but the finest goods.

Trusting this information will be of benefit to you, we are, very truly yours,  
F. S. WATERS CO.

### Satisfied Advertisers

*The amount of inquiry through your paper has been very great.*

*We are behind in our orders.*

ST. LOUIS GASOLINE  
MOTOR CO.

### Case Hardening Conundrum.

Thanks are extended to W. F. Calt, of Walla Walla, Wash.; James Slack, of New Knoxville, Ohio, and to C. L. Howe, of Portland, Ore., for further communications relative to a cheap and quick method of case hardening for repairmen. Unfortunately, they throw no new light on the subject, however.

### Queer Advertisements.

Curiously worded advertisements, which are funny without intent, are common in the London papers, it would seem. One paper recently offered a prize for the best collection of announcements, and the following is the result:

"Annual sale now on. Don't go elsewhere to be cheated—come in here."

"A lady wants to sell her piano, as she is going abroad in a strong iron frame."

"For Sale—A pianoforte, the property of a musician with carved legs."

"Wanted—A room for two gentlemen about 30 feet long and 20 feet broad."

"Lost—A collie dog by a man on Saturday evening answering to Jim with a brass collar round his neck and muzzle."

"Wanted—By a respectable girl, her passage to New York; willing to take care of children and a good sailor."

"Mr. Brown, furrier, begs to announce that he will make up gowns, capes, etc., for ladies out of their own skins."

"Wanted—An organist and a boy to blow the same."

"Wanted—A boy to be partly outside and partly behind the counter."

"To be disposed of, a small phaeton, the property of a gentleman with a movable headpiece as good as new."

## The Cycle Age Motor Vehicle Supplement

The first of the Cycle Age monthly supplements, devoted to the motor vehicle industry, will appear with the next issue.

to a number of meets promoted under the N. C. A.

Tom Eck has his party at Hot Springs. Johnson, McCarthy, McLeod, Davidson and Bennie Munroe are among the men under Eck who will star this season.

During their stay here the riders have been approached from one quarter and another regarding returning to the League. Offers to McFarland and Stevens were made through a cousin in Iowa. Kimble has been tempted, but sticks with his fellows. He had an offer of a match race at Philadelphia against Freeman, who is reported also to have wavered, but who wrote to Downing today that he would join him here May 15 and team it with him this season under the management of Charles Ward, who is expected to join the party here with his new star, Gibson.

#### The N. C. A. Amateur Rule.

The following amateur rule has been promulgated by the N. C. A. board of control:

An amateur is one who has never competed in, nor assisted in, and who has not taught any athletic exercise for money or other remuneration; nor knowingly competed with or against a professional for a prize of any description; nor sold or pledged any prize or token obtained through connection with cycle racing (this clause is not retroactive) or whose membership in any cycling or athletic organization is of no pecuniary benefit to him whatever, directly or indirectly, except such as is hereinafter provided for in these rules; or who, having transgressed any of the foregoing provisions, has been duly reinstated.

For this class of riders prizes are limited to \$35 in value for a first, unless a permit to exceed this amount shall be granted by the board of control.

It is not intended that this rule shall apply to persons who may instruct others in cycling for the purpose of effecting the sale of a bicycle; nor to those who serve as officials of the N. C. A. or at races conducted under its permits.

The following rules in reference to inter-club and team competition have an important bearing on the amateur rule above quoted:

1. Riders must be members of a club for at least thirty days before being allowed to compete under its colors; riders who have competed under the colors of a club cannot compete under the colors of another club until a period of at least three months has elapsed, unless their original club should be disbanded or go out of existence.

2. A club desiring to enter a rider or team in an inter-club or team competition at a meet in the territory governed by this association may be allowed to pay the traveling, hotel, and entry fee expenses of such rider or team upon application to the member of the board of control in charge of the district in which the club is located.

3. Any club desiring to establish a "racing membership," whereby riders competing under its colors may be granted privileges, will be given permission to do so, if such privileges are restricted to the remission of dues, the use of the club's trainer or trainers, and the payment of entry fees for inter-club or team events only.

4. Riders representing clubs in national and state championships may have traveling, hotel, and entry fee expenses paid by their clubs without application to the board of control.

#### Pennsylvania Road Bill Defeated.

Philadelphia, April 24. — After having successfully passed the Pennsylvania senate and reached third reading in the house, the "compromise" road bill, a substitute for the Hamilton measure, was defeated by a vote of 78 to 71. The city members were generally favorable to its passage, but the farmers, to whom good roads would be more beneficial than to any other class of citizens, brought about its downfall. As the legislature meets biennially, Pennsylvania will be compelled to worry along under the present inadequate system for at least two more years.

The Williamsport wheelmen will be the first to take advantage of the side-path law recently passed by the state legislature. There are, it is estimated, 7,500

wheelmen in the county, and with the \$7,500 which would be annually raised by taxing their bicycles \$1 each, much can be done toward providing the county with a network of bicycle paths within a few years which will make that section a Mecca for wheelmen from all sections of the state and country.

#### Bonhours-Walters Team Wins.

A large crowd of spectators was attracted to the Parc des Princes track, in Paris, on April 10, by the announcement that Bouhours and Walters, respectively middle distance champions of France and England, would be team mates in the fifty-kilometer paced tandem race. Four teams took part in the event, paced by eight electric tandems. At the start Champion and Digeon took the lead and gained 100 meters, Bouhours and Walters bringing up the rear. In the twelfth kilometer an accident occurred to the tandem pacing Champion and Digeon and they lost 200 meters, but a new motorcycle was put in and in the next two laps they were pulled into the lead again. Another accident in the twenty-first kilometer put them out of the race for good, however, and then Bouhours and Walters went to the front and steadily increased their lead until at the end of the thirty-one miles they were 1,000 meters ahead of the Fossier brothers, who finished second. The time was 57 minutes, or a little more than 1:50 per mile.

#### Woodside Park Re-opened.

Woodside Park track in Philadelphia was opened for the season last Saturday. Manager Wiese says that a number of improvements have been made which will result in the famous oval being faster even than last year, when Major Taylor brought to it every short-distance record worth riding for. Among those who will get into condition there are Kimble, Taylor, Freeman, Aker and other prominent riders of National circuit fame in addition to all the local "pros." and "pures" of note.

#### The N. C. A. Incorporated.

The National Cycling Association, organized to conduct bicycle races in opposition to the L. A. W., was incorporated under the laws of New Jersey, at Trenton last Friday. The new incorporation is capitalized at \$2,000. The incorporators are: Charles P. Biomecke, Newark, N. J.; Nate Salisbury and Frederick B. House, Jersey City, N. J.; John D. Lasley, Washington, D. C., and Amos Batchelder, New York city.

#### Gimm to Return Home Soon.

Louis Gimm is recovering health in the San Francisco hospital and hopes to return to his Pittsburg home in time to see the races scheduled for May 30.

Several European countries are already asking the privilege of organizing the world's championships in 1891. Switzerland, Norway and Scotland have made application, but it seems likely that the privilege will be awarded to Switzerland.

The people of South America are great lovers of races, says Momo, the Italian racing man, who returned to his native land from a tour of that continent recently, but the promoters give such poor prizes that it does not pay to ride there.

Cycling is becoming very popular in Cairo, Egypt, notwithstanding that riding there is very difficult because of the many children, dogs and other animals

which run in the streets. Wheelmen there are circulating a petition asking that certain rules for riding be promulgated.

#### NEWS IN BRIEF.

The Indianapolis Cycle Board of Trade will give the annual Memorial day road race this year.

President Keenan, of the L. A. W., has appointed William B. Curtis as A. A. U. representative on the racing board, and Fred Gerlach as representative to the International Cyclists' Association.

It is reported that the authorities of Union township, Missaukee county, Mich., have passed an extraordinary ordinance which prohibits bicyclists from riding on any of the roads in the township.

A. J. Henley, a C. R. C. veteran of Kansas City, rode a century over a hilly course in Jackson county, in 10:40:00 without handle bars. He had frequent falls owing to ruts and a high wind. Henley holds all the state records from 50 to 100 miles.

Henry Fournier and Arthur Zimmerman will train together at Freehold, N. J., for the present and later at Ambrose Park, where they will be joined by Harry Elkes. Fournier and "Jimmy" will train for sprint racing. Fournier's infernal machine is being altered and a new one with increased horse-power is being built in Zimmerman's factory.

The appointment of "Pop" Brewster, president of the Philadelphia Cycle Board of Trade, as a member of the N. C. A. board of control was without his consent, for he positively stated last Saturday that he will not accept the honor thrust upon him, as his sympathies are with the L. A. W., which organization he faithfully served in responsible positions in past years.

So good has trade been this spring that it now looks as if nearly every maker in Chicago would respond to the request of the Associated Cycling Clubs for prizes for the Decoration day road race. The prize committee is at work early and their requests have received favorable consideration. It looks as if there would be nearly twenty single machines and several tandems to top the list.

Washington and its fine third mile track have received favorable mention of late as a possible training ground for the sprinters during the month of May. The third mile track of the Park Bicycle Club is fast and the weather in the Capitol City is as favorable at the present time as at any place each year, believing that malaria results toward a more northerly training quarters from working too far south.

The new touring department of the League of American Wheelmen is already in receipt of hundreds of applications from League members for routes in various parts of the country. A large force is at work in the Boston headquarters of the department getting the necessary information properly filed, and the opening of the riding season will see it ready to answer any and all questions respecting touring a wheel in this country and Europe.

An innovation which will meet with hearty approval on all sides will be introduced by the National Cycling Association. Classes which were so altered during the regime of multicycle pacing will be abolished and an entirely new classification of the riders will be made upon the times made in final events only. In the past the winner's time in a heat has been used in the classification and a number of riders have been dropped from class after class solely on their times made in heats before they had won a prize in the lower classes. Another alteration in the manner of conducting affairs is that official timers will be appointed whose watch without confirmation will be taken as official time in a contest.

E. C. Bald, who has been in New York city for several weeks negotiating with A. G. Spalding & Bros., has contracted to ride a Spalding bicycle in all his races this season and will be the star of a Spalding team to be put on the circuit. Bald is in excellent health, and his preliminary training demonstrates that the speed for which he is noted has not left him. He has done some work on the road and has taken a few turns at Berkeley Oval, where his sprinting has given him confidence in what he expects to do this year. Last year Bald neglected the circuit to a considerable extent to ride in match races and he scored victories over the best of riders, while in competitions on the circuit he proved himself invincible. Bald has decided to make New York city his home and he will do most of his training in this vicinity. For the present, his work will consist of plenty of road work.

AS WE HAVE SAID BEFORE

# We Sell Everything for Bicycle Builders and Dealers

WHEN YOU REALIZE THAT—YOUR BANK ACCOUNT CAN BE INCREASED MANY \$

IF YOU FIGURE THE SAME WAY YOU WILL BE THE GAINER, FOR QUALITY EVENTUALLY SELLS QUANTITY WHICH MEANS  $q + q = \$$

Our stock comprises only the best of EVERYTHING. We carry nothing except that which can successfully carry out our guarantee and back up our reputation.

You should be with us on Tires, Cements, Fittings, Parts of all kinds, Rims, Spokes, Washers, Frames, Forks, Tubing, Bolts, Nuts, Sundries—in fact, EVERYTHING. Get our catalogue.

## RETAIL MISCELLANY

### General Information Concerning Cycle Agents and Repairmen Throughout the Country

#### Alabama.

Huntsville.—J. A. Bell & Co. have opened a bicycle repair shop in the Lowe building on Madison street. High grade bicycles will be kept for rent.

#### Connecticut.

Falls Village.—Darling Bros. have rented F. M. Olin's store and opened a bicycle store and repair shop.

Greenwich.—James F. Lally, who has been in Ray & Son's hardware store for some years, has joined C. J. Ferris in the bicycle business, and hereafter the firm of Ferris & Lally will conduct the bicycle store in the News building.

Naugatuck.—J. R. Murphy has opened a bicycle store in the Dayton block on Water street.

Norwich.—R. Beckwith has opened a bicycle store in the rooms formerly occupied by Hale & Kelsey.

#### Illinois.

Aurora.—Frank Anderson and Oscar Grafton, two skilled employes of the Aurora Automatic Machinery Works, have opened a bicycle supply store and repair shop at 4 Downer Place.

Freeport.—W. C. Schouer, of the Brown & Schouer implement house, has taken the agency for the Thomas bicycles.

Kansas.—John Ruppert is arranging to reopen his bicycle shop.

La Prairie.—J. C. Hogsett, proprietor of a general store carrying agricultural implements and bicycles, has taken a partner. The firm is now Hogsett & Ross.

Ottawa.—Armstrong & Mathewson have opened a bicycle store at 110 Madison street.

Rossville.—Chas. W. Meneley has opened a bicycle establishment in the Crane building, where he will do a general bicycle business and carry bicycle sundries and repairs in connection with a general plumbing business.

Waukegan.—T. F. Wheeler has a branch bicycle shop in Lake Forest, having purchased C. R. Mills' old established stand.

Woodstock.—C. F. Dacy has moved his office into his new building just completed, where he will be found with his usual high-grade bicycles.

#### Indiana.

Indianapolis.—Christian Eby and John Thompson of 154 North Delaware street have formed a partnership under the name of the Indiana Supply Co. They are general agents for Old Hickory bicycles and Julius Andrae & Sons' line of cycles and supplies. Pianos, organs and sewing machines are also handled by this firm. Mr. Eby manages the business, while Mr. Thompson is on the road in the interest of Old Hickory bicycles.

#### Iowa.

Cedar Rapids.—Hruby & Pavlis, hardware and bicycle dealers, have filed dissolution papers.

Minden.—William McEndee & Co., dealers in hardware, etc., have been burned out.

West Union.—George Mears has opened a very neat bicycle repair and supply shop.

#### Kansas.

Claffin.—G. N. Moses has sold his interest in the Claffin Hardware & Implement Co., which handles bicycles as a side line.

Great Bend.—G. N. Moses has sold his interest in the firm of G. N. & E. R. Moses. The E. R. Moses Mercantile Co. succeeds.

Hanover.—Wm. E. Kornbaum will carry on the business of the firm formerly known as Kornbaum & Mullegan.

#### Maine.

Bath.—Nick McGilvray, the polo player, will open a bicycle repair shop.

Gulford.—Clarence Weymouth has opened his bicycle repair shop on South Main street. Quite a stock of machines is already on hand to be cleaned and repaired.

Orono.—Fred Park has added a bicycle repairing department to his store and is already doing quite a business.

#### Maryland.

Annapolis.—The business known as the Annapolis Bicycle Agency, for many years conducted by J. F. Abbott, has been purchased by Edwin B. Smith, a promising

young business man of Annapolis. The new management will make some improvements to the store and will represent the Crawford, Crescent, Cleveland and other standard machines. A fully equipped repair shop has been added to the agency.

#### Massachusetts.

Barre.—C. N. Cowan has opened his bicycle rooms for the season with a carefully selected line of bicycles and sundries.

Salem.—James F. Almy, of the firm of Almy, Bigelow & Washburn, is dead.

Stoughton.—Chapman & Sons are to open a new bicycle store in the Stretton building. The Chapman factory is running at full capacity, having orders enough to keep it busy well in to the season.

#### Michigan.

Bay City.—Annis & Adams, both practical bicycle men, have opened a repair shop in the Primm block. They intend to handle the latest and best bicycles and supplies made and will do expert repairing on short notice.

Delray.—Charles and Burt Reinhart will soon open their bicycle repair shop on Fort street. Enameling will be a specialty.

Grand Rapids.—The Tiger bicycle people have displayed in their window a magnificent tiger head carved out of a solid piece of wood. It is framed in a bicycle rim and is a striking advertisement for the bicycles which the agency handles.

Grand Rapids.—Harry Rablin and Eugene Miller have rented a building and opened a shop for the repairing of bicycles. It is their purpose to handle several different grades and makes in bicycles.

Lowell.—Clark & Clark, dealers in hardware and bicycles, have dissolved partnership.

Pontiac.—Herman B. Seagrave has sold out his hardware business.

Port Jervis.—Frank Bond, bicycle agent in the Opera House block, has been so rushed with work that he has been forced to secure the services of C. H. Custis, a practical repairer, who has had six years' experience in the works of the John P. Lovell Arms Co. and who for the last three years has run a bicycle shop in Milford.

Sault Sainte Marie.—A. E. Runnels has opened his Portage avenue bicycle livery. He has just received a line of new bicycles, both for sale and for rent, and also offers his old machines for sale at a bargain.

Ypsilanti.—Harding & Shaefer have gone out of business.

#### Minnesota.

Glencoe.—W. G. Gould is building a bicycle emporium on Hennepin avenue.

St. Paul.—The Northwestern Cycle Co. has opened a store in the Grand Opera House block.

#### Missouri.

Albany.—Peery & Pierce, dealers in harness, bicycles, etc., have dissolved partnership.

Perry.—Mr. Moore has sold his interest in the hardware business of Sterrett & Moore. The new firm is Sterrett & Moss.

#### Montana.

Helena.—Weinstein & Co., proprietors of a general store handling bicycles and sundries, will incorporate.

#### New Hampshire.

Dover.—H. W. Hartman of Salem, O., will open a bicycle store.

Lancaster.—Fred Stebbins has bought out the bicycle repairing business of W. L. Rowell, Jr., and is doing a good business.

#### New York.

Attica.—Mr. Moritz has retired from the hardware firm of Ballsmith & Moritz. A new partnership has been formed under the name of Ballsmith & Pilgrim.

Cherry Creek.—Masons are putting the foundation under the building to be used by Boller Brothers in their bicycle business.

Dunkirk.—Spencer, Lord & Co. is the name of a new bicycle house in this city.

Olean.—W. D. Newerf, representing the Gormully & Jeffery Mfg. Co. of Chicago, has taken charge of the new bicycle store in the Masonic building. The firm will show a complete line of Rambler machines.

Penn Yan.—Ward Ellis, a bicycle repairer, has been burned out. He places his individual loss at about \$800, with no insurance. There were also in his shop bicycles for repairs belonging to different parties, which he estimates as valued at another \$800.

Port Jervis.—George M. Decker has opened a bicycle store in the Lockwood building. He has a line of first-class machines for sale and is well stocked with bicycle supplies for repairs.

#### North Dakota.

Grand Forks.—Barnes & Nuss are remodeling their hardware store on Third street and are adding a new stock of hardware. They are also exhibiting a fine line of bicycles. The firm has in connection one of the most complete repair shops in this section.

#### Ohio.

Dayton.—R. Harry Croninger succeeds the Croninger Cycle Co.

New Lexington.—The hardware firms of Acker, Rose & Ward and S. McGirr have consolidated under the name of McGirr, Wood & Co.

Salem.—H. W. Hartman, who has been running A. M. Carr & Son's bicycle repair shop, has left for Dover, N. H., where he will be in charge of a large bicycle repair shop.

Salina.—V. & H. Schmitt have opened a general bicycle repair shop on West Fayette street. They thoroughly understand their work and can put a bicycle in excellent trim.

#### Pennsylvania.

Altoona.—The Altoona Cycle Co. has opened for business at 1426 Eleventh avenue. William Shaar is the proprietor.

Pittsburg.—Albert Hofer, who is conducting the bicycle business of Louis Gimm, the Pittsburg rider who is ill in San Francisco, has had news that Gimm is on the road to health and hopes to be home in time to see the races scheduled for May 30.

#### Rhode Island.

Westerly.—Albert Pilling, formerly bookkeeper for the Smith Granite Co., has purchased the bicycle business of the Stilman Carriage Co. and will conduct it hereafter at the same location on Coggswell street.

#### Texas.

Sherman.—B. L. H. Wright has sold his hardware business to E. E. Flippen.

#### Wisconsin.

Chill.—Gus. Bulgrin has decided to go into the bicycle business. With him will be associated M. L. Link, and together they will handle high grade bicycles, do repairing and carry supplies of all kinds.

La Crosse.—C. A. Krebaum has opened a bicycle store in this city.

Milwaukee.—The bicycle repair shop of George Schmidt, 785 Twelfth street, has been slightly damaged by fire. Mr. Schmidt believes the blaze was of incendiary origin.

Oshkosh.—A one horse power motor is about to be placed in H. F. Werner's bicycle repair shop.

#### On Tooting Bazoos.

Perhaps the author of the following advertisement, which is strikingly incomplete, consoles himself with the reflection that it is better to be laughed at than neglected:

#### SOME PEOPLE TOOT THEIR BAZOOS

When there is really no justification for doing so. But when we tell you that we have just received our invoices for twenty-seven new bicycles comprising the following:

#### Columbia, Hartford, Ideal, Orient, Rambler

Bring in your bicycles early and have them enameled and repaired, and avoid the rush.

#### W. H. MITCHELL,

Dealer in Hardware, Stoves, Tinware,  
Paints and Oils,

116 E. Brown St. 'Phone No. 184.

The inference is clear—some people toot their bazoos.

# INFORMATION FOR BUYERS

## SPALDING TO BUILD IMMENSE PLANT.

It is reported that A. G. Spalding & Bros. will begin the erection of an extensive manufacturing plant in West Harvey, just south of Chicago on the Calumet river, on a tract of 700 acres owned or controlled by the firm. This plant will cost about \$250,000 and will be occupied by the various bicycle, sporting goods and other manufacturing industries at present operated or controlled by the Spaldings in various towns of New York, New Jersey and Massachusetts. The saddle concern of H. A. Christy & Co. of Jackson, Mich., has already begun to remove to Harvey close to the site of the factories to be built, having shipped several carloads of material to Harvey and commenced moving it into temporary quarters.

The land has been leased from the American Trust & Savings bank, trustees, and \$600,000 worth of 6 percent bonds issued and partly placed. Rough plans of the buildings are now in the hands of A. G. Spalding, who is holding them back for some reason known only to himself but believed to be connected with the proposed bicycle consolidation.

Mr. Spalding is quoted as saying that when his plans are completed it will mean the doubling of Harvey's present working force, which is something over 2,000 persons. The general impression among manufacturing circles in Harvey is that work on excavations for the new factories will commence within thirty days.

## THE SOLITAIRE GAS LAMP.

Sanford & Pollow, 235 Lake street, Chicago, are more than satisfied with the reception that is being accorded their little 8-ounce Solitaire gas lamp by the trade. The lamp, an exterior view of which is shown herewith, though it is much smaller than the

average acetylene lamp is said to give a strong white light for five hours and to answer all the requirements in this form of cycle lantern. The construction is exceedingly simple, little chance being allowed for the working parts to get out of order. The water reservoir is back of the reflector and the connection between it and the carbide cup is through a needle drip valve. The water, however, does not drop directly upon the carbide but first passes through a blotting paper held near the top of the carbide chamber and separated from the lower side of the water reservoir by a wire screen. Thus the water drips upon the upper surface of the blotter and spreads over the greater portion of its area before soaking through and dropping upon the carbide below. This feature aids in the uniform distribution of the water. The flame and gas pressure are regulated by the water valve. The gas passes to the combustion chamber through an outlet commencing at the bottom of the cup below the carbide holder and so does not have to pass through wet carbide but reaches the burner dry. Any form of carbide may be used. Each lamp is furnished with a combination bracket which may be fastened either to steering head or fork side.

## SUPPLIES ANY KIND OF CYCLE PART.

The Cycle Repairs Co., 56 Fifth avenue, Chicago, has been organized for the purpose of supplying to repairers, dealers and others, parts of all descriptions to match broken and worn pieces from bicycles no longer manufactured or for which fittings cannot be readily purchased. The company is composed of resourceful cycle experts who will be able to duplicate any part or parts which may be needed by patrons and who will never reject an order no matter how diffi-

cult it may be to procure or to manufacture fittings for which a call is made. The firm will also keep in stock a full line of frames, wheels, forks, handle bars, tires, chains, hubs, rims, standard cups and cones and other materials and fittings used by dealers, repair men and small manufacturers. Prices on all goods and work will be reasonable, and satisfactory filling of orders is guaranteed. Nickeling, enameling, vulcanizing and general repair work are also included in the range of the company's business.

A specialty is being made of the Columbia single tube tire which is fully guaranteed and yet sold at a price that places it in competition as far as cost is concerned with many of the cheap unguaranteed tires now on the market.

## AUTOMATIC LIGHTER FOR CYCLISTS.

The Rathbun Mfg. Co., 11 Blue Island avenue, Chicago, is general United States selling agent for the automatic lighter shown

THE CYCLE AGE

in the accompanying illustration and which is intended for use by cyclists, smokers and others who often desire to strike a light in the wind. The holder, which is nicely nickelled and so thin that it can be conveniently carried in the pocket, carries a series of fuses. By pushing the ejecting fork quickly forward with the thumb a section of the fuse is pulled from the case and is ignited as it moves. The flame thus caused will not blow out in the wind. As soon as the fuse section has been burned out the ejector may be drawn back and the lighter is ready for use another time. Each holder is accompanied by sufficient fuses for 200 lights and additional charges may be purchased at very reasonable rates.

## HANSON NAMEPLATE CATALOGUE.

C. H. Hanson, 40 Clark street, Chicago, who is well known throughout the trade as one of the oldest nameplate manufacturers in the country, has recently issued a catalogue showing full size nameplate designs of patterns which are carried in stock and which can be filled out with name, etc., to suit the purchaser on short notice and in lots of all sizes. Many choices of finishes and styles of lettering are offered. The exterior of the catalogue presents an original idea in the form of a regular metal nameplate bearing the maker's name and address secured to the front cover. The plate is of tasty design and is finished in Mr. Hanson's new royal blue finish.

## ASHWORTH ADJUSTABLE TOE CLIP.

L. T. Snow, manufacturer of hardware specialties, in New Haven, Conn., is offering to the trade the Ashworth patent toe clip, new this season. It is a wire clip of

the basket variety and formed of a single piece of wire, as shown herewith. It is tasty in appearance and so constructed that the sides are elastic, which it is claimed makes it fit comfortably and allows the foot to be easily withdrawn in case of a fall. The adjustment is made when the clip is on the pedal, without loosening a screw or clamp, by merely spreading or contracting the toe of the clip. A free sample is offered to any reputable agent or dealer who applies for one.

## NEW BESLEY MATERIALS CATALOGUE.

The new catalogue of Chas. H. Besley & Co., 10 North Canal street, Chicago, will be ready for delivery May 1 and will thereafter

be sent postpaid to any address upon application. The company calls especial attention to the revised list on all metals catalogued and to the fact that all lists have been corrected to agree with the present market conditions, the quotations being compiled exclusively from manufacturers' lists. Among recent additions to the Besley line of materials and tools are the Badger die stock set, Besley adjustable tap wrench, new Brown & Sharpe and Starret machinists' tools, improved laboratory specialties, Gardner grinders, Tanite grinding machines and emery wheels, Pecora machinery points and various other articles and lines of recent introduction to the machinery market.

## NAME CHANGED TO LIBERTY BELL CO.

The Bristol Bell Co., of Bristol, Conn., well known manufacturers of Peerless, Corbin and Standard bicycle bells, has changed its name to The Liberty Bell Co., without, however, having made any change of management or ownership.

This company is bringing out a new line of high grade bells to be known as the Liberty bell, while at the same time continuing to manufacture the other lines of bells already manufactured by the Bristol Bell Co.

The new name is announced at this time in order that the trade may become familiar with it before another season opens.

## STEARNS' TRIM SEAT CLUSTER.

H. L. Trebert, of Syracuse, has patented for E. C. Stearns & Co. the system of making tube joints—especially upper rear stay connections—as shown in the accompanying illustration. The construction of the joint is described as follows: The upper end of one of the fork sides or stays is compressed inwardly or cut out, so as to form a seat

THE CYCLE AGE

fitted to receive the upper end of the other fork side. Into the rear face of the upper end of the upright is then drilled an aperture of proper size and at a proper angle snugly to receive these upper ends. They are then inserted together, brazed in position, and the upright is milled out on its interior, cutting away portions of the fork sides to receive the seat-post. It will be seen that in cutting the aperture to receive together the upper ends of the fork sides the upright must be drilled at two different angles corresponding each to the angle of outward and downward inclination of one of the fork sides. The result of this is a peculiar double hole, in cutting which a considerable surface of contact is formed in the interior of the upright and shoulders for receiving the ends of the fork sides. The joint so formed is strong, simple, and easy to construct. It is a flush joint without any unsightly projections—such as thimbles, ears, lugs, and bolts—but at the same time easy to braze, there being none of the objectionable interior brazing; but this is all practically on the exterior, so that there is little possibility of careless work and imperfect brazing.

## JACKSON'S COASTER AND BRAKE

The Jackson automatic coaster and brake, partly shown in the accompanying illustration, is a combination of a roller-clutch-mounted rear sprocket with a band brake, which presents a very neat and original method for enabling the rider to stop his wheel in emergencies, slow up without effort and coast with the feet on the pedals when desired. The whole device is designed to be attached to any ordinary bicycle hub by screwing it onto the hub-end as sprocket wheels are usually screwed on, space being provided for a locking-ring within the

# Kozy Baby Seat!

LIGHT, SAFE, COMFORTABLE.

Do you carry them in stock? You can not afford to be without it. Ask your Jobber or obtain them direct. Sell quickly at \$2.00.

GEO. HILSENDEGEN, Detroit, Mich.

brake flange. The latter is surrounded with the band brake box, the square projection of which rests with a small ledge on the upper edge of the lower rear stay if this tube is D-shaped. A special attachment clip is provided for securing the box to round tubing. In either case the attachment permits readily of chain adjustment. The square projection of the band-brake box fits in between the upper and lower chain reaches and contains a trigger arrangement attached to the free end of the band. With forward pedaling the sprocket wheel passes freely past the trigger, but when the sprocket is held back the trigger immediately turns on its pivot, being pushed out by a weak spring, and the sprocket tooth engaging the trigger turns its opposite end against the inner wall of the ledge on the box as a fulcrum. If no back pressure is exerted by the rider this simply results in free action of the roller clutch, permitting the rear wheel to revolve while the chain and sprocket are at rest, but if the rider puts back pressure on the pedal the trigger is lifted around its fulcrum and the band brake contracted around the drum with a retarding force exactly in proportion to the exertion. The action of the brake may thus be made gradual or almost positive, as desired. In the roller clutch a new feature has been introduced to secure positive un-falling action. The inner edges of the sprocket hub fit snugly over the clutch, forming a groove between them in which the clutch balls are introduced through holes drilled radially through the clutch

hub. The sprocket must therefore be mounted on the clutch before the balls are introduced, but this is done in the factory and does not concern the rider. After the balls have been placed, a thin spring wire is placed in between the balls and the race and is imbedded in a groove in the bottom of the latter, entirely encircling the clutch. This wire not only serves the purpose of preventing the balls from dropping back in the holes but also acts as a spring by which the balls are always kept in rolling contact with the sprocket hub. The whole device presents an attractive proposition. It may be suggested, however, that the relations between the sprocket ring and the screw threading of the clutch hub are not identical with the corresponding relations noticed in several sprocket wheels in the Cycle Age office. If therefore the device were mounted on a machine to take the place of such sprocket wheels, a slight misalignment of the rear sprocket in relation to the front sprocket would be the result. In most models the sprocket line is fixed, and it may therefore be necessary in some instances to provide a slight modification of the design of this device to make the chain run sweetly. When made specially for each style of popular hubs the device should command a very ready sale. The makers are the Jackson Coaster & Brake Company of Jackson, Mich.

### GENEVA CYCLE CO. INDUSTRIOUS.

More than 8,000 bicycles have been shipped since January 1 by the Geneva Cycle Co. of

Geneva, O., whose plant has been running every day of the past winter with increased facilities. More than \$80,000 was paid out in wages by this company last year.

### THE "FAMOUS" CHAIN GUARD.

The Excelsior Supply Co., 88-90 Lake street, Chicago, has recently placed in the market a steel chain guard of attractive design and moderate price. The fitting is made of hard rolled steel, heavily nicked and provided with light-weight attaching braces of sheet metal. A strip of felt is cemented to the

part that covers the top run of the chain, preventing any rattle from contact of the chain with the guard.

### AN UNFOUNDED REPORT.

Owing to an incorrect newspaper report, a story has gained wide circulation to the effect that the Pope Mfg. Co. discharged a number of its employes about Easter time. The statement is entirely unfounded. As a matter of fact, the Pope company has been constantly adding to its force for several months past, and is at the present time employing more men than ever before in its history. Every department of the company's immense factories is working overtime, and the full capacity of the plant is being taxed to meet the demand for the new Columbias, Hartfords and Vedettes. More than 3,800 names are now on the weekly pay roll.

### FEATHERSTONE CRANK AXLES.

The object of the construction illustrated, for which patent has been issued to A. Jerome and assigned to A. Featherstone & Co., Chicago, is to provide a crank hanger mechanism which may be readily separated

and substantially put together without any chance of mistakes. The construction is incorporated in the output of the Featherstone company in its latest models and is therefore so well known to the trade that the illustrations afford all the description necessary. The characteristic feature is that one simple tool, as illustrated, suffices for performing every operation in assembling and taking down of the mechanism, making

all hammering or wrenching to disengage parts wholly unnecessary.

### STICK TO GOOD THINGS.

When a progressive manufacturer clings to an expensive patented device through the numberless changes of many successive seasons, its value must be unquestioned. The Wolff-American people of New York city have thus retained their eccentric chain adjustment and their system of self-oiling bearings. A system would not be a system, but only a scheme, if it did not "work."

The Salamander, or ruby, finish of Wolff-American bicycles must be expensive, but it is beautiful. The frame goes through successive processes of nickel plating, polishing and transparent enameling. It comes out as translucent as red wine.

### NOVEL REPAIR PATCH.

J. E. Bancroft of Toledo has devised the novel repair patch herewith illustrated and assigned the patent to the National Cement

& Rubber Co., of Toledo. The patch is reinforced by fabric imbedded in the vulcanized rubber disk and the latter has a pocket in its face designed to hold raw rubber stock. The pocket is largest at the bottom so as to hold the raw rubber securely, and a string passes through the rubber.

### CHANGE OF PACIFIC COAST AGENCY.

The Elastic Tip Co., of Boston, which has been represented for years on the Pacific coast by the Robert Malcom Co., of San Francisco, has transferred its representation in that territory to John E. Klein & Co., 114 Eddy street, San Francisco. Dealers buying from the last named house will be accorded the same attention heretofore extended the trade by the Robert Malcom Co. In addition to a full line of bicycle materials, fittings and sundries, the new agents will carry a choicely selected stock of guns, fishing tackle and general sporting goods and also built-up bicycles.

The Miami Cycle & Mfg. Co. of Middleton, O., has decided to build a factory in Ontario, Can., for the manufacture of the Racycle.

# TRIBUNE BICYCLES

Preparations for 1899.

The accompanying illustration shows the large addition to our plant now in process of construction. The building is 100 feet by 50 feet, three stories high, constructed of brick, stone and iron, the floors only being wood. It will be devoted exclusively to enameling and decorating our Tribune Bicycles, and will be one of the largest departments of its kind in the country. This is, perhaps, in itself the best evidence that could be given of the popularity of the Tribune wheels.

# Some Difference

One of the largest retail dealers in the United States writes in to say that "the difference between Patee Crest bicycles and those offered for the same money by other makers is about as striking as the difference between a Broadway tailor-made dress and a Jersey home-made gown" Only those of our readers who have left New York on a bright summer's morning to tour through Jersey can appreciate how well this simile applies.

Patee Crests are right up to the top notch in style and finish, while the quality is guaranteed to be equal to any bicycle in the world.

## Note What Some of our Agents Say:

PATEE BICYCLE CO., Peoria, Ill.:

*Gentlemen*—Your wheel this season has given the best of satisfaction, both to ourselves and the riders, and we could have easily doubled our sales if we could have had the wheels. We have been in the wheel business for the past five years, and have handled the Waverly, Sterling, Imperial, World, Hibbard and Ajax lines, so you may see that our experience is not limited to one wheel; and, with the exception of three or four tires, your wheels have given us no trouble whatever. Your wheels have been a splendid advertisement last season in this section, and we should judge that it is the same everywhere you have sent them. It is known around here as the best \$35.00 wheel on the market, and equal to any high grade. The Patee Crest has stood the test of a year, and another season it would not require the work of advertising to sell double the number of wheels that you sold last season. If you sell your wheel at \$40.00 retail it is practically placing another wheel on the market, and your labor of putting the \$35.00 wheel on the market last season would be lost. No doubt your profit at \$35.00 is small, but it seems to us that we would be contented with the smaller profit rather than to advance the price. We as retailers would rather sell your wheel next season at \$45.00 with the same profit as last season, than to sell it next season at \$40.00 at even \$5.00 more profit. We are certain that we could sell more wheels and at the end of the year would be far ahead.

However, our opinion is only one of many of your agents, and, whatever may be your decision, we shall do the best we can for Patee Crest. We kindly ask that you place us at the head of the list, and forward us the first complete sample you get out. We want an early start next season and reap some of the benefit of the good work we have done in the past.

In closing we will kindly say we are with you at all events, but with one model at \$35.00, we would be with you "with both feet." Wishing you all the success possible next season, we remain,

Yours truly, NORTHWEST GUN AND BICYCLE CO.,  
By M. C. Riley, Sec'y.

SALT LAKE CITY, UTAH, Sept. 12, 1898.

PATEE BICYCLE CO., Peoria, Ill.:

*Gentlemen*—Please don't forget that I want a '99 sample as soon as it is ready. While our sales the past season did not quite reach the 300 mark, as I thought they would when I got my first machine, it was only because you were not able to supply me. I will guarantee to sell 500 next season, as I have never handled anything that gave such universal satisfaction as the Patee Crest does.

Every rider is more than pleased with his mount, and I don't know of a single one who would trade for any other make at any price. Just keep up to your present standard and you can't make enough of them.

I am glad you are going to build 12,000 next season, but put me down now for 500 and see that I get them. Anxiously awaiting the '99 model, I am,

Yours truly, A. H. MEREDITH.

SPRINGFIELD, ILL., Sept. 9, 1898.

PATEE BICYCLE CO., Peoria, Ill.:

*Gentlemen*—I have been handling your Patee Crest bicycle all this season and find that it gives excellent satisfaction. The sales have exceeded anything I have ever handled for a new wheel. It seems to hold its own as good if not better than any of the older makes of wheels. I have sold over one hundred of them, and they are all you claim for them

as far as I can see. I can recommend it to any dealer who wants a good wheel for the price. I shall continue to handle it as long as it is made of as good material as is now used in its construction.

Yours respectfully, B. H. FERGOUSON.

WALLINGFORD, CONN., Sept. 16, 1898.

PATEE BICYCLE CO.

*Gentlemen*—Now that the season of '98 is drawing to a close, we wish to thank you for your courteous treatment of us and to say a few words of praise for the Patee Crest.

We have just completed our fifth year in the bicycle business, and in all our experience we have handled no line that has given us the satisfaction that the Patee Crest has, our only "kick" is that we did not get a sample sooner. You have, without doubt, the best wheel on the market for the money, and in our estimation, is better than many so called \$75.00 high grade wheels. The Patee Crest has not cost us one penny for repairs, and you know you have had no parts to replace. We can give you numerous testimonials from Patee Crest riders, who will attest to the easy-running qualities, durability, etc., of your wheels should you desire them.

Thanking you again for your kind treatment of us during the past, and hoping our pleasant relations will continue in '99, we beg to remain,

Yours truly, COTTRILL & SMITH.

CHAMPAIGN, ILL., Sept. 20, 1898.

PATEE BICYCLE MFG. CO., Peoria, Ill.:

*Dear Sirs*—We have received yours of the 8th, and in reply will state that we have had very good satisfaction with the Patee Crest, and think it is equal, if not superior to the majority of the \$75.00 machines. It is enough to say that it is about the only machine in the market that we have been able to sell at the list price, also to sell at the same price in September that they sold for in May which is saying considerable for any wheel. We anticipate an immense trade on it next season.

Yours very respectfully, NICOLET & Co.

NEW YORK CITY, N. Y., Sept. 10, 1898.

PATEE BICYCLE CO., Peoria, Ill.:

*Gentlemen*—We wish to express to you our entire satisfaction with the '98 Patee Crest, and ask that you give us a larger territory in '99. Your bicycle is the best we have ever handled, regardless of list. It looks well, runs well and lasts well. The only trouble we have had was in not getting them fast enough in the Spring when we could have sold two thousand in place of two hundred. Very truly yours,

NEW YORK SPORTING GOODS CO.,  
Per P. R. Robinson, President.

CHICAGO, ILL., Sept. 10, 1898.

PATEE BICYCLE CO., Peoria, Ill.:

*Gentlemen*—We take pleasure in stating that, as Chicago agents for the Patee Crest, we have found the machine to be one of the best sellers we have ever handled. We could not get them fast enough. This machine is in many ways the superior of any \$30.00 wheel on the market, and we have been unable to find anything else at \$35.00 that approached it in quality. Yours very respectfully,  
Dictated by Clyde P. Warner. CLYDE P. WARNER MFG. CO.

While others are still asleep we are shipping hundreds of 1899 Models.

If you want to get in on a "good thing," write early for catalogues and prices. We don't want many more agents and when our list is full you can't get in for love nor money.

Patee Bicycle Co., 111-113 Main St., Peoria, Ill.

# “Not how cheap, but how good”

Cheapness has never been characteristic of Cleveland Bicycles for we have always found plenty of buyers with discernment enough to know when they get their money's worth.

Our goods have never been sacrificed by Department Stores, hence we have no lost ground to regain---our record is clean.

The Cleveland Bicycle is today standard for excellence; more new and distinctive features than any other in the market.

Mention The Cycle Age

# Transfer Name-Plates for the Masses.

**N**ONE realizes the enormous demand there is for transfer name-plates for the dealer, repairman and small maker or bicycle builder. There are from twenty to twenty-five thousand that would meet under that heading, and to devise a transfer name-plate that could be sold to them at a very low price with their special wording matter or lettering, was a subject that kept us thinking a long time. We realized that in every hundred inquiries we received, not more than one or two felt that they could afford to spend fifteen or twenty cents for a special name plate and not buy more than fifty or one hundred at a time. The public is too well educated in an artistic way to accept any gold leaf design only. The result is there are eight or ten dealers in the country who would buy transfer name plates, while if they could buy them in nice colors, something artistic, for a reasonable price, there would be that many thousand who would use transfer name-plates.

We have at last devised the very best thing possible, something that we feel sure will make a big hit, and take like wild fire with the dealers as well as all makers of bicycles who buy fifty or one hundred name-plates at a time. We have just completed our '99 catalogue, and in it have illustrated four designs of those transfer name-plates, which we can sell to anyone interested, in small lots of 50, 100 or 200 at a time. As an illustration of what we ourselves have to sell, we present herewith a cut of one of the designs. The open spaces in the design are open in the transfer, and in this open space we print in gold leaf any special lettering or wording matter desired by any dealer or repairman. That is, when he wishes to sell fifty wheels of his own brand during the year, or say 100 wheels, we will make up his own lettering in the design and he can buy this name plate beautifully worked up in brilliant coloring with his own exclusive wording matter in it, and at a very low price.

Orders for name-plates can be executed in about one week. Every jobber interested in selling this line of name-plates as well as our decorations will please write us. Every dealer, small builder and repairman throughout the land will find it to his advantage to write us for samples and prices.

# Gilliam Saddles

for 1899.

MODEL NO. 57.

A road saddle for women, having a broad seat with coil springs. Padded with curled hair; base of laminated wood, the lightest material possible to use for this purpose. This saddle is designed particularly for women, but is used to a great extent by men who prefer a wider seat than is found on most saddles for men.

The above is only one of many styles. Samples of our full line are now being shown the trade by our travelers. See them and get prices before placing your saddle contract.

# What Constitutes a Good Bicycle? Why Tribunes Excel.

Last week we showed you our seat post binder from the outside, this week we have taken the small spanner wrench which accompanies each wheel, and unscrewed the round nut and slid it a little ways up the seat post, also pulled out the remainder of the binder that you may see it complete. Now that you have it all in view, we would be willing to wager a cooky that you cannot tell how it works, or what makes it bind. If you are ingenious enough to discover the principle you will see at once that it is the neatest, simplest, and most effective seat post binder that was ever put on a bicycle. For the benefit of those who have not been fortunate enough to discover all this, we will next week show the parts all separately. You can, however, end the suspense at once by sending for our new catalogue which will fully illustrate it, together with some other good things.

# JUST ONE!

**T**HE word "one" as indicating number or quantity does not mean a great many. Sometimes it is used to call attention to some particular article or thing which is different or in a distinct class by itself.

As, for example, we frequently allude to the **Cleveland** as being "The '**One**' bicycle or line of bicycles, to show improved construction for the season of 1899." In this case the word "One" adds emphasis to the statement following it.

Then again—we say "There is **one** bicycle on the '99 market which runs easier, therefore requiring less effort to propel it than others and that "**One**" is the **Cleveland** fitted with Burwell Ball and Roller Bearings." **More emphasis!**

And again—we say "The **Cleveland** is the **One** bicycle which affords the retailer a liberal margin of profit and at the same time gives the rider his money's worth in real value with a generous 'surplus' in satisfaction and comfort."

You see the little word "**One**" may not mean a **great many** but may mean **much**. Perhaps the **Cleveland** is the **One** bicycle you need to bring prosperity for the New Year.

THE SCIENTIFIC AND PRACTICAL

# BEARINGS

OF FUTURE HIGH GRADE BICYCLES.

Pat. Dec. 28, 1897.

## Why?

The Revolving Inner Sleeve—like a sidewalk that moves as one walks—increases speed. The construction—see cut—produces easy running always. No dust can enter into the bearings. The oil feeder lubricates automatically for a complete season. Only light oil used. No clogging with dirt and grease. Only one adjustment for one season. No breakage of cups and cones. Wears twice as long as ordinary tool steel bearings.

Whether speeding on the level, or “plugging” through sand and mud, or climbing hills, or racing—these bearings add 40 per cent. of ease or speed for the same expenditure of power.

# To the Jobber

That Has Not Yet Issued His '99 Catalogue.

**H**AVE you made your arrangements to job our line of transfers for the coming season? Do you know that we have our '99 line of bicycle name plates and frame decorations complete, that we furnish electro cuts to the jobbers free, that we furnish samples for traveling men to sell from, without charge, that we guarantee absolutely the quality of the goods we sell, and furthermore, that it's a nice little specialty for any jobbing house to handle, that the trade is most decidedly on the increase with the dealers and repair men? If you have not yet done so, GET IN TOUCH WITH US.

Some of the jobbers of our goods have sold upwards in the thousands of dollars' worth last year, so you see the field is not so small as it apparently might appear to the casual observer.

Our line of name plates to be sold to the dealer and repairman is in the nature of beautifully colored name plates which can be furnished with the dealer's name and address in the design; that is, they are so made that we can afford to sell them at a low rate and it is a splendid item for the jobber to handle and to catalogue. Write for Catalogue, Samples and Prices.

CLEVELAND, OHIO.

**Closed to Argument.**

Any question as to the superiority of a running gear which not only offers less resistance than another under conditions most favorable to the latter, but which is always at its highest efficiency while the other may run easily today and hard tomorrow, is closed to argument. There can be but one answer, and it is as stable as the solution of a problem in exact science. From it there can be no appeal. There are excellent chain-driven bicycles, but none of them is comparable to the Columbia Bevel-Gear Chainless, which is not only easy running, sure and speedy when circumstances are favorable, but which will carry you with equal certainty through every state of weather or road, which must of necessity run tomorrow as it runs today, and which is always completely ready to ride so far as its running parts are concerned. The superiority of this machine is demonstrated in many other ways, notably in the comparative ease with which it takes grades, in the immunity of its rider from many of the accidents which most frequently happen, and in its cleanliness, which renders precaution against soiling the clothing entirely unnecessary.

**Two New Columbias.**

The Pope Manufacturing Company has in no wise relaxed its attention to the improvement of chain-driven machines, as is very plainly evidenced by the fine points of Models 57 and 58, two new members of the Columbia family which combine every excellence that can possibly enter into the building of bicycles of their kind. Some of the Columbia features seen for the first time in these machines are worth special comment. In design the latest and most approved lines have been followed in every particular. The large (1¼-inch) main tubes, the improved flush joints, the wheel base affording room for as large sprockets as may be wished, the special cutting of the sprockets to guard against loss of power through sliding of the chain, the internal expanders at head and seat post, and the handsome finish, which includes black enameled, gold-striped rims, are improvements which must strongly appeal to every practical wheelman or wheelwoman.

**Good Qualities Everywhere.**

Very handsome in line and finish are the 1899 Hartfords. And that these machines are not lacking in the more essential qualities of durability, strength, and ease of running, is abundantly evidenced by the character of the material and workmanship which enter into their construction. For many years the Hartfords have been popular, and for many years they have had a higher place in the estimation of thousands of practical riders than many other wheels which have been sold at higher prices. The Hartford rider has the habit of remaining a Hartford rider, unless he or she discards the Hartford in favor of the Columbia.

**Something About the Forty-Nines.**

Very popular among road riders last year was the light, free-running Columbia Model 49. The same "Forty-nine" with 1899 improvements is offered again this year. Chief among the changes is the new construction at the head, which very materially adds to the strength of the machine. Model 49 is in every way a desirable mount and at its new price will be a quick seller.

# Don't Waste Your Energies

in trying to sell bicycles that are "Just as good, but not so well known." The better known an article is, the easier it is to sell especially when offered at popular prices.

## The Columbia Chainless, \$75

is within the reach of almost everyone. That it is superior to any chain-driven wheel is no longer open to argument. Any unbiased person who has ridden the Columbia Chainless 100 miles or over will testify to this.

## The Best Columbia Chain Wheels, \$50

Models 57 and 58 are new 1899 models. We have no "SPECIALS" with higher list prices. Every advanced idea that can aid in bringing the chain-driven bicycle to the highest point of development is expressed in these two models. Improved flush joints, wheel base affording room for sprockets as large as may be wished, special cutting of the sprockets to guard against loss of power through sliding of the chain, internal expanders at head and seat post, improved finish, with black enameled gold-striped rims are a few of their good points.

**Hartfords, \$35      Vedettes, \$25, \$26**

# Hubs

TO SMALL  
MANUFACTURERS  
AND  
REPAIRMEN :

We have just finished up about one thousand pair of Shirk Hubs and Two-piece Hangers. We have materially improved on the original Shirk construction. The goods are made right and finish is perfect.

The hubs once adjusted are always adjusted. Axles removed without interfering with adjustment of bearings. Front wheel put in or removed without spreading forks, disconnecting chain, or affecting alignment of wheel. 5-16 balls front and rear.

# HANGERS

The hanger is a marvel of mechanical perfection and especially adapted for repairmen. Its use will characterize a wheel as of the highest grade and add at least \$10 to its selling price. Do not complete your arrangements until you get full particulars and prices. Will have goods on exhibit at space 34, Chicago Cycle Show.

BURNS ACETYLENE GAS

WRITE US FOR DETAILS.

Edward Miller & Co. Meridan, Conn.

A LITTLE TALK ABOUT ACETYLENE LAMPS.

At the beginning of the season just passed there were sixteen Carbide Gas Bicycle Lamps offered to the purchasing public, each individually claiming to be the greatest and only perfect lamp on earth. Many of them possessed marvelous attachments for regulating the flame, purifying and cooling the gas, automatic self-acting water valves, anti-explosive attachments, smoke consumers, refrigerator coolers, safety valves, etc. They all fell by the wayside and demonstrated their inability to work before the season was one-quarter advanced, with the exception of the Electro, which was universally conceded to be a decided success and the best all-around lamp on the market, and one other.

A Carbide Lamp that will burn perfectly and is easily managed and regulated by a novice is a more difficult article to construct than most people are aware of. Aside from the mechanical ingenuity, which, of course, is an absolute necessity, the inventor requires a wide range of knowledge as to the peculiarities and characteristics of carbide gas, which can only come through long and intimate association with it. Any bright designer can make a lamp on paper that looks remarkably well, and theoretically will work to perfection. The carefully made, hand constructed model will work nicely on one's desk; but a lamp that can be turned out from the factory by the thousand, and each and every one work satisfactorily on the wheel of a rider, who, as in most cases, has little if any ingenuity, is a vastly different proposition which most manufacturers have discovered to their sorrow.

The Electro Lamp Co. feel that they have now struck the key note in their new 1899 model of the Electro, which they are now introducing to the trade through their exclusive selling agents. Their lamp of last year, as we remarked before, was the success of the season. They sold 15,000 of them in the city of New York alone that are now in the hands of delighted riders. One year's experience, however, has developed the fact that while the lamp was universally admired and eagerly sought for, there was still opportunity for improvement. They discovered a few weak points mostly in the lack of strength in construction, which they have entirely remedied in their new model. Several new features advantageous to the lamp have been added, in the way of an aluminum reflector and a new method of conveying the water direct to the carbide in such a manner that the lamp may be jarred or jolted over any form or condition of road bed, and the flame will still maintain its uniform height. In fact the lamp as it now stands represents the acme of perfection. Beautiful in construction and finish; small in size, weighing less than a pound; particularly strong and serviceable; and certain to give absolute satisfaction wherever it is introduced.

The only way to thoroughly appreciate our lamp is to order a sample, test it in a practical way, and you are certain to become an enthusiastic admirer.

Any jobber who handles the Electro may have the satisfaction of knowing that a dozen lamps shipped to a customer means a dozen sold, and that his response to his bill for the same will be a check for settlement in full, and not returned lamps as payment, with the comment that they are worthless and can't be sold. He will have an appreciative customer on his books who will be constantly sending in re-orders, rather than an indignant one who feels he has been imposed upon, which is certain to be the case if worthless lamps are shipped him.

Our advice to the trade is, don't buy any Carbide Lamps, the Electro included, until you find out positively by actual test that the lamp works satisfactorily, and will do what its makers claim for it. It is generally conceded by people who know a thing or two in the bicycle business that the Carbide Lamp is the coming lamp, and their trade this season will undoubtedly be far in excess of the oil lamp trade; except in the case, perhaps, of very cheap ones.

One important item for consideration with the jobber is the fact that the Electro Co. this season have two large factories which will be devoted entirely to the manufacturing of their lamp. This will place them in a position to fill heavy orders, which they are certain to receive, and to fill them promptly, and at the same time keep pace with duplicates as the season advances. They have lamps in stock to-day and their factories are turning them out at the rate of 3,000 per week, with the possibility of increasing their output if the trade demands. Last year they were handicapped by having only one factory, which accounted for their inability to fill more than one-half of their unsolicited orders, and their apparent lack of energy in making no attempt to introduce the Electro outside of their immediate vicinity. Prices are certain to be sustained, as there is but one source of supply, and they have a thorough appreciation of the importance of so doing. You will notice that there are three exclusive distributing agents. All correspondence relating to the Electro, samples, electrotypes, printed matter, etc., can be addressed to the concern who handles the lamp in the territory in which you reside.

Our carbide cartridges for the coming season will be put up in such a manner that their con-

Mention The Cycle Age

tents will not deteriorate or evaporate by being carried too long in stock, which was a source of more or less annoyance during the past year.

An additional feature of importance is a metallic cartridge that can be reloaded with any form of loose carbide which will appeal to the rider who appreciates economy more than convenience and absolute cleanliness, which is the beauty of our other cartridge. Our reloading cartridge, however, is a vast improvement over the old method utilized by some makers of using loose carbide in the base of the lamp. Those who have attempted to clean such a lamp preparatory to reloading, realize what a nauseating job it is to the cleaner, as well as suffering the loss of the companionship of friends, who decide to withdraw from the building or immediate vicinity until the operation is complete

and the atmosphere has a chance to clear itself.

We want a few good jobbers in each state who will take hold of the Electro energetically. We do not care to sell too many in the same vicinity, as it only results in price-cutting, and retards rather than aids the welfare of the lamp.

The season is rapidly advancing, and now is the time to come to a decision as to what carbide lamp you are going to handle. It costs no more to have a lamp that you can rely on and have absolute confidence in, than it does to gamble in uncertainties. The Electro has been tried and never found wanting. The new lamp is far better than the old one, and to make a long story short, why not send us your order for a sample lamp immediately?

## LEADING TOE CLIPS:

Nothing has been produced in the way of toe clips that has given such

universal satisfaction to the trade as the clips manufactured by us. Their success is assured. They are therefore offered for the season of '99 ABSOLUTELY WITHOUT CHANGE IN DESIGN, MATERIAL OR WORKMANSHIP. We also manufacture a line of LAMP BRACKETS for head and fork attachment, plain steel and wire TOE CLIPS, CYCLE FLOOR STANDS and the WEBER NEW DEPARTURE LUGGAGE CARRIER. The value offered in this line is recommended to the attention and scrutiny of the jobbing and wholesale trade, whose correspondence is invited. When writing mention this paper.

## Fittings In Sets

You can't afford to buy the "stereotyped" frame sets for sale everywhere. What you want is "talking points." Be distinctive and keep ahead.

**B. E. HARRIS & CO.**

Mention The Cycle Age CHICAGO

## CALLS INSTANTANEOUS REPAIR TOOL

Cures punctures quicker and better than any other device on the market. CAN BE CARRIED IN THE VEST POCKET. All you need besides the tool is a common rubber band, push it through the puncture and pinch the little clips, the rubber band slips off and tire is mended. We wish to call particular attention to the fact that **Calls Instantaneous Repair Tool does not enlarge the puncture.**

With each tool we send 1/2 doz. rubber bands and one tube of best cement. Price complete, 50c. Discount to dealers.

## YOUR '99 TRADE WILL WANT AN EASY RUNNING and DURABLE CHAIN

In our new **Twin Roller Chain** the rocker joint eliminates the friction from this point while the friction between chain and sprockets is avoided by the rollers which turn as the chain feeds off and on the sprockets. This gives you a frictionless and hence a durable chain.

This chain fits the standard 1-in. pitch sprockets and runs smoothly and noiselessly even in mud, water or dust. It makes friends wherever used and will be a great favorite for '99. Write for prices and full description.

MORSE CHAIN CO., TRUMANSBURG, N. Y.

READING STANDARD

READING STANDARD

## Investigation Wanted

**E**VERYONE can claim to have the finest line of Bicycles. READING STANDARD BICYCLES are sold on their merits solely, and the dealer who has not seen our line wishes he had. You can't afford to pay for the "nameplate," or excessive advertising and luxurious salaries, teams or other remnants of a golden past, without adequate compensation. If you do it, you lose at least the difference of what you might make, but don't. We think you want "quality," but you don't care to pay two prices instead of one, and maybe you don't. What you want to pay for is the best and most up-to-date Reliable Bicycle produced at the lowest moderate cost by skilled mechanics in an up-to-date and completely equipped factory, built for building bicycles economically. You can't find better material in the highest priced bicycles nor get better results than you do with "Reading Standards."

When you buy other goods you examine the quality and pay a corresponding price. You don't pay an excessive price because Mr. So-and-So makes the goods. You don't love him quite that much. Oh, no! you are not in business for love or your health. You say, "Mr. Dealer, if you are in business for profit and don't care to rob your customers, but keep their trade and good will by giving them goods worth the price, made by a reliable and responsible firm, you will not pay for the nameplate nor the goods any more than they are really worth." You will investigate and compare without prejudice. And we predict as the result that there will be one more satisfied Dealer added to the list of "Reading Standard Agents"—the agents who report no decrease, but an increase in business, in profits, and in satisfied customers. What are you in business for? Will you investigate, or don't you care to find out? If you do, write us.

Reading Standard Mfg. Co., Reading, Pa.

# Did You Ever Think?

When riding a bicycle did it ever occur to you how much the little steel balls and smooth bearing cups and cones had to do with your enjoyment? If you had ridden in the early days of cycling before these wonderful ball bearings were invented you would appreciate the full force of this inquiry. While all ball bearings may safely be said to be better than plain bearings, there is a vast difference in the results that are obtained. The curve of the cones, the shape of the cups, the points of contact of the balls, all are matters of the most vital importance if we wish to obtain the best results. In Tribune Bicycles these details are figured with the most careful exactness. The balls bear each on two points diametrically opposite and the curve of the bearings is such that no friction is caused by their movement around the cones. We illustrate herewith the various cups and cones used in a Tribune Bicycle, and would recommend all purchasers to examine these important parts before deciding on a wheel.

# High Pressure and Red Cross

**T**HE National Cement & Rubber Manufacturing Company, of Toledo, Ohio, has just completed a mammoth deal by which the entire Stock, Good Will, Trade Marks, Patents, Patterns, and everything connected with the Red Cross Rubber & Cement Company, of Rochester, N. Y., is absorbed by consolidation by the Toledo company.

...WE'VE  
GOT IT ALL

BIG FELLOW (Toledo concern): Well, it's all over, and we are good friends, at least.

LITTLE FELLOW (Rochester concern): You've proved too aggressive a competitor for us; we long since discovered that the "High Pressure" people were gradually but surely securing the lion's share of trade everywhere we went.

BIG FELLOW: But Red Cross originated in Toledo, you know, and will feel very much at home there.

LITTLE FELLOW: True; and we realize that while as a competitor, you practically vanquished us, yet you were an honorable business rival, and never turned a scurvy trick against us.

BIG FELLOW: Well, we'll combine our forces, and our united strength will be too formidable for any adversary to worry us in the least. But hereafter we'll simply do business under the one name—The National Cement & Rubber Manufacturing Co.

LITTLE FELLOW: Agreed.

The Red Cross people will go out of business as a firm at once, and in a week we shall be able to ship all orders for Red Cross brands of goods from the Toledo factories. Everything not disposed of by immediate shipment from Rochester on orders already booked will be shipped to Toledo, and in future all contracts and business will be transacted from this office. All mail to either Red Cross or High Pressure concerns should come to us. We now represent the most powerful combination for the manufacturing of these brands of Cements, Brazers, Vulcanizers, Enameling Ovens, Varnishes, Rubber Paints, Graphites, Etc. in the world. Send for Catalogue. Free to all.

The New Christy Adjustable Saddle.

# THE CHRISTY SADDLE

is sure profit for the retail dealer. It was the original anatomical saddle and is better advertised and better known than any other kind. You run no risk when you carry the Christy. Why load up with imitations?

Spalding's Bicycle Sundry Catalogue Free.

Four Styles: Men's, Women's, Racing, and the New Christy Adjustable.

## THE SPALDING POLICY

of selling direct to the retail trade, large and small, at one price, and requiring the retail dealer to sell to the consumer at one price—no more and no less—is a winning policy and one that should certainly please the retail dealers. This plan is the retail dealers' salvation, as they are at last assured of getting athletic goods from a maker who will not permit price cutting on restricted goods.

If you approve this policy, correspond with us. We want to serve you,

## The Christy Racing Saddle

is the best saddle ever devised for racing purposes. The long pommel enables the rider to retain a firm hold in a sprint and thus prevent wobbling at a critical moment. Used by Bald, Cooper, Kiser, Gardiner and all the prominent riders.

# IT IS NOT TOO LATE TO ORDER ELFIN JUVENILES

Indeed, it is never too late to order a wheel that sells itself. Our factory is being taxed to fill our orders, but we can take care of a few more. The people appreciate the Elfin's points. The reversible crank-bracket, that allows an adjustment to suit a rapidly growing youngster, has made a popular impression that can't be overlooked by dealers.

## We Quote

an extract from a catalogue just at hand of a well known manufacturer of the bevel gear type of chainless bicycles, on the necessity of ADJUSTMENT in all forms of gears.

"The reader is doubtless a bicycle rider and the possessor of a first-class bicycle, having ball bearings, perfect bearings. The balls hard as glass and the cones and cups properly tempered. The bearings doubtless run perfectly, give satisfaction, and are as good as can be made. DID YOU EVER ADJUST THOSE BEARINGS? Would you buy a bicycle having no provision for the adjustment of its bearings? Would you buy a chainless bicycle, whose gears are pins or rollers, with no provision for adjustment or taking up the wear, because you were told that no

wear will occur and no provision is necessary? What a fine rattle trap you would have in the course of six months! Ball bearings, universally used in cycle construction, and recognized by everybody, mechanical or un-mechanical, as being the perfection of simplicity and durability, minimizing friction, wear and trouble, require adjustment, as is well known. Any piece of mechanism that performs work or transmits power will sooner or later require adjustment, if used at all, and when said adjustment is not provided for, the so called mechanism is simply a trap."

### NOW READ

our advertisement in this paper of February 2nd and draw your own conclusions as to the superiority of the Bullis Ball Gear over all others.

"What Would you think of a Bearing Without an Adjustment?"

All forms of roller gears are in this class but ONE—The Bullis Ball Gear. "The Ball Bearing Gear" has an independent adjustment of every ball and cone. No rattle. Purely rolling contact. Friction eliminated. Write us.

1899 A COLUMBIA AND HARTFORD YEAR 1899

COLUMBIA, MODEL 57

*Columbia*  
Hartford and Vedette  
BICYCLES

COLUMBIA, MODEL 58.

The demand for the 1899 Columbias, Hartfords and Vedettes is entirely without precedent. In order to meet it we are running the largest bicycle plant in the world 22 hours a day. The fact that we are obliged to do this tends to show the extent of public confidence in our machines. It also enables us to reduce the cost of production while advancing the quality of our machines. We are sharing with the public the advantage gained by thus operating our factories to their full capacity and it was with a gratification which was shared by thousands of wheelmen that we first announced the 1899 Columbia and Hartford prices which bring the standards of bicycle quality within reach of all. This great demand is but a natural outgrowth of the unequalled combinations of quality and price which we are offering.

COLUMBIA BEVEL-GEAR CHAINLESS, MODEL 59.

COLUMBIA BEVEL-GEAR CHAINLESS, MODEL 60.

Columbia and Hartford improvements for 1899 are notable both in regards number and character. In no previous year have we been able to announce so many improvements of direct practical value to the rider. In the making of these machines no ground once gained has ever been lost; no satisfactory device has ever been discarded for something inferior and nothing new has ever been adopted until proved desirable by the most thorough laboratory and practical tests. Thus has the quality of our product been advanced year by year. Well-informed riders know something of our methods. They have heard of the exhaustive laboratory and road tests to which each of our new models is subjected before being placed on the market. They know that there is satisfaction in riding a Columbia or Hartford.

# AN EXTRACT

"Of all the bicycles made and sent from the Chicago market the greatest bargains are those offered by the Chicago Tube Co. Their 28-inch, 30-inch and 3-crown wheels with Fauber one-piece hangers beat them all. They are up to date in design and equipment and are exceedingly highly finished, and their agents control the market with them in their respective territories."

IN ADDITION to bicycles referred to in above extract from a letter by a prominent dealer we make and sell frame sets and frames and also all material to build or to repair or to equip a bicycle, and have, for the past six years, a constantly increasing business, and are in a position to give the best for the least money. Particulars, catalogue, etc., to any address.

# J. P. Thomas Revolving Hubs and Hangers

HIGHEST GRADE EVER PRODUCED.  
DOUBLE BALL BEARINGS.

Patented in U. S. Dec. 23, 1897

Inner revolving sleeve, gains 40 per cent in speed with the same power, or rides 40 per cent easier. Notice the dustproof cap, patent oil feeder and other details of construction. It has been admitted by the most critical that this is the best and most scientific bearing ever produced. The great demand for a better article has made it necessary for all first-class manufacturers to adopt our bearings, as the public is willing to pay the additional cost.

Patented in U. S. Dec. 23, 1897.

The J. P. Thomas Revolving Hubs and Hangers have been on the market only since December 22nd, 1898, and we are now receiving orders from all parts of the country. To any manufacturer who has not yet adopted our Hubs and Hangers we shall be glad to send sample set C. O. D. on approval.

## J. P. THOMAS & CO

Office and Salesroom: 439-441-443 THIRTY-FIRST STREET

CHICAGO. ILLS., U. S. A.

### To the Trade.

I beg to call your attention to the merits of an improved ball-bearing, patented to me April 19, 1898. The objects sought are to give a better support to the ball so that the pressure will at all times be perpendicular to the surface of the ball, thus eliminating the wedging tendency of ordinary bearings which often splits the cup, and also to provide better oiling facilities.

To secure a better bearing surface for the balls, the cone and cup are both provided with raceways or rolling surfaces for the balls, which are

curved to as near the shape of the ball consistent with allowance for adjustment, and extend about a considerable portion of the surface of the cone part.

As a consequence, if the bearing is a little loose or any side strain is brought upon the wheel, there is a slight corresponding rolling of the ball, which keeps the pressure perpendicular to the surfaces. The ball can thus never act as a wedge to increase the strain and crack the cup or cone, or run on the shank of the cone if the bearings are loose, as the cone carries the balls—see cut. The bearings are two point contact.

From the inner side of the cup projects a flange which is cupped or reduced in diameter and acts as a receiver for the oil which lubricates the bearings. A reservoir for the oil is provided by the tube which surrounds the axle and central hole in this axle. This provides a large storage capacity for oil. The felt washer also strains the oil before delivering it to the bearing. In this way I secure a large oil storage capacity and a feed from the center outward, and the felt washer prevents the oil from carrying dirt into the bearings, and oils the bearings automatically. This is much superior to the ordinary oil feed tubes, as the position of the wheel does not affect its working.

I hope that my invention will commend itself favorably to you and that I may hear from you concerning it. It is my desire to arrange for selling the patent or for manufacturing on royalty. Yours truly,

FRANK GUSTAVESON, = Wabasha, Minn.

S. & G. Stirrup Toe Clip.

Pat Feb. 7, 1899

The most popular Toe Clip ever put on the market. Over one hundred and eight thousand pairs sold in 1898. Price per pair, 50 cents.

PATENT APPLIED FOR. SIDWAY MFG. CO., Chicago, Ill., U. S. A.

## CALLS INSTANTANEOUS REPAIR TOOL

Cures punctures quicker and better than any other device on the market. CAN BE CARRIED IN THE VEST POCKET. All you need besides the tool is a common rubber band, push it through the puncture and pinch the little clips, the rubber band slips off and tire is mended. We wish to call particular attention to the fact that Calls Instantaneous Repair Tool does not enlarge the puncture.

With each tool we send 1/2 doz. rubber bands and one tube of best cement. Price complete, 50c. Discount to dealers.

J. H. Burt Mfg. Co.

## The Kelly Pneumatic Tire Repair Tool.

Patented Dec. 20th, 1898, and Jan. 17th, 1899. No. of patents, 616,109 and 617,810.

The quickest and best device for the purpose on the market. It positively will not pull out rubber bands with needle no matter what size the puncture may be. It is the only tool that will repair punctures after glycerine or any other anti-leak solution has been used. It can be used any place. So simple a child can use it. So small and compact it can be carried in the vest pocket, the size being 3 1/2 inches long. This tool is put in an enameled tin box with rubber bands, cement and directions.

Sample by mail 35 cents. Special prices to dealers, jobbers and manufacturers. Manufactured by

THE KELLY MFG. CO.,

71 TO 9, PAYTON STREET, GREENTOWN, - - - INDIANA.

Also manufacturers of the Whisler Tire, Metal valve-stem, Inserting tool, and The Gibson Jewsharp Spoke Wrench and other small bicycle sundries.

## By Using a Bi-Gear....

you can make your last year's bicycle into a new one, if you do not intend buying a '99 model wheel. In fact, the BI-GEAR gives you two bicycles to ride at the same time: viz, a high or regular gear, and a 20 per cent lower gear to be put into use instantly while riding, when wanted. The BI-GEAR doubles the pleasure of tandem riding, and if it will stand the wear and tear of the double machines, it certainly will do so on single wheels. Can coast without the chain revolving.

Price Reduced to \$15.00.

Exclusive territory to good agents. Liberal discounts to the trade. We also make the

"SURE THING" TIRE MENDER,

the simplest, cheapest, most convenient vest pocket emergency repair kit. No cement necessary. Rubber bands and the proper tool for putting them into place. Send for sample. Postpaid 10 cents.

BROWN-LIPE GEAR CO., - Syracuse, N. Y.

## LEADING TOE CLIPS:

Nothing has been produced in the way of toe clips that has given such

universal satisfaction to the trade as the clips manufactured by us. Their success is assured. They are therefore offered for the season of '99 ABSOLUTELY WITHOUT CHANGE IN DESIGN, MATERIAL OR WORKMANSHIP. We also manufacture a line of LAMP BRACKETS for head and fork attachment, plain steel and wire TOE CLIPS, CYCLE FLOOR STANDS and the WEBER NEW DEPARTURE LUGGAGE CARRIER. The value offered in this line is recommended to the attention and scrutiny of the jobbing and wholesale trade, whose correspondence is invited.
